**MARAVILLA COCOA.**—No breakfast table is complete without this delicious beverage. *The Globe* says: "Various importers are acknowledged by 160 engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not run or gum, and will pay for themselves in a short time, in the saving of oil, over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First street, San Francisco. 8/23-3m

**PSYCHOMANCY.**—Any Lady or Gentleman can make \$1,000 a month, secure their own happiness and independence by reading Psychomancy, Fascination or Soul Charming, 400 pages. Full instructions to use this power over men or animals at will, how to mesmerize, become France or Writing Mediums, Dyrmatism, Spiritualism, Alchemy, Philosophy of Omens, and Dreams, Brigham Young's Harem, Guide to Marriage, &c.; 200,000 sold. Sent by mail for \$1.00 or \$1.25, per copy. S. B. The Philonix Star speaking of the book says the author is HERBERT H. ALTON, B. A., the celebrated Psychological Lecturer, and the publisher, T. W. EVANS, one of the oldest Perfumers and Publishers in the city. The reputation of whose name is a sufficient guarantee of the merits of the work. MR. EVANS has spent \$90,000 already in advertising and getting out this extraordinary book. Skeptics in Psychology read and he convinced of its worth.

**NOTICE.**—Any person willing to act as Agent will receive a sample copy FREE. As no capital is required, all kinds of goods can be sold, and sent for by order, enclosing 5 cents for postage, to T. W. EVANS, 418 Eighth street, Philadelphia, Pa. ma1-lam3t

Wax Side Leather, 1/2 foot 1 50c/0 29

### Special to Inventors.

All inventors who secure valuable patents through the SCIENTIFIC PRESS PATENT AGENCY are specially favored with a liberal notice of the merits of their inventions in the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS—two first-class weeklies, the most widely circulated of any on this coast, reaching the very best classes for the benefit of our ingenious citizens. In many cases we know that such notices have been worth more to patentees than the whole cost of obtaining patents. While we give the most able and experienced counsel to inventors, our terms are more favorable to Pacific Coast inventors than those of any other Agency in the United States, besides the benefit derived from having their inventions set forth rightly in the start by gratuitous publication in more than one highly reputable journal.

### THE QUARTZ OPERATOR'S HAND-BOOK,

BY P. M. RANDALL

REVISED AND ENLARGED EDITION.—1871.

#### CONTENTS:

APPLIED MECHANICS—Thin Cylinders, Thick Hollow Cylinders, Relative Grinding Capacity of differently formed Grinding Plates, Friction, Water Pipes, Velocity of Streams, Water Power, Water Wheels, Steam Power, ASSAY—Mechanical Assays, Dry Way of Assay, Humid Way of Assay, Assay or Analysis of Iron Ores containing Manganese, Assay or Analysis of Ores containing Gold, Silver, Copper, Lead, Iron and Sulphur. BEHAVIOR OF SOLUTIONS OF METALLIC OXIDES WITH REAGENTS—BLOW-TUBE—EXAMINATION OF MINERALS. GOLD—Treatment of Ore Containing Gold: By Smelting; By Amalgamation; By Chlorination. MILL-STAMP—SLIVER—GOLD. MINERAL VEINS—Species of, Formation of, Exploration of, Exploitation of. MIVES—VENTILATION. QUARTZ MACHINERY—Rock Breakers, Batteries, Mortars, Tappets, Cams, Cam-Shafts, Stamps, Dies, Serpens, Guides, Grinders and Amalgamators, Wheeler & Randall's Excelsior Grinder and Amalgamator, Separators, Wheeler & Randall's Manual Separator, Concentrators, Wheeler & Randall's Eureka Concentrator, The Wheeler and Randall Tabular Concentrator and Amalgamator, Retorts, Cold Retorts, Silver Retorts, Crucibles, Ingots Molds. REDUCTION AND CONCENTRATION OF ORES—DRY WAY. ROASTING—Heaps, Furnaces. SINTERING. SILVER—Ores of Silver, Treatment of Silver Ores: By Smelting; By Solution; By Amalgamation; Extraction of Silver from coarse Copper, Extraction of Silver from Copper Matte, Sodium Amalgam, Purification of Mercury, Quicksilvering of Copper-Plate, Cupellation of Gold and Silver, Refining of Gold and Silver.

SOLD, Wholesale and Retail, at publishers' rates, by DEWEY & CO., PROPRIETORS SCIENTIFIC PRESS, Patent Agents, Engravers and Publishers, San Francisco. Cloth bound, 175 pages. Price, \$2.

### Phelps' Patent Animal Trap,

FOR GOPHERS, SQUIRRELS, RATS, CATYOTES, and other "Varmints."

This Trap, as may be seen, is of simple construction, and not likely to get out of order, and very durable.

#### It is Very Efficient

and can be used conveniently by women or children. THE CHEAPEST AND BEST YET INVENTED. Price 50 cents. By mail, prepaid (to place where express charges are high), \$1. A liberal discount to clubs or dealers who buy by the dozen. Address the inventor and manufacturer, D. N. PHELPS, al-ly-awbp

#### San Leandro, Alameda County, Cal.

**BETT'S CAPSULE PATENTS.**  
To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, that BETT'S NAME is ON EVERY CAPSULE he makes for the principal merchants in England and France, thus enabling the vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsules are not used merely for the purpose of the ornament but that they are serviceable in protecting the wine from injury, and insuring its genuineness. MANUFACTURERS:—L. WILKIE ROAD, CITY ROAD, LONDON, AND BORDEAUX, FRANCE.

## Mining and Other Companies.

Being the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press early, and therefore, which is the very best, we can credit our subscribers.

## Bellevue Mining Company—Location of

works, Ophir District, Placer County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of August, 1871, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 409 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 31st day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 23rd day of October, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees, T. F. CHONISE, Secretary. Office, 409 California street, San Francisco, Cal. a2-19

## I. X. L. Gold and Silver Mining Company.

Location of works, Silver Mountain District, Alpine County, Cal. Notice.—The annual meeting of stockholders of the I. X. L. Gold and Silver Mining Company, for the purpose of electing Trustees for the ensuing year, will be held at the office of the company, Pioneer Hall, 20 Montgomery street, San Francisco, California, at 2 o'clock, P. M., Thursday, Sept. 11, 1871. J. F. WILSON, Secretary.

By order of the Board of Trustees, F. J. HERMAN, Secretary. Office, 316 Kearny street, San Francisco, Cal. a2-14

## HYDRAULIC CHIEF.

FISHER'S KNUCKLE JOINT AND NOZZLE.

## ALL KINDS OF MACHINES

Built to order, and Repairing done promptly.

## NOZZLES TURNED OUT AND FITTED FOR ALL MACHINES AT

F. H. FISHER'S Sacramento Street Machine Shop.

## HYDRAULIC MINERS, TAKE NOTICE.

The notice published by R. R. and J. Craig, that they have suits pending in the United States District Court, which involves the working principle of my HYDRAULIC CHIEF, is false. I caution all miners to beware of the efforts of the said Craigs to intimidate my patrons or extort money from them by false representations. I have a full patent for my Hydraulic Chief, granted December 20th, 1870. No. of patent, 110,222.

F. H. FISHER, Nevada City, Cal.

## LEA &amp; PERRINS' CELEBRATED

## Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivaled. Condition having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA &amp; PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take legal proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA &amp; PERRINS' Sauce and see names on wrapper, label, bottle and stopper.

Wholesale and export by the Proprietors, Worcester; Croese and Blackwell, London, E.C. and by Grocers and Oilmen universally. Agents, CROSS &amp; CO., San Francisco. 1v22-lyeow

## 7-30 GOLD LOAN

OF THE

## Northern Pacific Railroad.

RAPID PROGRESS OF THE WORK.

The building of the Northern Pacific Railroad (began July last) is being pushed forward with great energy from both extralimits of the line. Several thousand men are employed in Minnesota and the Pacific road. The grade is nearly completed 266 miles westward from Lake Superior; trains are running over 130 miles of finished road, and track-laying is progressing at the rate of one to two miles per day. Including its purchase of the St. Paul &amp; Pacific Road, the Northern Pacific Company now has 413 miles of completed road, and by September 1st will have increased to at least 560.

A GOOD INVESTMENT. We are now selling, and unhesitatingly recommend, as a profitable and perfectly safe investment, the First Mortgage Land Grant Gold Bonds of the Northern Pacific Railroad Company. They have 30 years to run, bear Seven and Three-tenths per cent. gold interest (more than 8 percent. currency), and are secured by first and only mortgage on the ENTIRE ROAD AND ITS EQUIPMENTS, and also on

23,000 ACRES OF LAND to every mile of track, or 500 Acres for each \$1,000 Bond. They are exempt from U. S. Tax; Principal and Interest are payable in Gold; Denominations: Coupons, \$100 to \$1,000; Registered, \$100 to \$10,000.

LANDS FOR BONDS. Northern Pacific 7-30's are at all times receivable at TEN PER CENT. ABOVE PAR, in exchange for the Company's Lands, at their lowest cash price. That is, in addition to their character as a first-class, prompt-paying Railroad security, these Bonds are in effect Land Warrants bearing a profitable rate of interest until exchanged for Homesteads, at TEN PER CENT. PREMIUM.

SINKING FUND. The Land Grant of the Road exceeds Fifty Million Acres, having an average soil of great fertility, in a climate that is simply unsurpassed.

The Trustees of the Mortgage, Messrs. Jay Cooke and J. Edgar Thomson, are required to devote the proceeds of all Land Sales to the repurchase and cancellation of the Company's Bonds. This immense Sinking Fund will undoubtedly cancel the principal of the entire issue of First Mortgage Bonds (now selling) before they fall due. With their ample security and high rate of interest there is no investment accessible to the people, which is more profitable or safe.

EXCHANGING U. S. FIVE-TWENTIES. In view of the Government's expectation soon to call for the surrender of its outstanding 5 per cent. Bonds, under the present movement for funding the debt at lower interest, many holders of United States Five-Twenties are exchanging them for Northern Pacific Seven-Thirties, thus realizing a handsome profit, and greatly increasing their yearly income.

OTHER SECURITIES—AGENCIES. All marketable Stocks and Bonds will be received at their highest current price in exchange for Northern Pacific Seven-Thirties. EXPRESS CHARGES on Money or Bonds received, and on Seven-Thirties sent in return, will be paid by the Financial Agents. AGENCIES for the sale of this loan are established in nearly every city and important town throughout the United States and Canada. Full information, maps, pamphlets, etc., can be obtained on application to any agency, or from the undersigned.

For Sale by

JAY COOKE &amp; CO., Philadelphia, New York and Washington.

Financial Agents Northern Pacific Railroad Co.

By Banks and Bankers generally throughout the country. mar25-13t-cow

POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE

MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v23-3m JOHN F. LOISE, Secretary.

MENZO SPRING,

Manufacturer of Dr. Douglas Bly's

Patent Artificial Limbs,

S. W. corner Second and Jessie Streets, San Francisco.

All other kinds changed and repaired. The late improvements on the Dr. Bly Limbs, especially his two best Legs (one with the other without lateral motion at the ankle joint), make them far superior to all other Artificial Legs in use.

For particulars call or send for circular. Circulars sent free. Address MENZO SPRING,

11v23-3a 101 Jessie street, San Francisco, Cal.

## TARRANT'S SELTZER

APERIENT

The Great Equivalent.—The world may be safely challenged to produce so perfect a simulation of any thing in nature, as

Tarrant's Seltzer Aperient

Is of its original, the Seltzer Spring of Germany. The Aperient, based on a correct analysis of the Seltzer Water, is even superior to the manufacture of Nature herself, because it contains all the active medicinal properties of the spring, unalloyed by any of the inert and useless particles found in all mineral fountains. THE GENUINE ARTICLE BEING SECURED, you have the Seltzer Water of Europe, purified and perfected, and probably the best, the most genial, cathartic and antibilious preparation on the face of the earth.

SOLD BY ALL DRUGGISTS.

TARRANT'S SELTZER

APERIENT

At the commencement of the Diarrhea, which always precedes an attack of the Cholera, take a teaspoonful of the Pain Killer in sugar and water (hot, if convenient), and then bathe freely the stomach and bowels with the Pain Killer, clear. Should the diarrhea or cramps continue, repeat the dose every ten or fifteen minutes until the patient is relieved. In extreme cases, two or more teaspoonfuls may be given at a dose.

The Pain Killer, as an internal remedy, has no equal. In cases of Cholera, Summer Complaints, Dyspepsia, Dysentery, Asthma, it cures in one night, by taking it internally, and bathing with it freely. Its action is like magic, when externally applied to Old Sores, Burns, Scalds, and Sprains. For Sick Headache and Toothache, don't fail to try it. In short, it is a PAIN KILLER.

Directions accompany each bottle.

The Pain Killer is sold by all dealers in Medicines.

Prices, 25 cents, 50 cents and \$1 per bottle.

PAIN KILLER PROP.

PENNY DAVID &amp; SON, PROVIDENCE, R.I.

1840 1870

CHOLERA.

HOW TO CURE IT.

At the commencement of the Diarrhea, which always precedes an attack of the Cholera, take a teaspoonful of the Pain Killer in sugar and water (hot, if convenient), and then bathe freely the stomach and bowels with the Pain Killer, clear. Should the diarrhea or cramps continue, repeat the dose every ten or fifteen minutes until the patient is relieved.

## THE HESSE GRINDER AND AMALGAMATOR.

This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

## IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

San Francisco.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION.—D, is a glass chamber which contains the lubricant. C is a valve connecting with cup which introduces the lubricant into chamber D. E, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the ejection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. fell-1f

# THE PATENT Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.  
For further information apply to

### Varney's Patent Amalgamator.

These Machines Stand Unrivaled.  
For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing de- mand for them is sufficient evidence of their merits.  
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:  
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amal- gamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

## Designing and Engraving

By the Best of Artists,  
At this Office.

## To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

### To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., SCIENTIFIC PRESS OFFICE SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS 112 illustrated mechanical movements and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAWS of 1870.

### DEWEY & CO.,

### ACTIVE MEN!

With Experience in Canvassing business, can now obtain lucrative and permanent employment by DEWEY & CO., Patent Agents and Publishers of the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS, No. 414 Clay street, S. F.

## I. N. WILFONG'S

PATENT CIRCULATING

## STEAM BOILER.

This cut represents an improvement on the old style of Cylinder Boiler, and combines all the following great advantages: Rapid circulation and generation of steam; economy in fuel; durability, safety, and simplicity of construction; requires but little attention; is easily repaired, and moderate at first cost.

We have now a number in successful operation, and respectfully refer to the following well known parties: Hastings & Co., Seventh and Olney streets; Joa. Lea & Co., 128 Chestnut street; J. S. Huber, Germantown; Holt & Bro., Sixth and Susquehanna avenue; Albion Print Works, Conahocken, Pa.; S. H. Dickey, Oxford, Pa.—all of which are giving ENTIRE SATISFACTION. Parties wishing to investigate the success of our new Boiler can do so by calling at any of the above named places, or to

### I. N. WILFONG,

131 and 135 North Twenty-second St.,  
PHILADELPHIA, PA.,

Manufacturer of all descriptions of Boilers (Rogers & Black's patent included), Tanks, Stills, Pans, and general Iron Work. Orders solicited from all parts of the country, and, when received, promptly attended to. State and County Rights and Royalties for sale as above. 5v23-6m-cow

## THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

### GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BLANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

20v22-3m16p

BANDMANN, NEILSEN & CO.,  
General Agents, No. 210 Front Street.

The Largest and Best in America.

## The Scientific Press,

Established in 1860, is now the Largest, Most Original, Best Illustrated and most Ably and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of fresh intelligence in a condensed and interesting style, easily appropriated by the reader, who finds its columns replete with new facts and ideas not obtainable in the books of the past or in any one other of the journals of the day.

Varied in its carefully compiled and conveniently arranged departments, representing the special and leading industries of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvements and Inventions—it becomes a weekly informant to all Scientific, Mechanical, Manufacturing and Industrial Progressionists on the coast, an immense list of whom testify to its pleasant, profitable and elevating influence.

The progress of our journal has been steady and unvarying. Encouraged by a liberal class of readers who exhibit their appreciation in a substantial way, we shall, with our increasing facilities, experience and information, make each coming issue superior to its predecessor.

Let every friend of Science and Industry on this side of the continent take pride, not only in sustaining, but accelerating the advancement of a faithful representative of its highest interests by subscribing for it and urging its patronage by others—now, without delay.

Subscription \$4 per annum, in advance.

VOLUME XXIII.  
Number 10.

## EDSON'S STEAM RECORDING GAUGE.

When scientific men attempt to investigate the causes of such boiler explosions as that, the details of which, are harrowing the feelings of the people of New York, one of the first questions after ascertaining that there was plenty of water in the boiler is "what was the real pressure in the boiler at the time of the explosion?" The engineers answer in this case, is "27 pounds." Honest, no doubt, he is, but still his eye was not upon the gauge at the moment when the iron parted, and we are still in doubt about it for want of direct testimony.

In each case we meet the same difficulty. We are told what the pressure was a few moments before the explosion, but what we want to know is the pressure at the last moment. Engineers who are in position and see that, have rarely, if ever, lived to tell the story. To this ignorance of the real pressure, more than any other thing, do we owe the mystery surrounding boiler explosions.

There is nothing that can be brought up in proof, to show that boilers have not been strained by over pressure at some previous time. During the whole life of a boiler except the few minutes while the gauge is under the eye of the owner, we are in almost as much ignorance of the real pressure carried, as people were in the days of Sargy's engine. To this ignorance we owe the continuance of such absurd theories as have recently been ventilated in the columns of the newspapers.

The real want is an automatic registering steam gauge, which shall make a continuous record of every change in pressure, so that at the end of the day, or at any time, we may be able to see every fluctuation that has taken place. The amount of information to be gained from such a record would surprise a person unaccustomed to examining the automatic records of such instruments as the barometer, thermometer and wind gauge.

Who of course feel more confidence in a machine which cannot go wrong, without showing us the cause of the error, than in the most accurate and conscientious observer.

The whole science of meteorology was placed upon a new foundation by the introduction of automatic registering instruments, and why may we not expect a similar advance in steam engineering, when automatic recording steam gauges are generally applied to steam boilers?

The object of the present article is to describe such a gauge and explain some of the things which may be learned from an inspection of these records.

Our first illustration shows a gauge adapted to record all variations of pressure occurring in a steam boiler, or any other vessel subjected to internal pressure.

The gauge is connected with the boiler by means of a pipe which allows the steam to act upon a series of corrugated discs arranged in pairs which are expanded by it. The motion thus produced is transmitted by a lever to a wheel, shown in the engraving. This wheel working in a rack moves the pencil, and with an increasing pressure makes a direct stroke upwards upon the paper. When the pressure falls the paper receives a forward motion and the mark of the pencil is consequently at an angle,—about 30 degrees from the perpendicular, the drum at the right hand side winding up and unwinding the paper from that upon the left. By the side of the pencil is a scale for convenience of

reading the pressure. A single roll of paper will last for months and may then be filed away for future reference. Above the paper is a dial and indicator hand, similar to that of an ordinary pressure gauge. By means of another attachment an alarm gong is sounded whenever the pressure exceeds the maximum determined upon when the gauge is locked. This gong continues ringing for nearly half an hour unless steam is lowered.

The kind of delineation made by the pencil is shown very well in the engraving. If the pressure fluctuates only a few ounces at a time up and down as it often does with each stroke of the engine, the notches of the line drawn by the pencil become so small as to be apparently a horizontal line.

We have before us, while writing, several of these rolls of paper or charts, which are very appropriately termed steam logs. The first is from the boiler of the steam-

longing the voyage, gave a peculiar form to the chart, prolonging that part made outside of the capes. The remaining voyages present nothing to arrest the attention, and we find from the ship's log-book that they were in every way like those we first examined. Such a log is an honor to both engineers and firemen, and gives the owners a comfortable series of security when it passes inspection at the office.

The next chart which we have is from the boiler of a steam cotton press, covering a period of nine weeks. The fires are banked at night, and steam for six nights in the week does not fall below 10 or 20 pounds. The working pressure is about 45 pounds. In this chart the middle of each day is marked by a distinct fall in pressure, showing where work stopped at noon. The greater length of the first or last part of the record for the day shows distinctly whether the greatest part of the

other and make a continuous line. The total rise and fall for both trips was only 5 pounds.

On the sixth trip the changes amount to as much as 7 or 8 pounds, caused, we find, by a change of hands and some other causes. On another trip we find more marked changes, and notice that heavy weather and poor coal have made a good card more difficult. Toward the end of the tenth trip, however, a series of marked movements make a decided change in the character of the chart. It appears that a leak in the boiler made its appearance, and gave constantly increasing trouble. In the next run it became evident that it was difficult to keep the steam up and the average working pressure fell from 30-35 lbs. to 20-25 lbs. and at times even less. The vessel was immediately put upon the dock for repair.

The whole voyage is presented in a tabular form. It can be compared in a moment and at a glance with any other. No interest in one direction or another can warp the indications. The gauge is free from personal feelings, which may influence written log books. The gauge cannot be tampered with in any way, for all its parts including the stop-cock, are secured by the lock which closes the whole instrument.

This gauge is manufactured by the Recording Steam Gauge Co., 91 Liberty street, New York City. It is worthy of note that these instruments are to be carried hereafter on all steam vessels in United States waters, according to the provisions of the new law.

## Mining in Arizona.

Mining in Arizona experience considerable difficulty in carrying on business on account of the Indians. The troubles on that score seem to be increasing instead of diminishing as was expected by the gradual increase of population. Miners have no chance to prospect on account of the danger of attending extended trips at any distance from the settlements. People in Arizona are not free to go where they please as in other countries for fear of molestations from Apaches. They have to stand guard over their stock and other property. It is necessary for escorts to go with every wagon and team on its journey, and the miners and prospectors are compelled to move around in parties, to protect themselves from their wily foes. It is to be hoped that these obstacles will shortly be overcome, and that the large extent of mineral country now lying idle and useless will be accessible to the enterprising pioneers who have settled in that remote territory.

## OUR LANDS AND THEIR CAPABILITIES.—

The proportion of land of California under cultivation, compared with the entire area, is very small. According to Land Office figures, there are 60,000,000 acres capable of bearing wheat, but only 5,000,000 have been taken up, and only 2,600,000 are cultivated. Of this according to the Surveyor-General, 1,263,000 were, in 1869, in wheat, giving 19,000,000 bushels, or fifteen bushels per acre. It follows that if, by means of increased facilities, 15,000,000 acres are in time got under wheat, the crop will be 180,000,000 bushels, or ten times the present average crop, which is raised without irrigation, in sections ill provided with transportation.

EDSON'S STEAM RECORDING GAUGE.

ship Wyanoke, plying between New York, Norfolk and Richmond, Va. It extends from the 29th to the 36th voyage inclusive. By an examination of it we learn many particulars relative to the boilers which even the engineer himself might not have understood. During the first and last part of each trip pressure is maintained pretty regularly at 35 to 40 lbs. In the middle of the trip it sinks to zero, showing the time spent at Norfolk. The average pressure on the run from Fortress Monroe to Norfolk and back is usually ten pounds less than at any other part of the round trip. This is probably accounted for by the still water—river and ocean navigation requiring more power. These characteristics are well preserved during each voyage.

On examining more closely, and comparing one chart with another, we find on the 31st and 32d voyages that the pressure reached its highest point, and yet there seemed to be great difficulty in keeping it there, and the moment the steamer got outside it fell to a point very much below the average. Here was something to be accounted for. Upon inquiry, it is found that the quality of the coal on these trips was not quite up to the average, which, together with some other little things, gave the reasons for these departures from the usual uniformity.

On another occasion a head wind pro-

work was in the morning or afternoon.

In the early part of the season there were several days in which no work was done, though steam was kept up as usual. This is shown by the record—the pressure rising and falling without a vibration. Saturday nights the boiler was allowed to cool and the pencil for the first time in the week reaches zero.

On one day work came in after the steam had begun to run down for the night. This required the fires to be opened, and of course we find a record made of this fact in the shape of a rise in the pressure just after the final fall for night had begun. We find that on another occasion the pressure was kept above 20 pounds all night; this was during the busiest season and only occurred once.

We might thus go on at a much greater length; but another log will be found of greater interest, from the steamship Virgo, running between New York and Savannah. This voyage usually takes three days out and five days return.

During the first trip out and back there was a constant movement of the gauge, amounting sometimes to as much as 8 or 10 pounds. Besides these we have certain other changes in pressure that probably occurred at the changing of the watch. During the next two trips the record is a marvel of accuracy. The fluctuations are so small that they literally run into each

# MECHANICAL PROGRESS.

## To Select Building Stone.

The following instructions for the selection of building stone, are taken from the *London Builder*, and are of great interest to all who may have anything to do with such work:

In selecting a quarry from which to get the stone best suited for the purpose, great care is required. Having first satisfied yourself that stone of the size required, can be obtained, and at a reasonable price, the next and most important step of all, is to find out if it is durable stone. Too much weight must not be placed on the assurance of quarrymen that the bed which is the cheapest for them to get at is the best and most durable—nor the best looking and easiest to work. It does not follow that because certain old buildings, in the neighborhood have lasted well, therefore all the quarries in the neighborhood produce the same stone.

It often occurs that a quarry on one side of a hill produces much better stone than that on the other. Specimens dressed up square, sent out by the quarryman or agent, are very dangerous things to form an opinion on, because what looks very well in small pieces is really often of an inferior quality; and a stone that would appear coarse and rough in a specimen would not do so when in the mass. Stones that rub up to a smooth face are often not so durable as those of a rougher texture.

To give an example, "best bed" Portland is much superior in color and texture to "brown bed" Portland, but far inferior to it in durability. Examine all the different beds in a quarry, noting the particular grain, texture and color of each bed, compare them with the buildings around, and if there be any old quarries near, with the face exposed, see which of the beds stand out the most, and show the old tool-marks, and consequently have yielded to the action of the weather least.

It frequently happens that the best stone is neglected, or only in part worked, from the cost of removing the rubbish with which it may be associated.

As an economical supply of stone in particular localities would sometimes appear to depend on accidental circumstances, such as the cost of quarrying, the degree of facility in transport, and the prejudice that generally exists in favor of a material which has been long in use; and as the means of transportation have of late years been greatly increased, it becomes essential to ascertain whether better materials than those which have been employed in any given place, may not be obtained from other, although more distant, localities, offering equally advantageous terms.

The relative facility with which good materials may be obtained in a district, is to a certain extent marked by the appearance of the towns and villages in it, the comparative cost of obtaining them being in general better shown by the character of the ordinary houses, than by that of the public buildings and large mansions, the stone for which may sometimes have been brought from comparatively considerable distance.

From the frequent practice, however, of selecting those stones which yield readily to the tool, and are hence commonly termed freestones, whatever may be their mineralogical characters, the most durable, and, therefore, eventually the cheapest, are far from being always employed. And it sometimes happens that we find the common cottages built of durable materials, while larger mansions and public buildings are not, the materials for the latter having been selected only because they were so readily worked up for ornamental parts, while those for the former may have been thrown aside in the same quarries because they yielded less freely to the tool.

**IMPROVEMENT IN LEAD PENCILS.**—Mr. Henry T. Cnshman, of North Bennington, Vt., has invented an improvement in lead pencils, which consists in providing them with a coating of flock, by means of which they are less liable to be lost, and more easily handled than those now in use. The pencils are covered with glue or other adhesive liquid, and then coated with flock of any desired color. This gives the pencil a coating which causes it to adhere to cloth, and thereby prevents its sliding or slipping from the pocket. This improvement does not add to the cost of the pencil, as the rough coating may be applied as readily and as cheaply as the ordinary varnish or polish.—*Sci. Am.*

## Selenitic Mortar.

For some months past, a series of careful and exhaustive experiments has been in progress at South Kensington, in order to test the value of a new kind of cement and mortar. This substance is the invention of Colonel Scott, R. E., and has been freely used in the construction of the French annexe. It has been named by Col. Scott selenitic mortar, and the process of production consists in mixing with the water used in the preparation of the mortar, a small quantity of sulphate of lime, in the form of either plaster of Paris, gypsum, or green vitriol. These substances having been intimately mixed, the lime is added and ground with the water or sulphate into a creamy paste. The mixture is prepared in the pan of an ordinary mortar mill, in which the water and sulphate are first introduced, and subsequently the lime. After the lime has been ground for three or four minutes, the sand, burnt clay, or other ingredients are added, and the whole is ground for ten minutes more. By this invention, ordinary lime can be at once converted into a species of cement mortar which sets rapidly and can be used for concrete work, or stuff for plastering at a cheaper rate than that made from lime in the ordinary way. From his experiments, Colonel Scott finds the use of sulphuric acid to give the best results, so that this substance is used in preference to plaster of Paris or gypsum, although the latter materials will answer for all practical purposes. Sufficient acid is contained in plaster of Paris to effect the necessary chemical change, and to prevent the lime from slaking, which in effect is the secret of the whole process. The lime by this means, is enabled to take twice as much sand as when slaked, its fiery nature being brought under control. Any lime can be made selenitic by Colonel Scott's process, and the more hydraulic it is, the better are the results obtained with it.—*Building News.*

## New Kind of Paper Hangings.

A Liverpool paper thus describes a new kind of paper hangings, recently introduced there from Switzerland. The effect must be very fine. "The general character of the design may be styled Florentine; the ground-work is white satin; the walls are divided into compartments by styles of a rich gold color, representing, with great accuracy, carved wood of intricate design; the panels are niches with drawings of deer, lions, swans, etc., each forming a complete picture in gorgeous borders of gilded ornaments and flowers, partaking somewhat of the Louis Quatorze style; the alternate panels comprise a species of flagree work, varied with drawings of flowers and gems, in which gilding is most tastefully and sparingly introduced, the whole being of the most exquisite design and execution. An exceedingly rich border runs round the top of the room, and one of corresponding design round the bottom part. From the judicious employment of French grays and other cool colors, the effect is not in the least gaudy, but at once rich and chaste. The introduction of this paper may be regarded as a new era in decoration, and will do much to relieve us from the sameness and insipidity which pervade even our best houses."

## Breakage of Watch Case Springs.

The breakage of the case spring is one of the most frequent failures which occur in hunting case watches, and is as disagreeable to the owner as to the repairer of the watch. The former has to pay a considerable amount, and the latter gets only a small profit by this repair, because he is very often obliged to put several springs in the watch before one will stand. To obviate this inconvenience, I tried to make the springs of brass instead of steel, and found that, if well hammered, this metal suits perfectly to the purpose. After this, I made all case springs in the following manner: I take a piece of brass wire, a quarter of an inch thick and two inches long, and bend an eighth of an inch, in the vice, to a right angle; then I hammer it alternately on four sides, till it gets a sparkling appearance. This is the sign of the right temper. Then I bring it to the same shape as a steel spring and make it fit in the case.

I will add, that I never saw a spring that was made in this way become weak or broken; and watch makers who will try this method will find that a brass spring is made in half the time that a steel spring is beside saving of files and other tools.—*Cor. Sci. Am.*

# SCIENTIFIC PROGRESS.

**TELESCOPES.**—Until within a very few years a telescope of 15 inches aperture was considered enormous in size. In 1867, Mr. Alvan Clark, of Cambridge Port, Mass., made one of 20 inches aperture. This at the time was the largest refracting telescope ever constructed. Since then, however, one of 24 inches aperture has been made in England; and not to be outdone, Mr. Clark is now engaged in constructing one of 25 inches, ordered for the Government observatory at Washington. Another of the same size has been ordered for the University of Virginia.

It is a rule in constructing telescopes to make the length to correspond in feet, to the number of inches in the diameter of the aperture,—hence the two which Mr. Clark is now building will be each 25 feet in length. Their cost will be about \$100,000 each, and although such an instrument weighs several tons, it is so nicely adjusted on being placed in position, that it can be moved with a finger.

Mr. Clark is the most successful telescope maker in the world, and yet he is self taught,—never having visited a manufactory. When advised by friends, in his early labors, to visit some establishment to learn the trade; he replied that he preferred to study it out. There is no doubt that the originality resulting from such "study," has been the cause of his wonderful success.

**ARTIFICIAL BUTTER.**—During the late siege of Paris many expedients were adopted to provide the necessities of life, and some of its luxuries. Among these the manufacture of artificial butter was quite successful, and one of the processes received the approbation of everybody, as being the best and most nearly like the real article. By that process the butter was obtained from the olive and margarine which are yielded by pressing animal, fatty substances, in the manufacture of stearine; the oily matter thus yielded having the same composition as butter. After being separated, it is subjected to a process which brings it to a consistency of butter, and is then bleached, after which the yellow coloring is added in the form of annatto or carrot juice.

**ENGRAVING BY ELECTRICITY.**—The efforts which have been made from time to time, with but poor encouragement, to engrave on metals by means of electricity, seem at last to have resulted in the attainment of practical results. An ingenious French mechanic has produced an invention by which a metal plate, upon which a design is drawn with a chemical ink of some kind, is slowly rotated with its face vertical, and several other similar plates, graded in size, are also slowly rotated by appropriate mechanism. The object of the invention is to engrave on the smaller plates the design traced upon the largest, on different scales of magnitude, which is accomplished by applying a cutting point to the face of each plate, and which is pressed against it by means of an electric current whenever a blunt point, applied to the large plate, encounters the ink in which the design is traced,—the cutting points being at other times withdrawn. The point presented to the first plate is merely a "feeler," which determines by electrical agency whether the ink is beneath it or not. If it is, the points are pressed into the surface of the other plates; if not, they are withdrawn and prevented from cutting. The feeler and the bruins must, of course, all follow a spiral track. This is crude, and can be made applicable to the reproduction of certain kinds of designs only, but it is considered a long step in the direction of practical success.

**MORE GIFTS TO SCIENCE.**—Mrs. Susan R. Higgin, a widow whose husband had acquired his fortune in the United States, has recently presented \$25,000 to the Sheffield scientific school, at New Haven, for the endowment of a professorship of Dynamic Engineering.

## THE PHILOSOPHY OF SLEEP WALKING.

A correspondent of the *Scientific American* gives the following theory to account for the habit of walking in the sleep:—"My observation has led me to believe that sleep walking is a habit of the system. I have noticed that children who are allowed to go to sleep on the floor or lounge, in the evening, and afterwards, at some regular hour, are aroused (of course only partially awakened), and sent to bed, will in time acquire the habit of sleep walking. I have no doubt that the man mentioned, who would get up and go to the cellar in the night for a drink of wine while asleep, had been in the habit of first going for it, in the night time, while awake. I presume but few have failed to notice how soon the mind, by dreams, will recognize a habit of waking at a particular hour for any purpose.

I think that the whole philosophy of sleep walking has its foundation in habit, acquired by disturbance at some regular hour devoted to sleep.

**NEW LIGHT FOR THE USE OF PHOTOGRAPHERS.**—Photographers have long been seeking for an artificial light, so readily available that the success of their manipulations may not be wholly dependent on the sun, and subject to the caprice of the clouds. The last attempt to find the much needed substitute is by digesting zinc in the iodide of ethyl, a process which yields a liquid substance inflammable by the mere contact of the oxygen in the air. By passing pure hydrogen (or perhaps ordinary illuminating gas,) through the fluid, the compound of zinc and ethyl will volatilize into the gas, and will yield, on combustion, a flame of extraordinary brilliancy and vivid whiteness of color.

It is said that the actinic effects of this light are inferior to those produced by the combustion of magnesium; but the steadiness of a flame from a gas jet will so far surpass any that can be obtained from a burning metal, even when the latter is of the highest purity, chemically obtained, that most photographers will doubtless give it the preference.

**PURIFICATION OF FATS.**—M. A. Boillet has devised a process for this purpose, which he has communicated to the French Academy. (*Comptes Rendus*, vol. 72, p. 36.) Suet, or fat of any kind, is beaten for three or four hours with lime water, the proportions being about half a gallon of lime-water to 2½ lbs. of fat; it is then allowed to cool. As soon as the fat is sufficiently set, it is transferred to a linen or flannel bag, and the water and oleic acid squeezed from it by gradually increasing pressure, in a hydraulic press, or otherwise. He states that fatty matters thus treated, lose all bad smell, and acquire remarkable whiteness and hardness, after standing a few days. If re-melted in water, acidulated with sulphuric acid, acetic acid, or vinegar, a fat is obtained which, he says, is "perfectly" purified, and can be applied to all the purposes for which the best fatty substances are employed.

**TO RENDER GUN COTTON SAFE.**—Dr. L. Bleekrode, while recently engaged in some experiments, wherein he tried to ignite gun-cotton by the electric spark, thought to facilitate the explosion by wetting it with an inflammable liquid, such as bisulphide of carbon. To his surprise he found that it was only the bisulphide that was set on fire; and that it burned away, leaving the gun cotton intact. He repeated the experiment with ether, benzene, and alcohol, igniting the several liquids with a flame. In each case the gun-cotton remained unconsumed. Dr. Bleekrode therefore suggests that gun-cotton might be safely kept under a layer of benzene; as, if the liquid happened to be ignited, no explosion would take place, and the gun-cotton would be quickly rendered fit for use by a brief exposure to air.

**IMPROVED LIQUID FOR GALVANIC BATTERY.**—Mr. Victor Barjon has devised a new battery liquid, formed by mixing a solution of bichromate of potash with a little lime, and with sulphuric acid. He puts two lbs. of bichromate of potash into a gallon of boiling water, and lets the solution cool down to 68°, and adds two ounces of lime. After stirring, he adds sulphuric acid until the gravity reaches 35° Beaumé. Then, having stirred the whole, he lets it stand for twenty-four hours, when it is ready for use.

**STAINS FROM ACIDS** can be removed by spirits of hartshorn diluted. If not removed by first application repeat the process. Afterwards rinse off with water.

CORRESPONDENCE.

SALT LAKE CITY, U. T.

BY OUR OWN TRAVELER.

EDS. PRESS:—I find many changes in Salt Lake City since my last visit. "Times" are lively, and business of all kinds, especially of those branches connected with mining interests, is flourishing. I see many familiar faces from Nevada and all parts of the Pacific Coast, most of them evidently attracted here by the fame of the wonderful mines, and on the look out for a revival of the days of "49". Many branches of industry are represented in the wooden ware factories, woolen and paper mills, steam wood working mill, etc. Education is receiving a great deal of attention both from Mormons and "Gentiles"—the Episcopalians and Methodists each having a seminary under their exclusive control. The Catholics, Methodists and Episcopal denominations are permanently established here now, and for the latter sect a fine \$40,000 Gothic edifice, is in process of construction.

There are four hotels, the Salt Lake, Townsend, White and Revere Houses, together with numerous restaurants and boarding houses. The Salt Lake House,—capable of accommodating some 200 boarders, is located on the principal business street of the city. The Salt Lake Tribune and Mining Gazette, by calling attention to the resources of the Territory, has materially assisted in the rapid development of the mines now attracting so much attention. Of the other two daily papers, the Deseret News and the Daily Herald, the latter is the official organ of the Mormon Church, and has been published for the last 16 years as a weekly. A type foundry is attached to the office of this paper.

The mineral producing qualities of the Territory are in no wise better proven than by the briskness in the business of crushing and sampling ores. Two new enterprises of this kind have lately been started, one of which is the

Salt Lake City Sampling Mills.

Messrs. Geo. J. Johnson & Co., the proprietors have a piece of land four blocks from the R. R. depot embracing an area of about 15,000 square feet. A 10-horse power engine is in use. They are fitted with a Forsman Iron Clad Stone mill, and one of Brodie's crushers, made by Hinkley & Co. of San Francisco. Ores are bought by these gentlemen that will average from \$80 per ton, and upwards. The dimensions of the building are 50x46 feet. In buying silver or gold ores the assays are all made by scortification.

I called on Mr. J. R. Nichols who is now experimenting with Kroms' process of concentration, at Mr. Jennings' old tannery. This gentleman informs me that he has ordered six of Kroms' concentrators from the East, which he expects shortly. These large sized machines will run through from 20 to 30 tons of rock in 24 hours, and they will cost from \$800, to \$1,000 each, delivered in Utah. They weigh 1,200 lbs., are 4 feet high, and require a space of 3x6 feet. I saw one of the small sample machines in operation. The ore in passing through is freed of a large proportion of gangue matter, materially lessening the heavy expense of transportation. By means of these machines, ores falling below \$50 per ton can be concentrated and shipped at a profit. I was shown plans of the buildings soon to be erected for the purpose of carrying on this enterprise. At the works of

H. S. Jacobs,

Is a 16-horse power stationary engine, Starkey's patent, which only occupies a space of 3x6 feet, and gives motion to a Dodge crusher and a re-grinding machine. The building is 86x30 feet, and fitted up with many conveniences for facilitating labor.

Seven Furnaces

Are now running successfully in the Territory and many new ores are in course of construction. It is estimated that there are now upwards of 10,000 persons engaged in mining enterprises, about one-half of them being prospectors. I see hundreds of miners from Colorado, Nevada, California, and all parts of the Pacific coast, which speaks well for the prospects of the country. Mills and furnaces in San Francisco, Chicago, Omaha and Newark, are

supplied with ore from here. Large quantities are shipped to Swansea, England, the freight being only \$7 per ton from N. Y., and returns are given in 60 days.

Reid's large building, on Main street, is the head-quarters of mining operators and many well known men have their offices here,—including Messrs. Gould, of S. F.; S. W. Howland & Co., crushers and samplers; C. L. Stevenson C. & M. engineer, and Woodhull Bros.

In the windows are displayed fine collections of Utah ores, and the place presents a lively appearance between the hours of 10 and 4, reminding a San Franciscan forcibly of California street. The town is filled with transient visitors, who desire to see the "City of the Saints" and its numerous adjacent, and already famous mines. The people of Utah are now constructing a railroad to run south through the Territory which will be some 75 miles long. They intend running branch lines to the foot of the cañons, in order to convey ore to Salt Lake City for shipment, and bring coal from the lower part of the Territory for the use of the smelting and reduction works. This road will be controlled by the Mormons, which shows that, at least, they desire to give encouragement to mining and railroading. There is a line of 6-horse Concord coaches running between Salt Lake City and Lake Point, connecting with the steamer "City of Corinne," by which tourists are enabled to see the wonders of the scenery of this "Dead Sea of America." The time occupied in the run across, in both lake and river is only eight hours.

The Utah Central R. R. received for the week ending July 23d, 2,464,064 lbs. of freight, and shipped 1,605,419 lbs. Of this shipment 1,206,000 lbs. was bullion. Messrs. N. P. Woods & Co., forwarding and commission merchants, informed me that they shipped East and West, between May 15th and July 26th, 12,269 sacks of ore, weighing 1,153,867 lbs. and 10,970 hars weighing 1,223,300 lbs.

S. W. Howland & Co.,

Crushers, samplers and purchasers of ore, say that they shipped during the months, April, May and June, from their mills,

8 car loads of	20,000 lbs. each	silver ore
27 " "	20,000 " "	bullion "
21 " "	20,000 " "	copper "

Part of the silver and bullion went East and all of the copper came to San Francisco.

I learn from the Tribune that the mines and furnace belonging to Messrs. Bateman & Buell in Bingham Cañon, having been reported on favorably by Captain Nancarrow and Mr. Henry Sewell, has been sold. The property was transferred to Capt. Nancarrow as representative of an English Company called the Utah Mining Co. The amount paid for this property was \$450,000 coin. It is a large and important transaction for Utah, and shows that the attention of English capitalists has been successfully called to the mines. W. H. M.

Discovery of Placer Diggings in the State of Durango.

Dr. T. M. Rapp, an American resident of Santiago Papasquieira, has struck good diggings in a gulch near Escohar. Dr. R. is an old Californian, went to Frazer River, Kern River, Salmon River, Confederate Gulch, Reese River, White Pine, and numerous other stampedes, and finally settled down as a physician in this charming valley of Santiago,—as a physician with a practice worth \$5,000 to \$10,000 per year.

The old hankering, however, returned this summer; and, so shouldering his pick, shovel and pan, off he started for a prospect. The details (authentic) are not yet at hand, but a stampede is. I saw the result of three pans—in fact, assayed one. It was fine shot gold, and was worth \$3.26, 855 fine. As matters come to light I will report them.

Remarkable Yield of Silver.

At Utopia a body of ore was struck in the mine; \$500,000 was taken out in 22 days, with 10 men only. The ore is Pyrargyrite (Dark Ruby), and weighed 27 tons [?]. The deep crimson color was superb. The owner who had worked it for years with discouraging results, sold it only three days before for \$3,000 cash, to one Carrasco, a merchant of Cosala.

The quicksilver mine at Canelas has one furnace completed, and produces 16 flasks per day. Bodies of cinnabar are struck very repeatedly, and a larger furnace is to be erected immediately, under the direction of an American formerly of New Almaden, Cal. Very truly yours,

VALVERDE.

THE HORSEMAN.

ORIGIN AND HISTORY OF THE PERCHERON NORMAN HORSE.

EDITORS PRESS.—Believing that the knowledge of this valuable race of horses, and still more of its existence in the United States, is confined to a small number of persons, I have thought it would be not uninteresting to your agricultural readers to give a brief account of the animal.

Le Percho, from which the animal derives its name, is a district in that portion of France which was formerly known as Normandy, and in which the breed of the Norman horses has been most highly cultivated, and where it exists in its most perfect form and most improved condition. By some means, somewhat anomalous and at variance with the general experience and principles of breeding, this breed, which must in its origin have been a cross, has in the process of many ages become a family, perfect in itself, capable of transmitting its qualities and reproducing itself, like to like, without any loss of energy or characteristics by breeding together mares and stallions of the same race.

The remarkable purity of the race, says Herbert, is attested by the certainty with which the stallions transmit to their progeny, begotten on mares of a different race, their own characteristics, and the high degree in which the offspring of the mare, bred to horses of superior class, retain the better qualities of their dams. For it appears to be a certain rule in breeding, that the purer the blood, and the higher the vital energy and vigor of either parent, in the greater degree does that parent transmit its properties to the young; although the certain transmissions of the larger portions of those energies is always on the stallions side, and it is only in the longer retention of an inferior proportion of her qualities by the progeny, that the better blood of the dam can be traced when bred to an inferior sire. When bred to a purer blooded stallion than herself, the more pure blood the mare herself has, the more strongly will her own marks descend to her progeny, and the less will they be altered or modified by those of the sire.

Now, the Percheron Normans are clearly a pure race *per se*; we do not mean by the words, a thorough-bred race, but a race capable of producing and reproducing themselves *ad infinitum*, unaltered, and without deterioration of qualities, by breeding like sires to like dams, without infusion of any other blood, just as is done by Durham, Ayrshire, or Alderney cattle, by setters, pointers, greyhounds, and, in a word, by any and all animals of distinct and perfect varieties of the same species.

The only remarkable thing in this case is, that such should be the fact, under the circumstances of the Percheron Normans being originally—as they are beyond a doubt—the product of a cross, although a most remote cross in point of time.

The original Norman horse, now nearly extinct, which was the war-horse of the iron-clad chivalry of the earliest ages of William the Conqueror, and Richard Cœur de Lion, is thus accurately described by the importer of the Percherons into New Jersey, Mr. Edward Harris. They average, he says, (and we are personally cognizant of his accuracy), full sixteen hands in height, with head short and thick; wide between the eyes; jaws heavy; ears short and pointed, well forward; neck very short and thick; mane heavy; shoulders well inclined backward; back extremely short; rump steep; quarters very broad; chest wide and deep; tendons large; muscles excessively developed; legs short, particularly from the knee and hock to the fetlock, and thence to the coronet. It was soon found, even while complete armor was in use, that these enormous, bony Normans, which are still, though deteriorated, the ordinary, heavy draught horses of France, had not sufficient speed to render the cavalry charge effective, or sufficient blood to give spirit adequate to the endurance of long-continued toil.

At the same time the Andalusian horse, which in its highest form, was a pure barb of Morocco, imported into Spain by the Saracen Moors under Tarik, who has left

his name to the rock of Gibraltar, and in its secondary form, a half-bred horse, between the African barbs and the old Spanish horse, which had long before received a large tincture of oriental blood from the Numidian chargers of the Carthaginians, who so long occupied that country, proved, in its unmixed state, too light for the enormous weight of a caparisoned man-at-arms, or, if occasionally equal to that, too costly to be within the means of any but crowned heads.

The bone and muscle, and much of the form of the Percheron, come from the horse first described—the old Norman war-horse; and while he gets his spirit action from the Andalusian, docility comes from both sides.

On the expulsion of the Spaniards from the Northern Provinces, the supply of Arabian stallions was cut off, and, since that time, in the Perche district of Normandy, their progress has doubtless been bred in and in; hence the remarkable uniformity of the breed, and the disposition to impart their form to their progeny.

A. WILSEY.

Horse Work.

At a meeting of the British Association at Dublin, Mr. Charles Bianconi, of Caspol, read a paper relative to his extensive car establishment, after which a gentleman stating that at Pickford's, the great English carrier's they could not work a horse more than ten miles a day, wished to hear Mr. Bianconi's opinion on the subject. Mr. B. stated he found by experience he could better work horses eight miles a day for six days in the week, than six miles for seven days. By not working on Sunday, he effected a saving of 12 per cent. Mr. Bianconi's opinion on this point is of the highest importance, for he has over 900 horses working sixty-seven conveyances, which daily travel 4,244 miles. It is the result of forty-three years' experience.

HOW TO BREAK COLTS TO LEAD.—The Western Rural gives the following hints for breaking colts to lead. "Take a piece of common rope, six or eight feet long; make a noose on one end large enough to slip easily into the colt's mouth. Then take the other end and pass it over his neck, through the noose on the under side of the mouth, and you are ready to begin operations. Step around to one side of the animal, a few feet away, and command him to move; at the same time give a sudden pull on the halter. Continue in this manner, giving a sudden pull sideways, but never forward, every time the colt refuses to move, and gently pat him on the neck when he obeys. By this method a colt may generally be broken to lead in a couple of hours; after this any kind of halter can be used. A colt broken in this manner will not learn to pull back on the halter, as many do, when the method of pulling forward on the halter and beating to make them lead, is resorted to, as is often the case."

HOW TO DRIVE A YOUNG HORSE.—We find the following floating, and do not know its paternity, but it is good advice: "In teaching a young horse to drive well, do not hurry to see how fast he will trot. Keep each pace clear and distinct from the other; that is, in walking make him walk, and do not allow him to trot. While trotting be equally careful that he keeps steady at his pace, and do not allow him to slack into a walk. The reins, while driving, should be kept snug; and when pushed to the top of his speed, keep him well in hand that he may learn to bear well upon the bit, so that when going at a high rate of speed he can be held at his pace; but do not allow him to pull too hard, for it is not only unpleasant, but it makes it often difficult to manage him."

SADDLE OR HARNESS GALLS.—These are bruises caused by friction and moisture, occurring most frequently in warm weather; the parts are rubbed raw, and sometimes bleed. The treatment is simple and effectual. Bathe the parts several times a day with one pint of water and half a pint of tincture of myrrh.

WHAT A HORSE EATS.—A horse weighing from 1,000 to 1,200 pounds will eat about 6 tons of hay in a year, and 3½ tons of corn stalks or oat straw, and 2½ tons of corn or oats, would be about equivalent for the amount of hay.

OLD HORSES.—Aspen of horses forty-two years old still in splendid condition; are daily seen in the streets of Watertown, N. Y.

# MINING SUMMARY.

THE following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**GLOBE.**—Montana *Miner*, Aug. 26th: In the shaft 18 ft. down, this mine is developing a body of ore, which carries \$70 in silver to the ton, and the copper in every ton is worth \$50 on the dump. They have four veins, and the quantity which may be mined is fast increasing.

**TARSHISH.**—While absent yesterday Prof. Rickard, left a fine specimen of ore, which we should judge would assay \$250 per ton, with the following notes: "Tarshish—150 ft. level—large deposit—hard equal to soft."

The mill of the M. & N. W. Co. is now nearly completed. Crushing for brightening the pans and getting all in order, will commence next week.

The start for a new mill at the foot of Main st. is encouraging. The building is to be, of similar size and shape to that nearly completed for the M. & N. W. Co.

### BUTTE COUNTY.

**IN THE RIVER.**—Oroville *Record*, Sept. 2d: There are one or two extensive flumes on the North Fork, and other branches of the Feather. Nisson & Co. have a wing dam in the main Feather near the old Cape claims, at the mouth of Morris' Ravine, which they are now successfully working.

### CALAVERAS COUNTY.

**RICH ROCK.**—Calaveras *Chronicle*, Sept. 2d: An ounce of quartz taken from the Polomo mine yielded \$2. This is at the rate of over \$6,000 per ton.

**COMMENCED CRUSHING.**—The mill leased by the proprietors of the old Foot & Thompson quartz mine, near Rich Gulch Flat, is in operation crushing rock taken from the lead.

**PETTCOAT.**—Work has been resumed upon the Petticoat mine, at Railroad Flat. Parties in Virginia City have furnished means to sink the main shaft 300 ft. deeper, which will thoroughly prospect the lead.

**GOOD YIELD.**—A recent clean up at the Whisky Slide mine, netted 106 ozs. of retorted gold, the product of 125 tons of rock.

**ENORMOUSLY RICH GRAVEL.**—Bates & Co., whose claim is located about a mile from town, in Chili Gulch, have recently struck the lead and found it rich beyond all comparison. They took out 4½ lbs. of gold in as many days, the product of 4 men's labor.

### EL DORADO COUNTY.

**MINE SOLD.**—The Placerville *Republican* says that an English company have purchased the "Pacific" quartz mine.

### INYO COUNTY.

**RUNNING.**—Inyo *Independent* Aug. 26th: The three furnaces reducing the Cerro Gordo ores are in full blast.

### LOS ANGELES COUNTY.

**BULLION.**—Los Angeles *News*, Sept. 2d: 200 hundred bars of bullion from the Union works arrived at the Depot yesterday. Aggregate weight 16,511 lbs.

**TIGER ORE.**—Between 5 and 6 tons of this ore assayed, gave as high as \$1,028 per ton.

**LOS ANGELES**, Sept. 1st—by telegraph.—The Los Angeles Foundry is at work on a 20 stamp quartz mill for the Piute Mining Co. at, or near Sageland.

### MARIPOSA COUNTY.

**FERGUSON MINE.**—Mariposa *Gazette*, Sept. 1st: This mine on Main river purchased two months ago by an English Co., for \$100,000 cash, looks as promising as ever.

**MILL STOPPED.**—J. Hite's quartz mill at Hite's Covo was compelled to stop last week on account of the scarcity of water.

**AELEKEMA & HART** struck a rich pocket last week in their mine at Sebastopol.

### NEVADA COUNTY.

**LOCATION.**—Nevada *Gazette*, Sept. 1st: M. McDonough and others have located 20 claims of 100 feet each, on Randolph Hill, Grass Valley Township, for mining purposes.

**ATTEMPT TO ROB SLICES.**—Nevada *Transcript*, Sept. 5th: On Thursday night an unsuccessful attempt was made to rob the slices of the Union Mining Co. at Relief Hill.

### PLACER COUNTY.

**JUNCTION DIVIDE M. C.**—Auburn *Herald*, Sept. 20th: This Co. have opened a quartz ledge 5 ft. thick, on a bench on the west bank of the North Fork of the American river, and about 300 ft. above the bed of the stream. The quartz looks well and it

has every indication of being a rich mine. **RATTLE SNAKE ITEMS.**—Miners are all busy, except the Kehoe Co., who talk of putting a flume in.

### PLUMAS COUNTY.

**GOOD YIELD.**—Quincy *National*, Sept. 2d: The Eureka mine, since the mills were started the present Summer, has yielded the sum of \$105,000.

### SOLANO COUNTY.

**THE QUICKSILVER MINES.**—Vallejo *Chronicle*, Sept. 2d: It is expected that the smelting works will be completed next week, and the smelting of ore at once commenced.

### TULARE COUNTY.

**DITCH ENTERPRISE.**—Visalia *Delta*, Aug. 31st: The old Spangler Ditch, running out of Kings river, has been purchased by the people of the Lone Tree settlement, for the sum of \$3,000 in paid up stocks, and a company with a capital stock of \$10,000, are about to enlarge the ditch to a width of 22 ft.

### TUOLUMNE COUNTY.

**KINCAID FLAT TUNNEL.**—Sonora *Democrat*, Sept. 2d: Work is being pursued day and night by a force of 6 men who have made from 9 to 10 ft. each week for sometime past. This Co. have made an open cut of 250 ft. driving their tunnel through solid rock 1,300 ft. at an expense of about \$60,000. They have 420 ft. more to run to reach the sink of Kincaid Flat, which will require another year.

## Nevada.

### COPE DISTRICT.

**MINERAL HILL.**—Elko *Independent*, Sept. 2d: The grade of the new mill is nearly completed, and the other one will start up in a short time; and will surpass its usual yield of \$120,000 to \$130,000 per month. The Austin Co. is making every effort to construct a mill to crush the ore which is now on the dump and being daily taken from the mine.

### EUREKA DISTRICT.

**BIG STRIKE.**—Eureka *Sentinel*, Aug. 31st, P. H. B. Smith has uncovered a body of ore in the Otho sufficient to astonish any man who has ever been through the mine. From what was a good mine, worth \$20,000 to \$30,000, it has taken rank as a first class one.

**STRIKE IN THE CHAMPION.**—Yesterday morning there was uncovered at the lowest point in the incline, a body of yellow and black carbonate ore, which assays as highly as any strike discovered. The ore body from the surface seemed to have divided at a depth of 75 feet, the upper stratum ran towards the old Champion, and, being convinced that there was a second stratum below, the supt. ordered that a shaft be sunk. Two days have developed a second wide and rich body of ore.

**STARTER.**—The new Phenix furnace has been started up.

\$125,000 in Gold coin arrived yesterday to make the first payment on a mine.

**THE LARGEST BAR.**—The Richmond Co. shipped yesterday one bar of bullion weighing 1,813 lbs.

**ACTIVITY.**—For the last few days unusual activity among mining speculations is noticeable, and quite a number of small sales have been effected.

**FISH CREEK DIST.**—Water has been discovered near the mines at a depth of 25 ft.; 200 men employed.

**DIAMOND DIST.**—The vein on the Mammoth is 6 ft. in width and can be traced for a long distance. About 100 tons of good ores are on the dumps.

### ELY DISTRICT.

**BULLION SHIPPED.**—Ely *Record*, Aug. 31st: W. F. & Co. shipped since our last issue, bullion valued at \$36,299.37, and for 4 days ending Aug. 27th, \$52,618.17.

**HIGHLAND DIST.**—H. Mathey has an incline down 100 ft. in his mine, ore of a high grade is being taken out. The "Seven-Thirty" claim shows a body of ore of extraordinary richness, assaying from \$150 to \$750 per ton. The pay ore is about 4 ft. in width. The Sovereign claim near the Seven-Thirty, shows a ledge about 8 ft. in width and assays from \$70 to \$300 per ton. On the same hill is the Dana claim, equal to the Sovereign in size and richness. The Othello, is 5 ft. in width, assaying from \$60 to \$395 per ton. The Silurian claim is 4 ft. in width, pulp assay showing \$173 per ton. The Hamburg ledge is down 20 ft. with 14 tons of rich ore on the dump. Arizona claim, one of the largest ledges in the Dist. has 100 tons of high grade ore on the dump. The Lyell, shows a ledge 5 ft. in width, all mineral.

**MAIN STREET GOLD MINES.**—Work on these mines continues briskly. The ledge increases in width as depth is attained, and the prospects continue flattering; assays made from time to time show an increase

in silver but still a preponderance in favor of the gold. The ground in the vicinity has all been located and recorded.

### HUMBOLDT.

**BULLION SHIPMENT.**—Unionville *Silver State*, Sept. 2d: The Arizona mine shipped through W. F. & Co., since our last issue, \$6,639.

**THE BLUE LEDGE** in Golconda Dist. near the old Cooley ranch, is to be sold for \$20,000. The mine has a well defined ledge, averaging 2 ft. in thickness, of excellent ore.

**SEMINOLE Co.**—Some little time since they struck a vein composed principally of decomposed quartz about 4 ft. wide; they have continued to follow this vein with good progress. No great change occurred until within a few days, but now they have a much better defined strata of quartz, from top to bottom of drift, lying close to the north-east wall, while the country rock seems more settled.

**MINE SOLD.**—Winnemucca *Register*, Sept. 2d: M. S. Thompson and others, of Mill City, have made a sale of a mine situated about 40 miles north-east of Wadsworth, near the head of Long Lake. We have not learned the amount paid, but know it was a cash sale. The ledge is said to crop 2,500 ft. with a uniform width of 15 ft.

### WASHOE.

**BULLION.**—Gold Hill *News*, Sept. 1st: The Bank of Cal. at Virginia, yesterday shipped \$15,000, principally from Crown Point and (same paper Sept. 3d.) \$44,000 in silver bars from the Yellow Jacket and Chollar-Potosi mines.

The Bank of Cal. yesterday shipped \$22,600 in silver bars, principally from Crown Point and Yellow Jacket.

Hale and Norcross M. C. have received a new and powerful engine, soon to be set up at their works.

**CHOLLAR-POTOSI** folks are taking out 100 tons per day, assaying \$40 per ton. Considerable prospecting is going on. The Sutro tunnel was in yesterday 2,378 ft. The ore breasts on the 200-ft. level of the Crown Point are improving. The Uncle Sam mine is to be pumped out to furnish water to the mills along Gold Cañon. The pumping machinery is being put in order. Within the past few weeks promising discoveries have been made 4 or 5 miles south of us, in Devils' Gate Dist.

**CALEDONIA MINE.**—The body of ore on the 400-ft. level is looking exceedingly well. The ore is high grade, running from \$60 to \$80 per ton.

**BELCHER.**—The ore body at the 100-ft. level proves to be extensive and rich.

**YELLOW JACKET.**—The cross cut east at the 1,100-ft. level is in good ore, showing the new streak to be 20-ft. wide.

**DANEY.**—The main shaft is down 350 ft. and good progress is made in the south drift.

### WHITE PINE.

**BULLION FORWARDED.**—*News*, Aug. 26th: W. F. & Co. shipped to N. Y. from the Treasure Hill M. & M. Co., 4 bars bullion, 452 lbs., value \$5,874.17.

Same paper Sept. 23: The bullion yield for the week, with a number of stamps idle, will foot up \$55,850.48. For the month ending 31st ult., the shipments were \$183,119.11.

**MUKWONAGO.**—There are 3 shafts upon the mine from 30 to 125 feet in depth, in 2 of which good ore appears with every indication of striking it.

**GREAT WESTERN.**—Working lower and upper shaft day and night.

**EAST SHEBOYGAN.**—Working six men. Breasting ore from tunnel and raising ore from shaft, also driving a tunnel further north to tap the vein at that point. About 40 tons of ore on the dumps. A blacksmith shop has been erected. A large force will be put on, and work pushed ahead day and night. The ore breast is now at least 30 feet wide.

**NORTH AURORA.**—Good headway is made sinking the new shaft. The Lady's Chamber is 37 ft. long, 31 wide and 32 high. A mass of high grade ore is in sight in the bottom of the chamber; in fact, it extends all over it. Extracting about 24 tons every 24 hours.

**WARD BEECHER.**—The whip shaft is down 50 ft., and looking well. The two shafts (in the Ward Beecher and North Aurora) are down about 44 feet each.

**SOUTHERN CROSS.**—This mine, situated in Mahogany Cañon, is showing a large body of good ore. Work will be resumed the coming week with two shifts.

**GENERAL LEE.**—The north-east drift, 100 ft. in. is following a spar seam, disclosing a large body of ore. Working 6 men.

C. T. FAX.—The main tunnel is 200 ft.,

and shaft from main tunnel down 100 ft. Lower levels from the bottom of the shaft extend 150 ft., from which a good quantity of high-grade ore is taken out. About 250 tons of ore on the dumps.

**SOUTH AURORA.**—A new tunnel was started this week to tap the main body of ore 60 ft. deeper than former workings.

**GENESEE.**—Has a fair sized vein of ore, some of it of very high grade. Work is carried on with a small force of men at present.

**SILVER WAVE.**—A true vein has been found pitching East, with a well-defined foot wall going down. Working 8 men.

**MAMMOTH.**—Large amount of low-grade ore in sight.

**PORTAGE.**—Working two shifts. Shaft down 70 feet and ore improving.

**BEECHER CONSOLIDATED.**—Shipping ore constantly to Manhattan mill.

**VIRGINIA.**—Work will be resumed on this mine in a few days.

**FEATHERSTONE.**—Have not visited this mine yet, but understand it is looking well.

**SILVER WEDGE.**—Shows a marked improvement in quantity and quality of ore during the week.

**BASE MINES OF TREASURE HILL.**—It is known that negotiations are pending for the sale of the Elko, Imperial and Monitor mines.

**BASE METAL—MONTE CRISTO.**—The Trench, Bald Eagle, Badger State, and Philadelphia, are bonded for 90 days, to an English Co.

**TRENCH.**—A fine quality of ore is now being hauled from this mine to the mill.

**OPHR.**—A rich vein of ore from 6 to 10 inches wide was developed this week, the ore assaying well up in the hundreds.

**MERRILL & LEATHERS.**—The company will commence hauling ore from this mine and the Crown Point this week, for reduction at the mill.

**OUTSIDE DIST.**—TEM PIUTE.—The Kinsey shaft will be put down 100 ft.

The Cliff, York and other mines, are looking well.

**ROBINSON DIST.**—On the Osborne mine work is progressing rapidly with good prospects. Finding copper-silver-bearing ore of the highest order.

**PIERMONT.**—The mill is running 10 stamps. A rich body of ore has been found in the South Extension.

There are several promising mines 16 miles east of Piermont.

**WHITE CLOUD.**—This ledge is 12 ft. by measurement. Assayed rock from the top croppings of the Silver Wave, yielding \$518.13 to the ton. Five feet from the surface, rock was obtained that went \$910 to the ton.

**EUREKA.**—There is good authority for saying that nearly all the mines in this dist. in operation, are proving rich beyond the most sanguine expectations of the owners.

**SCHELL CREEK MINES.**—The discovery of rich rock near the Schell Creek station on the Overland road, has caused quite a stir. Several batches of rock have been worked at the Smoky mill, one batch going \$395.78. For a 15 or 20 miles rich rock is found on the surface. The mill at Egan is about to start up on the ore.

## Arizona.

**PRESCOTT Miner**, Aug. 27th: A new silver lode christened the Mineral Creek, was found about 3 miles from Prescott. New and rich ledges have also been discovered in Pino Grove, Turkey Creek Dist. the past two weeks.

## British Columbia.

We clip the following mining items from late exchanges:

A party of miners from Montana, with 60 pack animals, arrived at Victoria on their way to Omineca, and report hundreds on the trail behind them. Reports from Kootenay are generally favorable. It is believed a large extent of fresh mining ground will be opened this year. Good news is had from the Big Bend mining district—the miners making from small wages, to \$30 per day.

## Colorado.

**BOULDER Co.**—Cor. Central *Register*, Aug. 23d: A party left here this week to prospect on St. Vain.

"Richmond" lode carries ore 2 feet in width; worth an average of 160 oz. silver to the ton. "Grand Island" carries ore 15 inches in thickness, the best of which assays 600 oz. silver, per ton, and the average 125 oz. A lot of fine-looking ore lay on the dump. "Grand View" at a depth of 26 feet shows first class silver ore 15 inches in thickness, average value \$500 to \$1,000 per ton.

**CLEAR CREEK CO.**—Johnson & Nichols shipped on Monday a silver brick weighing 1,352 60-100 oz 952 fine; \$1,665-92 coin value. This Capital lode, near Downieville, is attracting attention. An assay made of a choice piece is said to yield 600 oz. per ton in silver. In the 10 ft. last drifted the ore vein of the Wineapolis has changed from 4 to 8 inches. An assay gave 1,055 oz. per ton. It is worked by an adit, in 30 ft. The Equator lode is again producing fine ore. The O. K. lode is in good pay in places. The Stewart Reducing Co. have shipped in the last few days one brick weighing 1,137 ozs., 750 fine, coin value \$1,102.50; another 1,190 ozs., 784 fine, \$1,206.30, and another 1,029 ozs., 788 fine, \$1,038.34, all coin value. Palmer and Nichols shipped one brick of silver weighing 1,406 ozs., 867 fine, \$1,700.96 coin value. These shipments are of almost daily occurrence. The Comet lode is being worked again by Smith & Gravois, who recently assorted a dump and took out about three tons of ore that yielded between \$200 and \$300 per ton.

**SUMMIT CO.**—Cor. same: Greenleaf & Co. are about to construct a ditch from the three branches of the Swan to the divide between French and Humboldt gulches. It will be 13 miles long, will be flumed the entire length, and of sufficient capacity to carry all the water that can be obtained, which will be 1,000 inches or more. Tubbs & Morrow have leased the Gold Hill, below Breckinridge.

**TARRYALL.**—Hawthurst & Footo, work 4 mon, averaging \$7.50 per day to the man; Westall & Barnard work men, averaging \$6 a day to the man. Sargeant & Hubbard work 2 men, and are in \$10 diggings, Judge Hubbard has had several flumes running until recently. He has been digging ditches and constructing a reservoir, averaging good pay. Taylor & Rodus employ 3 men and are doing well. Below Hamilton on the creek, 4 men are working, and making \$4 a day, each. Near the head, several companies are developing ground, from which they obtain good prospects.

**Central Herald, Aug. 30th:** The Lexington, Gilpin County, Whitcomb's Clayton, and Potter's two mills, are running steadily. Hardesty's will be at work as soon as repaired.

Gilman & Russell, below the Rocky Mt. mill, have replaced their sluice boxes, washed away by the flood, with new ones. They clean up on Wednesday, after shovelling in 3 tons of ore, gave 4 1/2 of amalgam.

Tasher has been putting in a rocker at his mill in Eureka gulch. This and Waterman's are run without intermission.

Watford & Co. are working steadily in the gulch below Hill's. They have sunk a shaft 100 ft. to connect with their drift.

**Caribou Post, Aug. 16th:** Dr. Hopkins is driving down on the Mammoth, a strong, well defined, true fissure vein—hard, smooth walls, inclosing 4 ft. of ore at the depth of 30 ft. Deposits of black sulphurets are appearing. 100 ft. to the south Mr. Kenze is at work on the Boulder Co., and has a large amount of ore on dump. A Morgan has 150 ft. on the west end of the same location, and at 50 ft. depth has paying ore.

"The Constitution" is a rich gold lode, 200 ft. north of the Trojan, near Cardinal. The ore assays \$100 per ton.

**Georgetown Miner, Aug. 24th:** Mr. Snider has his company's crushing mill in operation. Work will be resumed on the Ferry lode, Republican Mt. shortly. Work has been resumed on the Briggs, Republican Mt. The Washington lode, Leavenworth Mt., is being worked. Work will soon be commenced both on the Griffith and the Henry Ward Beecher lodes. The Cliff mine, Democrat Mt., is yielding considerable first-class ore. The Terrible is producing a large amount of second-class ore, and considerable first-class. The lode in the Baltimore tunnel worked on a lease, is very productive. Myros has a lot of good-looking ore in mill, from a new discovery in Argentine Dist. The Ashley Franklin lode, Griffith Mt. is being worked, and encouraging results obtained. The Burleigh Tunnel is in 1,150 ft.

**CARBON MINE.**—Central Register, Aug. 30th: It is now 195 ft. deep, having got the 190 ft. level each way started, work has been resumed in the bottom. Here the width of first-class ore is now forty-two inches, and in the drifts driven about 20 ft. each way, the ledge is still wider. In the west shaft down about 100 ft. there is a fine body of rich ore in sight, each shaft 112 ft. deep.

**Idaho.**

**WARREN.**—Cor. Lewiston, Aug. 19th: The Hio Jacet will soon again be crushing rock. The miners on the Rescue ledge

have struck a larger vein and better quartz than has ever been found in that mine. Placer mines are doing well. Gibbs & Co. sold their claims on Meadow Creek for \$8,000, to Chinamen, and are going to open a new set 1 1/2 miles below on the same stream. Chnrch & Co. have good pay in their Meadow claims. John Keep is taking out some fine nuggets of gold from Hnston Creek, varying in size from \$1 to 5 ozs. A party of men are going out in a few days to prospect that stream thoroughly; also some other creeks in that vicinity yet unprospected.

**BOISE CO.**—Boise Statesman, Aug. 26th: The Gold Hill Co. have 25 stamps running. The tailings from the mill assay \$40 per ton.

**BULLION SHIPMENT.**—Silver City Avalanche, Aug. 26th: W. F. & Co. shipped from here, during the week ending yesterday, 10 bars of bullion, valued at \$20,638.89. The shipments for the month of August will foot up about \$100,000.

**FLINT DIST.**—C. S. Miller is working over the tailings of the ore that he crushed in the Rising Star mill last spring. The Twilight Co. continue operations.

**THE MINES.**—Work has been commenced on the Minnesota. A whim has been erected on the north shaft (130 ft. deep) and the water is being hoisted therefrom.

There are between 30 and 40 men at work in the Oro Fino, which is yielding a good quality of ore. Only about 35 miners are now employed in the Chariot. The South Chariot shaft is down 350 ft. The Mahogany continues to yield rich ore. Wright & Babcock have a shaft down 10 ft. on the north extension of the Idlewild. The vein is about 10 inches wide and shows rich in both silver and gold. The Empire shaft is now down 100 ft., at the bottom of which the ledge is 3 ft. wide. The shaft of the Little Grant is down 25 ft., showing the vein to be from 8 to 17 inches in width—rich in gold.

**Montana.**

**SALE.**—S. Givens has purchased Dr. Young's interest—one-third—in a mining claim on Glasgow's Bar, near Pioneer City. The price paid was \$6,000.

**WEST SIDE.**—Prospecting is going on at the head of Willow creek, northwest of Emmetsburg, with some indications that diggings may be found.

Powers, Miller, Guinn & Co. are putting in a "Bed-rock flume" near the town of Lincoln, 9 miles from the mouth of Cedar creek. The flume will be one mile in length.

**SUN RISE GULCH** is said to be almost worked out, having only 22 miners engaged in it at present.

**New Mexico.**

**CUNNINGHAM GULCH.**—Cor. Santa Fé Post, Aug. 26th says: French and Johnson cleaned up their arastra yesterday with satisfactory results. From two tons of what they call their good ore, they realized \$850.50.

Several silver lodes have recently been discovered which look promising, producing a very fine grained galena ore.

**Oregon.**

**BOHEMIA.**—Jacksonville Sentinel, Aug. 26th: The Bohemia party have returned; Mr. Small says that ere long hundreds and thousands of men will be there, working one of the richest quartz mines on this coast.

**Utah.**

**BULLION SHIPMENT.**—Salt Lake Tribune Aug. 29th: W. F. & Co. forwarded yesterday to N. Y. 9 bars of bullion from the Meadow Valley Wks., Pioche, Nev.

Same Aug. 30th: Woods & Co. shipped yesterday, one car load of bullion to Omaha, one to N. Y., and two to S. F.

W. F. & Co. ship, this morning, to N. Y., of Pioche bullion, (fine,) 14 bars, worth \$18,002.10.

**SUNBEAM.**—Col. Kinzer leaves to-day to consummate a sale of 1,600 feet on this celebrated mine.

**THE EUREKA MILLING CO.'s** mill is to be in operation within 70 days.

**GOLD.**—There has been considerable excitement in Little Cottonwood in consequence of the discovery of a gold-bearing quartz vein in the mountains a few miles from Central City. The rock appears to be quite rich, but as to the extent of the vein and the exact locality we are unable to give any information.

**TUNNEL SALE.**—Salt Lake Review Aug. 29th: A sale was perfected yesterday where in Eastern parties purchased \$2,000 worth of the North Star Tunnel Co., of East Canyon, paying down the cash.

**Mining Stock Market.**

THURSDAY EVE., Sept. 7, 1871.

Despite the attention given to politics during the past week, a very fair amount of business was transacted in the Board, several "corners" having had the effect of bringing out more stock than would otherwise have been the case. This was particularly noticeable in Yellow Jacket, which during the previous week sold to the extent of 12,500 shares, the extreme price being \$75 per share, and showing an average valuation of about \$70 per share, and a total of \$875,000, against 8,630 shares the present week, the price dropping to \$52 50 per share, but rallying again to \$59, and the aggregate sales amounting to about \$517,800. As a natural consequence, these sharp manipulations have brought ruin upon parties who were prominent and heavy dealers, carrying with them a train of suffering "dabblers," who now curse the day they ventured upon so apparently hopeful a speculation. Prices, generally, continue to be well maintained, and in a few instances a marked advance is observable. Outside stocks are in large demand at advancing figures.

The sales in the San Francisco Stock Board, from August 31st to September 6th, inclusive, have been as follows:

15 shares Amador at \$200 250.  
577 shares Belcher at \$17 1/2 @ 11 25.  
255 shares Buckeye at \$1 7 1/2 @ 50.  
1725 shares Consolidated Virginia at \$11 @ 25.  
4946 shares Chollar-Potosi at \$3 20 @ 31 75.  
7 115 shares Crown Point at \$30 @ 20 b 60.  
2630 shares Caledonia at \$16 @ 15 @ 18.  
2685 shares Eureka at \$15 7 1/2 @ 20.  
3005 shares Eureka Consolidated at \$15 7 1/2 @ 16 25.  
624 shares Gold & Curry at \$10 @ 21 16.  
1300 shares Golden Chariot at \$23 @ 29 21.  
220 shares Hale & Norcross at \$84 50 @ 83.  
300 shares Julia at \$10 15.  
82 shares Kentuck at \$157 50 @ 135.  
2020 shares Mahogany at \$10 50 @ 75.  
2531 shares Meadow Valley at \$21 50 @ 24 50 @ 25.  
655 shares Ophir at \$11 1/2 @ 10 25.  
1315 shares Ophir at \$25 @ 22 25.  
920 shares Overman at \$5 50 @ 25.  
3955 shares Pioche at \$12 @ 14 50.  
10,275 shares Phoenix at \$3 @ 15.  
4030 shares Raymond & Ely at \$21 @ 27 25.  
130 shares Monitor and Magnet at \$9.  
119 shares Savage at \$40 @ 41 50 @ 40 25.  
175 shares Segregated Belcher at \$12 50 @ 13 50.  
2170 shares Sincor at \$6 50 @ 28.  
8830 shares Yellow Jacket at \$68 50 @ 52 50 @ 53.  
400 shares Yale Gravel at \$1 52 1/2 @ 11 25.  
360 shares Ida Elmore at \$5 25 @ 4 @ 4 75.  
1075 shares Jackson at \$4 @ 6 @ 6.  
40 shares Sierra Nevada at \$17.  
815 shares Denison at \$10 25 @ 11 25.  
30 shares Imperial at \$4 @ 40.  
120 shares Lady Bryan at \$2 50 @ 27 75.  
130 shares Independent at \$3 50.  
130 shares Young at \$10 25 @ 11 25.  
100 shares San Francisco Gas at \$82.  
25 shares Pacific Insurance Co. at \$111 50.

Amount of sales.....\$1,634,923.

**CHOLLAR-POTOSI**—sold to a considerable extent at pretty uniform rates. They extracted 620 tons of ore for the week ending September 2d, showing an assay of \$40 20 per ton, against \$44 20 per ton the previous week. Nothing of an encouraging nature has recently been discovered. A dividend of \$1 per share will be paid on the 9th.—**HALE & NORCROSS** is dull of sale. Extracted 295 tons of ore for the week ending Sept. 2d. They have 2,876 tons of low-grade ore on hand.—**SAVAGE** sold to a limited extent at even prices. For the week ending Sept. 3d, 591 tons were extracted, showing an average yield of \$35 84 per ton. The sixth station is yielding considerable ore.—**CROWN POINT** is weak. A letter of the 3d says: "The 900-drift is in 85 feet; the quartz is very hard and carries a large proportion of lime. The 1,000 is in 62 feet. The ore is of good quality. The winze to connect 900 and 1,000-levels is down 75 feet, and the winze to connect 1,000 and 1,100-levels is down 24 feet. The east half of breast of the 1,000-level carries ore of a very good quality; west half very poor. The ore on the several floors above is of good quality. Since last report the breast in the 1,100-level has decreased in width 8 feet. The incline is down 125 feet. Ore extracted and shipped to mills for week ending Sept. 3d, 1,521 1/4 tons; estimated value, \$67,579 21." A dividend of \$10 per share will be paid on the 9th.—**BELCHER** has appreciated very considerably within the past few days. "The 1,100-drift is in 96 feet from Crown Point line, and looks splendid; are breasting out 20 feet in width along the west wall. Still good ore east of us. Are cross-cutting on the line, to ascertain the width of the ore. Are taking out 50 tons daily, and will be able to increase the quantity in a few days."

**CALEDONIA** yielded \$17,212 in bullion during August.—**SUCCOR** will pay a dividend of \$50 per share on the 15th.—From July, 1869, to August 5, 1871, the bullion yield amounted to \$186,000.—**MEADOW VALLEY** is advancing. Already \$150,200 in bullion has been received for account of August, with two more shipments to arrive.—**YULE GRAVEL** disbursed a dividend of 50c per share on the 4th inst.—We note the following assessments: **JULIA**, 50c per share, levied August 31st; **MAHOGANY**, \$3 per share, Sept. 4th; **ARGENTA**, 50c per share, Sept. 4th; **LUCERNE**, \$3 per share, Sept. 5th.

**Leather Market Report.**

[Corrected weekly by Dolliver & Bro., No. 109 Post st.]

SAN FRANCISCO, Thursday, September 7.	
SOLE LEATHER.—Eastern shipments still keep the market firm and the demand good.	
City Tanned Leather, #1.....	26 1/2 @ 29
Santa Cruz Leather, #1.....	26 1/2 @ 29
Country Leather, #1.....	26 1/2 @ 29
Leading French stocks have declined slightly. California kips are higher and in demand.	
Jeodot, 8 Kil., per doz.....	58 00 @ 60
Jeodot, 11 to 15 Kil., per doz.....	80 00 @ 85 00
Jeodot, second choice, 11 to 15 Kil., #1 doz.....	80 00 @ 88 00
Lemoine, 16 to 19 Kil., #1 doz.....	59 00 @ 60
Lemoine, 20 to 24 Kil., #1 doz.....	72 00 @ 70 00
Cornellian, 16 Kil., per doz.....	72 00 @ 70 00
Cornellian, 12 to 14 Kil., per doz.....	65 00 @ 70 00
Oceanau Calif., #1 doz.....	54 00 @ 55 00
Oceanau Calif., 16 Kil., per doz.....	60 00 @ 65 00
Robert Calif., 7 and 8 Kil.....	35 00 @ 40 00
Common French Calif Skins, #1 doz.....	35 00 @ 75 00
California Kip, #1 doz.....	60 00 @ 75 00
California Kip, #2 doz.....	60 00 @ 75 00
Eastern Wheel Stuffed Calif, #1 doz.....	80 00 @ 1 25
Eastern Bench Stuffed Calif, #1 doz.....	1 10 @ 1 25
California Calf Boots, #1 pair.....	1 10 @ 1 25
Sheep Roams for Topping, all colors, #1 doz.....	8 00 @ 13 00
Sheep Roams for Linings, #1 doz.....	5 00 @ 10 00
California Sheep Roams, #1 doz.....	5 00 @ 5 50
Good French Cal Boot Legs, #1 pair.....	5 25 @ 5 50
Good French Cal Boot Legs, #2 pair.....	4 50 @ 5 00
French Cal Boot Legs, #1 pair.....	4 00 @ 4 50
French Cal Boot Legs, #2 pair.....	3 50 @ 4 00
Fair Bride Leather, #1 doz.....	48 00 @ 72 00
Skirting Leather, #1 doz.....	34 00 @ 37 00
Wet Leather, #1 doz.....	30 00 @ 35 00
Leather, #1 foot.....	17 00 @ 21
Wax Side Leather, #1 foot.....	18 00 @ 28

# PATENTS & INVENTIONS.

## Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

### FOR THE WEEK ENDING AUGUST 22D.

VAPOR BURNER.—Coolidge B. Brown, Placerville, Cal. Antedated August 21, 1871.

SHIELD FOR BOOTS AND SHOES.—Orren Collier, Sacramento, Cal., assignor to Robert M. Funkhouser, New York, N. Y.

RULER.—Louis Feusier, Jr., Virginia City, Nev.

RULER.—Louis Feusier, Jr., Virginia City, Nev.

SIDE-ARM SHEATH.—Joseph J. M. Frey, Sacramento, Cal.

SCREW PROPELLER.—Henry Zahn, San Francisco, Cal.

### TRADE-MARK.

PIPIFAX BITTERS.—Walter & Shaeffer, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

PROJECTILE.—Thomas Hill, Vallejo, Cal. This invention consists in the use of two or more concentric shells, one within the other, so arranged that one shall contain the bursting charge, while the other shall be loaded with bullets, scrap iron or other missiles that are to be thrown out by the explosion. If a third inner shell is employed, this may serve to contain a small vial of liquid fire which is broken by the concussion of striking, and communicates with the bursting charge through small holes in its containing shell. If preferred, tubes are made to extend through the shell in different directions, so that some one of them shall be in a line with the direction of impact at the time of striking, and these tubes contain fulminates so arranged as to explode by the concussion, and thus ignite the charge in the shell.

CHURN.—Thomas Bee Parke, Downieville, Cal. The object of this invention is to provide certain improvements in the construction and operation of churns using double rotary dashers, and it consists first, in a peculiar form and application of the dasher arms and their arrangement so that the cream is thrown from the center of the tub to the sides, where it will be acted on by the outside beaters; and secondly, in an improved manner of securing the cover upon the churn, so that it cannot be displaced by operating, but can be readily removed if required. It also consists in a novel arrangement of the driving gear, by which the beaters are driven at different speeds, so as to give the best results. Mr. Parke has exhibited his churn during the Mechanics' Fair to many thousands of visitors, who have been attracted to witness its simple operation. After practical use, he has called it the minute churn, as an appropriate name for it.

WELT TRIMMER FOR BOOTS AND SHOES. Joseph H. Allen, Wadsworth, Nevada. By means of this invention a simple and convenient tool for trimming the welts of boots and shoes is provided, and it consists of an adjustable knife properly protected so that it shall not cut the upper leather, by means of a flat, tapering guard bent at its outer end and secured to a convenient handle. The knife is made adjustable in a holder which moves in a slot in this guard.

FARM GATE.—Michael Barthel, San Francisco. This invention is an improvement in self-operating farm gates, or rather those which are intended to be opened or closed from either side without leaving the vehicle. It consists of a gate having

a horizontal axis at the bottom and inside end of the gate, so that it can be turned about this axis when opened. Posts sufficiently tall are so arranged as to carry the operating cords to a point within easy reach of the driver. These cords lead to large pulleys at the side of the gate or the inside post. One of these wheels or pulleys is eccentric and the other concentric to their axis, and by means of other cords passing from these wheels to points on the gate, it can be opened with the utmost ease, and can be made to stand at any point, partially or fully, opened or closed by means of the eccentric pulley, and a system of compensative weights which do not in the least interfere with its action.

GOLD-SAVING APPARATUS.—George R. Evans, Virginia City, Nevada. This invention consists in the employment of an ordinary sluice having transverse slats at points along its bottom. Just beneath this sluice is placed one formed with alternate convex and concave semi-circular arcs, so that the concavities are beneath the slats above mentioned. By this arrangement the heavier particles of gold and amalgam, which are moving along the bottom of the sluice, will be carried through the slats and fall into the quicksilver contained in the lower sluice where they will be saved.

FURNACE FOR ROASTING ORES.—Stephen Ambler, Monitor, Cal. This invention relates to what the inventor calls a compound blowpipe furnace, to be used for smelting or roasting ores. It consists in a carbonizing chamber into which the wood is placed and converted into charcoal before it reaches the fires, where it is to be used as fuel. Two pipes lead into this furnace through which a blast of air is driven, one of the pipes being so arranged as to give an oxidizing flame, and the other gives a reducing heat.

Connected with this chamber is a reducing tube into which the ore is fed, and through which the heat from the carbonizing chamber is caused to pass, carrying with it the pulverized ore which passes into a revolving cylinder, which is connected with the opposite end of the tube.

## TRIAL OF THE ENGLISH TRACTION ENGINE.

We have already given in two previous numbers, the results of the trials of two traction engines in the United States, one being that of the Hyde Overland Road Steamer, provided with rubber tires, in the desert about Salt Lake, and over wild, bad mountain roads, or rather, almost no roads, with poor fuel, and no previous arrangements for furnishing either that or water. The extraordinary results and complete success of this trial have been already noted. The other trial was that of an Aveling & Porter (English) traction engine with iron tires, just imported and which was tried upon a nearly level track, under favorable circumstances, in New Jersey. This engine performed favorably, as might have been expected.

We have now to lay before our readers the results of trials made in England at the Wolverhampton show in the latter part of June, and during these trials the rubber tired engines first came into public competition with rigid or iron tires. Since Thomson, of Edinburgh, obtained patents for the application of rubber tires to the road wheels of traction engines, much has been said of the wonderful performances of such engines, and the public has been led to suppose that rubber possessed some mysterious power which enabled engines provided with tires of this material, to perform feats utterly impossible to other machines. Among these the power of traversing soft ground was pretty severely tested during the late exhibition, and by many the trial was thought to be a decided defeat for rubber tires; but, as will be seen, the trial was not so much one between elastic and rigid tires, as it was between a nearly smooth iron surface, (which the outside protecting plates or hands of the rubber tired wheels really give) and a surface

of paddles or spikes which were employed upon the rigid tires of some of the other engines. With these explanations we now proceed to

### The Trials.

The first proceedings in connection with these trials took place on Saturday, the 29th of June, and consisted merely of a trial of the engines without loads over a run of 1½ miles. The results were as follows:

Aveling & Porter's 10-horse.....	29	min.
Chas. Burrell } Thomson's road steamer.....	28	"
Chas. Burrell } 2d Trip.....	15½	"
Aveling & Porter's 6-horse.....	22½	"
Ransomes, Sims } Farm Steamer with india	24½	"
and Heads } rubber tires.....	23½	"
Chas. Burrell, 8-horse, ordinary patterns.....	22½	"

Tuxford's engine met with a mishap and did not finish. A little 6-horse engine made by Messrs. J. Fowler & Co. although not entered, made the run in 16½ minutes, notwithstanding that it was checked, by being obliged to run for some distance behind Messrs. Tuxford's engine. This, however, was nothing compared with Monday's work, when loads were to be hauled, it having rained steadily all day and night Sunday, and Monday forenoon till the course was little better than a swamp.

The first engine to make the trip was Messrs. Aveling & Porter's 6-horse engine, weighing 5 tons, 4 cwt., 2 qrs. This engine took a load of 5 tons, 10 cwt., and made the trip in 51½ minutes including 13½ minutes stoppages, these latter for the purpose of putting spikes or paddles on the wheels when an unusually bad spot was to be crossed, or to move the engine up an incline and then connect with the wagon by means of a chain, so that the engine would have the advantage in pulling the load up.

The next to start was Messrs. Ransomes, Sims & Head's 8-horse rubber tired steamer, with a load of 5 tons. This engine by dint of digging out, and a liberal use of planks and jack-screws, finally finished in 4 hours and 10 minutes. The rubber tires not only slipped on the ground, but the wheels slipped within them, and the engine was finally obliged to go home without its load. Mr. Burrell, after witnessing this trial, very sensibly withdrew his rubber tired engine, but tried one of the ordinary pattern, which made an excellent run of 1 hour and 1 minute, or deducting 28½ minutes for stoppages, a running time of 32½ minutes. This engine was 8-horse power, and drew 7 tons.

After this Messrs. Aveling & Porter started their 10-horse engine; at first with 10 tons, but afterwards they were obliged to take off 1 ton, when the engine made the trip in 1 hour and 5 minutes, or a net time of 40 minutes, although the road was by this time such a quagmire that the wagons sunk to their axles, and sometimes advanced without turning their wheels. This engine was also provided with paddles and spikes.

On the following Thursday the engines were loaded in proportion to their power, and the consumption of fuel carefully noted in making a run from Wolverhampton to Stafford, a distance of 16 miles. The chief results are as follows:

	Time.	Load.	Coal Used.
	hrs. min.	tons.	cwt. qr. lbs.
Ransomes, Sims & Head.....	3 35	12	1 6 20
Aveling & Porter 6-horse.....	4 17	9	3 2 0
Aveling & Porter 10-horse.....	4 20	15	5 1 17
Chas. Burrell, ordinary pattern.....	5 10	12	4 3 0
Ordinary Thomson patent.....	5 10	12	8 2 0

This last engine was delayed by the breaking down of one of the wagons. A steam omnibus with a light load of passengers went over the road in 2 hours, 30 minutes, using 5 cwt. 1 qr. of coal.

On Saturday, July 8th, a final and most interesting trial was had, for the purpose of testing the relative merits of the rubber tired and rigid iron wheeled engines, upon a road which should represent the average inclines that would likely to be met by traction engines, and at the same time be sufficiently steep to afford a good test of the powers of any engine. The road was carefully levelled, sights being taken every 100 yards, the first part showing a grade of 1 in 25, the next 1 in 20, the third, 1 in 18, the fourth, 1 in 22, fifth, 1 in 20, sixth, 1 in 22, the remainder being of a less gradient so that only about 1,900 feet presented any incline worth notice.

The engines tested, were one of Messrs. Ransomes, Sims & Head, weighing about 10 tons, and provided with two sets of wheels, one set having rubber tires, and the other set being smooth faced cast iron wheels.

The other engine was Messrs. Aveling & Porter's 10-horse engine with iron wheels. The engines were loaded until the wheels would slip, and in the case of the rubber tired engine one set of wheels were first used and then the other.

By this arrangement and by carefully

noting the loads and their proportion to the weight on the traction wheels, it is manifest that very satisfactory comparisons could be made between the rubber tires and the two classes of iron tires. The rubber tired engine was the first to start with a gross load of 36 tons, of which the engine weighed 10 tons, 6½ cwt., 7 tons, 9 cwt. being supported on the driving wheels. With this load the engine started with 150 lbs. of steam, and moved steadily up the incline reaching the summit in 10 minutes, 45 seconds, easily maintaining steam at 145 lbs. As it was evident that the engine had not been fully loaded, Aveling's engine was thrown out of gear and attached to the rear of the train, which consisted of three wagons loaded with pig iron and one portable engine. For 300 feet the engine went all right and then stopped by slipping her wheels on an incline of 1 in 20. The portable engine was then thrown off and she again started with a load of 43 tons, proceeding till the wheels again slipped on an incline of 1 in 18. At this point the experiment stopped, proving that the maximum tractive force of the rubber tires on an incline of 1 in 18, was equal to a load of something more than 36 and less than 43 tons.

While changing the wheels of this engine, the Aveling & Porter 10-horse engine took the three wagons and proceeded 500 feet to where the portable engine had been left standing. This being coupled on, she had the same load which the rubber tired engine had drawn, plus 19 cwt. extra weight of the engine. The engine weighed 11 tons, 4 cwt., of which 8 tons, 10½ cwt. were on the drivers. These wheels were 6 feet in diameter, 18 inch face, rising in the center 1 inch, and provided with diagonal crossing pieces. After the portable engine had been attached, the steamer again started and after slipping a good deal finally stuck at 1,600 on a grade of 1 in 22. As she had already surmounted a grade of 1 in 18, it was evident that the tractive power of the wheels had been lessened by constant slipping, which had worn them bright. The time occupied in hauling 500 feet less the distance than was traversed by the other engine, was 29 minutes, 15 seconds, and it was evident that although the iron tired engine had hauled the load up once, she could not do it again.

By this time a change of wheels had been made on the other engine, and it now started with iron tired wheels weighing 11 cwt. more than in the first case, the weight for adhesion being more than with rubber tires. The gross weight this time was only 28 tons 4 cwt. After much slipping the 1,500 feet mark was reached, when it stuck on a grade of 1 in 18 and refused to move further. The portable engine being detached the engine finally reached the top in 28 minutes after started. No more conclusive proof of the superiority of the rubber tired engine was needed, and the experiment thus terminated.

### Conclusions.

The above is condensed from the very lengthy accounts given by the English papers, and they seem to be of the opinion that while for some kinds of work the rubber tire may be useful, yet considering their great cost, and the results of these trials, the rigid tired wheels are nearly as valuable, while at the same time they are not one-half as expensive. These opinions are predicated upon the tires used upon the Thomson steamer, which being made in one piece are of a necessity very costly, liable to become damaged, and difficult to repair. These objections will not, however, apply to the California engine, which we have already spoken of several times, as by the peculiar construction of the tires they are neither costly at first, difficult to repair, nor liable to disarrangement.

NATIONAL SWINE EXPOSITION.—A great National Swine Exposition is to be held at Dexter Park, Chicago, September 19th to the 21st, under the auspices of the Illinois Swine Breeders' Association. It is expected that there will be a large attendance on the occasion, and a very extensive show of animals. Assurances have been given that nearly every prominent breeder in the Northwest will be represented. The magnitude of the hog market of the United States, annually, is at once a sufficient answer as to the utility of such an exhibition.

AMERICAN INSTITUTE EXHIBITION.—The fortieth annual exhibition of the American Institute, at New York, commences on the 7th of November, and promises to be one of unusual interest.

## ORES AND MINERALS AT THE MECHANICS' INSTITUTE FAIR.

The collections of ores, minerals, etc., in the Mechanics' Institute Fair this year, far exceed all former attempts at such an exhibition. Besides small lots and isolated specimens and samples from various parts of this coast, there are also several fine and extensive private collections. That of Mr. Cronise first attracts attention from the elegant cabinet in which it is displayed, although at the end of the room. The cabinet itself, leaving the collection aside, is worthy of special notice, and is said to have cost \$850. The contents of the cases are well selected, and the intrinsic value must be very large. The collection would be a credit to any institution in the country.

Mr. Henry G. Hanks, the well known assayer, has on exhibition 17 cases of ores, minerals, fossils, etc., which are numbered, but not described. This gentleman is the most industrious collector on the coast, and has spent a large amount of time as well as money, in getting up his cabinet, and is continually adding to it. The exhibit is a fine one, and naturally attracts much attention from mining men and especially from savans, from the variety and beauty of the specimens. This exhibit is worthy of more extended mention which we shall endeavor to give in a future number.

The first case to be seen on entering the room is that containing ores, metals, etc., from the cabinet of A. S. Gould and Son, Salt Lake City, and entered by Gov. Sam. Purdy. As these specimens are nearly all from Utah, a mining region attracting a large amount of attention, from the richness and extent of its lodes, we shall enumerate a few for the benefit of our readers in the interior.

No. 1 is the first silver ever refined from Utah ores, Feb. 1869, and a very pretty piece it is. No. 2 is a piece of horn silver from the Mountain lode, Tintic District, Utah. No. 3 arsenical sulphurets of iron. No. 38 is a very large piece of copper ore from the Mammoth lode, Tintic District. The effect of the greenish tinge from the copper on the crystallized quartz, makes this a fine specimen. No. 43, cinnabar ore from Jenny Lind ledge, Little Cottonwood. No. 42, galena from Poor Man's Friend, East Cañon, assays silver \$140 and per cent. copper. No. 31, some specimens of carbonate of lead from Star District, U. T. No. 40, argentiferous galena from Big Cottonwood Cañon. No. 44, a large piece of carbonate of lead from the famous Emma mine, average assay, \$500, per ton in silver. No. 37, silver ore from the Shoe-bridge, Tintic District, average assay \$350 per ton. No. 36, argentiferous galena from Montezuma, Little Cottonwood, average assay, \$300 per ton. No. 35, a piece of horn silver from Tampier mine, East Cañon. A piece of this specimen assayed \$10,000 per ton. No. 41, galena from the Scotia, West Tintic, average assay, \$225 per ton. No. 32, green looking ore from Jupiter, Star District, assays \$300 per ton in silver.

As showing the average assays of silver rock from Tintic District, in the vicinity of Salt Lake City, there are exhibited in the same case a number of bottles of ore, sampled by Howland & Co., of Salt Lake City, the yield of which, according to the accompanying memoranda, is as follows:—

No. 46—Mal Henrietta.....	\$1,085 00
No. 47—Grey Eagle.....	145 00
No. 48—Mountain Tiger.....	40 00
No. 49—Black Dragon.....	923 00
No. 50—Annie.....	98 00
No. 51—Montana.....	6,900 00
No. 52—Newton.....	185 00
No. 53—Ruby.....	200 00
No. 54—Milton.....	149 00
No. 55—Sunbeam.....	256 00
No. 56—Ditto.....	800 00
No. 57—Susan.....	170 00
No. 58—Martha Washington.....	500 00
No. 59—Salom.....	90 00
No. 60—Lucky.....	720 00
No. 61—Sarah Ann.....	163 00
No. 62—North Star.....	350 00
No. 63—Mammoth.....	94 00
No. 64—Wyoming.....	774 00

Some of the specimens shown in this case are from Gov. Purdy's private collection; among which is one from the Emma Jane, Tintic; and a fine large piece of argentiferous galena from the Monitor and Magnet, the average assay of which is \$100 per ton in silver, and 68 per cent. of lead. The ores from the Big and Little Cotton-

wood, and American Fork Districts are all base and require to be smelted, while that from Opbir and Camp Floyd can be milled.

In the next case are several specimens of petrifications and samples of copper ore. A cone of bullion drippings also attracts attention. A large piece of tufa is also shown. In this case, No. 1,008, is a bar of bullion from Stockton, U. T., presented by W. H. Murray, 1,020 is a large specimen of tin ore from the Star of the West, Ogden, Weber Cañon, U. T. average per cent. 246 lbs. to the ton, also by Mr. Murray.

The same gentleman presents several fine specimens from the Savage mine, Little Cottonwood. There is a beautiful specimen of yellow, blue and green ore from the "Cumberland," American Fork Dist., U. T., assaying in silver \$175 per ton. No. 29 is a handsome piece of argentiferous galena, from Bingham Cañon. A piece of salt crystallized on a twig of sage brush attracts considerable attention.

In the next case there is a large number of specimens from White Pine, one of which is a yellow piece of chloride of silver from the "Gloucester," western slope of White Pine mountain, presented by Messrs. Woodruff and Bush, the owners. A piece of white spar from Treasuro Hill, White Pine, is presented by Messrs. Woodruff & Ennor, the well known stago proprietors. The same gentleman presents a specimen from the Amazon ledge, Clifton, U. T., and several from the western slope of White Pine mountain. There are specimens in this case from the North Aurora, Eberhardt, Snow Drop, Ward Beecher Consolidated, Ballion, South Aurora and several other mines. A large piece of ore from the Blue Jacket, Bull Run Dist., Elko county, marked as assaying 600 per ton shows well. There are also six specimens from the Meadow Valley mine, Ely Dist., Lincoln county, Nevada, taken from different places in the shaft.

In the case marked "California," are several specimens of galena and carbonate of lead, from the Union mine, Cerro Gordo Dist., Inyo county, Cal., yielding 40 per cent. of lead and 50 ozs. of silver to the ton. Belmont, same dist., assays 200 ozs. of silver to the ton. There is a fine piece of "Peacock" ore from the Widdekint mine, and specimens from the Buena Suerta, Belmont, Friendship and many other mines in Cerro Gordo District, the majority of them exhibited by Mr. W. Belshaw, a smelter and refiner in that locality. These ores are all carbonates and sulphurets of lead—argentiferous of course.

San Diego county, is represented by a large piece of rock, plentifully sprinkled with free gold, from the Madden mine, Banner District. The description accompanying it informs us that \$3,600 were taken from 67 tons worked by arrastra, and that the gold is 832 fine. There are in this case a number of specimens of gold ore from Calaveras county, Cal., presented by Ira H. Reed.

In the fourth case is a piece of ore from the "Terrible" mine, Georgetown, Colorado, presented by W. H. Murray, and several specimens of gold, silver and copper ore from Arizona, presented by Chas. Gentile, Esq.

There are also several pieces of lead, gold and silver ores from Oregon, entered by A. H. Gilmore; also a fine collection of various ores and curiosities by B. F. Hughes, of Calaveras.

A case containing petrifications, ores and various curiosities belonging to Mrs. R. M. Chamberlain, attracts considerable attention. Two large crystals from Chili Gulch, Calaveras county, Cal., have been placed on exhibition, which are quite as clear and fine, as those from Japan.

Some enterprising genius has made a pyramid, covered with gold paper, representing the yield of the Thames Goldfield, Auckland, New Zealand, up to the end of April, 1871—475,396 ozs. valued at £1,524,128. Not to be outdone in this exhibit, the idea has been copied in the shape of an enormous cube, covered with gold paper representing the average yield of gold and silver for one year on the Pacific Coast, equalling in bulk 149 cubic feet, and representing \$54,000,000, the whole yield for 22 years being \$1,200,000,000.

It is to be regretted that there is not complete catalogues of these ores and minerals, for they are a center of interest to many people. The general catalogue of the Fair, gives no information on this point.

THE HARVEST.—The Willamette Farmer Aug. 19th says: Farmers are now in the midst of harvesting. The fall wheat turned out well, on many farms averaging forty bushels to the acre. The spring sown wheat and oats will not show as good yield as ordinarily.

## GOOD HEALTH.

### The Cholera.

Much uneasiness is being felt through out the Eastern cities at the threatening appearance which the cholera epidemic appears to be assuming in Western and Southern Asia, and in some parts of Europe. We hear of isolated cases in London and Paris, and are told that various measures are being taken to prevent its appearance in Berlin.

The severe famine from which many portions of Western Asia are now suffering, is thought to be nourishing the pestilence there, where it has for sometime been raging with much severity. It is evidently creeping westward slowly but surely, having already gained a firm footing in Russia, become virulent in Poland, and made its appearance in a dangerous form in the Eastern provinces of Prussia. We have even heard rumors, by telegraph, of cases in some of the Atlantic cities; but later reports have not confirmed its presence this side of the Atlantic—the supposed cases have been shown to have been cholera morbus.

It is thought, at the East, that the summer is so far advanced, that the epidemic can hardly get a foothold there this season; still careful preventory measures are strongly urged upon the officials of the various Atlantic cities.

### An Ill-Boding Insect.

Of course all sorts of rumors may be expected in such a crisis, and all the numerous crop of theories will be again brought out for ventilation—indications of its approach, theories as to cause and preventions and remedies to be employed. The latest thing in regard to the indications of its approach is that of the appearance of an ill-boding insect, called the "Pestilence Fly," which is said to have suddenly made its appearance in New York.

This insect is said to be the precursor of the cholera or other pestilence. It is a little longer than the common house fly, and has very transparent wings of a slightly purple hue. The head is perfectly round, of a dark brown color, with a white mark on the face. The body is divided like the wasp's. The round portion next the head, to which the wings are attached, is of an invisible green. The remainder of the body from the waist to the tail presents alternate rings of black jet and a pale yellow. It has six legs which are longer than the common fly's.

HEALING QUALITIES OF RED CLOVER BLOOMS.—Our correspondent "Jeigh Arrh" writes of his experience in the curative qualities of red clover, as follows: "Some years ago I had on my instep an obstinate, watery sore. I healed this over every two weeks on an average for some time. I made a strong infusion of red clover blossoms, and boiled it down to a salve. Three days use of this salve would reduce the sore, and produce a skin apparently healthy and fresh as a child's; but a few days would redevelop the evil. I believe an infusion of red clover heads used instead of tea, would prove a powerful and useful alternative; but would not advise its external use in cutaneous disorders. The facts as set forth above, you may rely upon."

CIRCULATION OF BLOOD IN THE SYSTEM.—The blood circulates through the body in about two minutes. The amount of blood will not vary much from twenty-four pounds, so that twelve pounds pass through each minute. It is estimated that the blood moves at the rate of two and a half feet in a second, or at about the rate of two miles an hour.

GENTIAN ROOT.—It is said that a little coarsely cut gentian root, well masticated (the saliva being swallowed), taken after each meal, will soon cure one of all desire for tobacco chewing. Gentian is the basis of most of the tobacco antidotes advertised.

OVERTASKED BRAINS.—Our citizens generally are deeply ignorant of the comparatively large number of business men of the city who have been taken to the Insane Asylum at Somerville for treatment, of late years. The excitements of trade, resulting in overtaxed brains, or pecuniary losses, have brought this about. Whenever such men disappear from 'Change or the counting room, it is generally given out by their friends that they have gone to Europe for the benefit of their health. A few recover after a considerable period of treatment, but to others the world is over after a blank book. A good many women, too, of the high circles of life, find here a resting place to linger for a few years, and then go down into the valley. The asylum at Somerville was never better patronized than at the present time, which fact is a striking illustration of the rapidity with which some of our business men live and die. That some men and women are confined at this place who are more sane than those who place them there, is also true. Money in the present and prospective, family difficulties, or something of that sort, is often at the bottom of this involuntary imprisonment, for which there seems to be no legal remedy.—*Boston Cor. Chicago Journal.*

REMEDY FOR DIARRHEA.—The following simple remedy for chronic diarrhea is from a medical work by Dr. Fancher: Take two pounds of the bark of the root of blackberry, and a suitable quantity of water; boil for two hours, then pour off the liquid; then add more water; continue to boil and pour off till all the strength is extracted; then strain, and add all boilings together; simmer to two quarts; strain, add four pounds of loaf sugar, and when cold, add half a pint of the best French brandy. Dose, a tablespoonful three times a day, fasting. If it does not arrest the disease in a few days, gradually increase the dose as the stomach can bear.

Another and more simple remedy is as follows: Put a teaspoonful of wheat flour in a tumbler of water; beat until it foams, and drink immediately. If the patient is thirsty, more water may be added. It should be taken four times a day—before meals, and on going to bed.

THE TEETH.—It is said the teeth have a higher office than is commonly assigned them—that of merely crushing or masticating the food. They are to be regarded as endowed with a tactile sense, a discriminating faculty, corresponding to that possessed by the muscles and nerves of the eye and ear. Teeth, it is remarked, have an extreme delicacy of discernment, both as to whether the objects comminuted be suitable as food, or such as will irritate the delicate lining of the oesophagus. How speedily do the teeth detect the smallest particle of cinder that has found its way into a freshly baked biscuit, and yet both are pulverized with much the same force and sound.

CHILDREN'S COLDS.—The following is an excellent and safe remedy: Take onions, slice thin, and sprinkle loaf sugar thickly over them; put in the oven, and simmer until the juice is thoroughly mixed with the sugar. It makes a thick syrup, very nice to take. Give a teaspoonful as seems to be needed, four or five times a day.

### Opium Culture Successful in Tennessee.

The Nashville Union says that opium is being successfully and profitably cultivated by several persons in the neighborhood of Nashville, Tenn., and thinks the State will soon be independent of the foreign supply. The crop of 1870 proved a failure owing to the lateness of the planting. Dr. J. W. Morton, who has greatly interested himself in the business and who is also growing it himself, will realize from this year's crop at the rate of from 50 to 75 pounds per acre, on which there will be a handsome profit. He obtained his seed from Calcutta.

Rev. F. Pitts, also of Nashville, has now been growing opium for three years. He obtained his seed from Smyrna. The seeds first tried did not do so well, and his crops were not a success. His crops have done well this year. He plants on good land, and cultivates much like cotton. One man can readily cultivate four acres, but it requires several to gather the crops; the season for gathering is short, lasting only about two weeks, and occurs about the middle of June. We offer these statements as an encouragement of our California growers and, with the Union, hail every man as a benefactor who can teach us to be self-sustaining—can teach us to make use of the riches that a bountiful Providence has bestowed upon us.

## Preventing Scale in Boilers.

The formation of scale in boilers is the source of very considerable expense in the way of increased consumption of fuel. Recipes without number have been given for its prevention, and the want of success attending the use of the most of them has created a prejudice in the minds of very many engineers against any new "anti-scale compound." Such a prejudice is perfectly natural, although not altogether logical.

The water used for generating steam contains ingredients in varying quantities for forming scale, which must be removed in one way or another. Blowing off frequently is a measure always to be recommended. But this is not enough in the generality of cases, and, as it gives the engineer considerable trouble, is too often neglected. The need of some material for the prevention or removal of scale is most urgent.

We notice at the Mechanics' Institute Fair an exhibit of a compound which ought to attract considerable notice. This is Rickard & Durden's Anti-Scale Compound. Without desiring to praise it above its merits, we may still say that the amplest proof has been given of its usefulness in England, where it has been thoroughly tested, and also in this city where it has been tried of late. Under these circumstances we feel justified in calling attention to it, and urging engineers to give it a trial at least. If the compound is powdered, before introduction into the boiler, it sometimes causes foaming, which it does not do when introduced in small pieces. This fact we state merely by way of caution and of urging its judicious use. A fair trial is all that can be asked for any new thing, and a fair trial of this compound ought to result, according to numerous testimonials, most advantageously to the user. That the material has merit enough to deserve such a trial, we feel confident.

## ON THE ASSAY OF GOLD.

BY HENRY G. HANKS.

(Expressly for the Press.—Continued.)

The first step to be taken in estimating the value of gold dust is to carefully examine, to see if there is any visible evidence of counterfeit, or as it is called "hogus dust." If all from the same locality, the dust will have a uniform color. Any suspicious looking pieces should be set aside and cut with the cold chisel while lying on the small anvil. A fair sample of the whole lot of gold dust under examination should then be placed in the evaporating dish, the suspected piece being placed on top, and nitric acid poured over it. If any reaction takes place such as effervescence, or evolution of red fumes, or if the acid becomes colored, there is foreign matter present and you may suspect adulteration or counterfeit.

Place two watch glasses, one on a piece of white paper, and the other on black or other dark color, then with a glass rod convey a few drops of the acid from the dish to each. To the white, add a drop or two of ammonia, a blue color indicates copper. To the other add hydrochloric acid in the same manner. If a white curdy precipitate forms, which does not dissolve upon the addition of warm water, silver is being dissolved from your gold dust in the evaporating dish. If your dust is of very low grade, these metals may dissolve in very small quantities. But such gold dust would be easily detected by its inferior color, and its appearance.

If no action is observed, even after heating the dish, there is no counterfeit present. Counterfeit gold dust is sometimes so heavily coated with pure gold, (by galvanic process) as to protect the base alloy from the action of nitric acid, hence the necessity of cutting all suspected pieces before submitting to the action of nitric acid.

To remove the acid from the gold, wash it with water thoroughly and dry it over the spirit lamp.

Select from your samples several pieces to represent as fair an average as possible, and divide each of them with the cold chisel. Then with each piece—using the fresh cut edges—make parallel marks on the touch stone, and lay the pieces of gold on the table before you in the same succession. Wet the gold streaks on the stone with nitric acid, using a glass rod or the stopper of the coin test. If no reaction takes place and the streaks look as bright and metallic as before, the gold is at least 640 fine, and probably finer even than that; wipe the stone gently with a piece of soft rag and apply the test acid in the same manner; if there is still no reaction the gold is finer than 750; if any action is observed, the fineness is between the two. If the golden streaks are not acted on by nitric acid or by the test acid, take a touch needle marked 700 and make a similar streak on the stone below those made with the samples. Compare the color, and then progress with other needles both copper and silver, using a higher mark each time until you hit on a color corresponding to that of the samples. You will thus obtain an approximate knowledge of the quality of your gold.

But should nitric acid cause any change in the appearance of the streaks on the touch stone, and your preliminary test in the watch glass indicated copper, try the copper needles and apply them in the reverse order until you hit the color, and find a needle the streak of which is acted upon in a similar manner by nitric acid. If silver was indicated, use the silver needles. Considerable practice and a good eye are required to obtain accurate results with the touch stone; but this is soon acquired.

Gold dust and retorted amalgam should also be examined for mercury. This is done by putting a small fragment into a closed tube. Drop the piece into the open end and see that it falls quite to the bottom. Place the end of the finger loosely over the open end and heat the closed end where the piece of gold lies, in the flame of the spirit lamp. If mercury is present;

a bright ring will form in the tube above the assay. Upon examination with the magnifying glass the ring will be found to be minute globules of mercury. To make certain, you can make a scratch with a file below the ring, and break the end off. Place the end of the now open tube into a few drops of water in a watch glass, and then with a feather or small stick, the sublimate may be brushed into the water, and by gently shaking be caused to form into a single globule, in which form you cannot mistake it for anything else.

A person skilled in the use of the blow pipe and who possesses a good balance, can make perfectly accurate assays of bullion or gold dust. But the results will be only approximate unless the whole lot is melted into a bar. But as this is not always convenient, the following plan may be adopted.

Pour the gold dust out on a large and perfectly clean sheet of paper, and with the ends of the fingers mix it thoroughly, occasionally lifting the edges of the paper to throw it together, and again mixing it to insure uniformity. Then from various parts lift small portions until more than an ounce is collected. This is best done with a flat knife, or by pinching it up with the thumb and forefinger. From this weigh out accurately an ounce Troy; place this in a small crucible, put in a little borax, carbonate of soda and nitrate of potash, and melt the whole together. This may easily be done in a blacksmith's forge or in a stove: when perfectly melted set the crucible aside and when cold break it and remove the gold button. This must be freed from clay by light blows of the hammer on its edges and subsequent washing. When perfectly clean weigh it again. The loss is water, iron, sand, mercury and other impurities, which may be assumed to be the average of the entire lot.

Cut off a small portion from each side with the cold chisel, wrap the pieces in paper to prevent them from flying, and hammer them down on the anvil until thin enough to cut with scissors. Place upon charcoal and heat with the blowpipe flame until the paper is burned away, taking care not to melt the gold. Cut with a pair of shears sufficient to weigh exactly the tenth of a gramme, or 100 milligrammes. A portion should be taken from each of the pieces. The weighing must be conducted with the greatest accuracy, for the success of the assay depends upon precise manipulation.

Place the assay in the center of a piece of lead foil about one-half an inch square, fold the lead over the gold, and with the fingers carefully form it into a ball and set it aside. Prepare two assays like this.

Take the cupel support in your left hand, and having lighted your spirit lamp, lift one of the cupels by placing the end of the forefinger in the concave part, and holding it lightly with the thumb, place it in the loop of wire. Heat the cupel by urging the whole of the flame upon it, producing, in doing so, a roaring sound. This is best done by holding the point of the blowpipe outside the flame. When the cupel is hot, which is known by its becoming white after first blackening, lift with the pliers one of the assays and place it in the center of the cupel. A steadily pointed blue flame is directed upon the assay until it melts and begins to oxidize, when the flame is changed and the cupel moved farther from the lamp. Cupellation goes on rapidly if the flame is directed against the cupel beyond the assay, and not directly upon it; and if the cupel is kept cool, that is to say at the lowest temperature at which the lead can be kept fluid.

It will be found advantageous to discontinue the flame for an instant occasionally and to direct it by short puffs at times. The exact point can only be attained by removing the cupel from the lamp and returning it gradually as may be required. As the cupellation goes on the head becomes more spherical; little patches of lead oxide form and pass to the cupel, becoming thinner until at last the gold bead can be seen through the slight film of oxide. When nearly finished the molten gold spits up towards the flame. At last at the proper moment, learned only by practice, an instant cessation of the blast causes a flash, and a bright yellow golden bead remains in the cupel. When cold the bead is removed from the cupel with the pliers and placed flat side down on a clean piece of paper. It is then grasped with the pincers and squeezed by a strong pressure. This generally removes all the adhering bone ash and renders the button fit for weighing. To make sure, turn it over, examine it with the magnifying glass, and brush it with the small brush. If anything should be found attached to it, a squeeze at right angles with the

first will remove it. Place the button in the pan of your balance and weigh it carefully. Its weight in milligrammes is the total fineness in hundredths; for instance, 74 milligrammes would be 740 fine. With a good balance thousandths can be weighed, each tenth of a milligram being .001.

The button probably contains silver. To ascertain the fineness of gold, it must be subjected to a second process. The weight of the head being registered, a cavity is made in a piece of charcoal, which is held by means of the charcoal support. In the cavity is placed the gold button with four or five times its volume of pure silver and both metals melted together, before a strong blow-pipe flame. The alloy must be thoroughly melted. When cool, it is wrapped in paper, hammered flat, heated red hot, to burn away the paper, cleaned with a stiff brush and placed in a test-tube with nitric acid, which is boiled over the spirit-lamp until no more red fumes are given off; a black powder, which is gold—will remain. The tube is then filled up with distilled water, which is poured off carefully so as not to permit any of the gold to pass off with it. This must be repeated and the tube filled full for the third time, with distilled water; a dry cup is then placed over the tube like a cap, and both inverted together. The gold falls to the bottom of the dry cup and the tube is carefully removed.

The water is then poured from the gold in the dry cup, which is dried at a gentle heat, and then heated red hot by the aid of the blowpipe. During the process, the dry cup may be held, by the aid of the pincers, over the flame of the spirit lamp, which is urged upward against it from below. When the gold has assumed its metallic color, the operation is finished. When cold, the gold is brushed into the pan of the balance, and its weight noted.

The results may be written as follows:

Suppose the weight of the cupelled button to be in milligrammes, 74, the total fineness will equal.....	740
Weight of gold powder 69, equals.....	690
Fineness of silver.....	950
Or, fineness of gold.....	690
Fineness of silver.....	950
Total fineness.....	740

Results still more accurate may be obtained by the aid of a balance capable of indicating tenths of a milligramme.

[To be continued.]

## Patent Infringement Decisions.

The suit in the United States District Court, of Michael Siebert vs. W. T. Garratt, for alleged infringement of patent, was decided on the 1st inst.; the jury bringing in a verdict for the plaintiff, with damages laid at one dollar. The suit was brought to restrain the defendants from the application of certain improvements in the lubrication of steam engines, patented by Siebert. The lubricators are on exhibition at the Mechanics' Pavilion, and the jury went to see the machine in operation before rendering the verdict. A stay of ten days was granted by the court.

In New York city on the 1st inst. Judge Blatchfield ordered a decree in favor of R. A. Telghman, of Philadelphia, against Roland Mitchell, for \$229,000 for infringement of his acid and glycerine patent. This is the largest decree for infringement of patent ever granted in New York.

## Queries for Mechanics.

EDITORS PRESS:—Following the idea suggested by Mr. E. H. Davies, in your issue of Aug. 12th, I beg leave to propound the following:

Why are the eyes made so small, and of a round shape, in striking hammers for drilling, and in rock breaking hammers?

Timber becomes very brash by exposure to our climate, and the frequent breakage of handles is a serious inconvenience. The eye of a hammer should be as wide as they are now made, and elongated, or of an oval shape, about the same as the handle, where it is grasped by the hand, except that it should be a little smaller. MINER.

MR. L. P. MCCARTY will next week commence a corresponding and business tour in California for the Press. We bespeak for him such friendly reception and courteous assistance as our friends have ever found it pleasant to mete out to our traveling assistants, while engaged in advancing the cause of industrial progress.

Hill's Patent Eureka Gang Plow.

We herewith present an illustration of a gang plow invented by Mr. Frank A. Hill, of Marysville, and for which a patent has been obtained through the agency connected with this office. The patentees claims: "First,—an improved arrangement of levers for raising and lowering the frame on the axle, so as to throw the plow in and out of the ground. Second,—an improved manner of attaching the upright standard which connects the plows with the frame to the landside, so as to secure strength and stability; and third,—an improved manner of attaching the pole to the axle so that its direction and position can be readily changed, when desired. They are made of the best material, under the immediate supervision of the patentee; they are of very light draught, the dead force usually brought against sharp, curved mold-boards being entirely done away with. They can be readily adjusted to cut a furrow of any required depth. The principle which regulates them is so simple that they are easily controlled by a boy. They are adapted to any soil, working equally well in sand, clay, gravel or adobe. Each plow is warranted to give satisfaction or no sale.

These plows have been in use three years, and are giving very general satisfaction. They took the first premium at the State Fair, Sacramento, in 1870; at the Northern District Fair Marysville, in 1870; and at the Upper Sacramento Valley Fairs in 1870 over all competitors."

They combine durability, lightness, cheapness and light draught. The plans combined in their structure have been the result of experiments with a view to manufacture a perfect plow. They are now in use on hundreds of ranches in Yuba, Sutter, and other counties, and in every instance, so far as we have learned, they have given perfect satisfaction. The proprietors feel that in offering this plow to the public, they have given them an article that is its own best advertisement where used. They are also manufacturing a single plow which cuts from twelve to fourteen inches in depth, turning a furrow from sixteen to twenty inches wide. This plow will turn  $3\frac{1}{2}$  acres per day. Hill & Knaugh, Marysville, manufacturers, keep both varieties on hand. These plows may now be seen on exhibition at the Mechanics' Institute Pavilion, and will also be shown at the State and District Fairs.

Borax.

The richest borax deposits in the United States are to be found in Nevada. Among them are deposits belonging to one company which cover an area of 20,000 acres, at Columbus, Fish, and Toal Flats or Lakes, Esmeralda county, 140 miles south-east of the C. P. R. R. This is said by blacksmiths, who have tried it, to be superior to the best English borax. The crude mineral consists of horate of lime, and borate of soda, mixed with sand, mud, carbonate of soda, chloride of soda and magnesia. The supposition is that warm springs of horacic acid rise in these flats or lakes, and that the acid uniting with the lime of the country rock, or with the soda formed in the flats, forms the borates. At some points, a few feet below the surface, the water is quite hot. There are also borax deposits in Lake county, Cal., which yield a very good article. The annual consumption of this useful substance in the world, is estimated at 11,000 tons.

THE YOLO COTTON EXPERIMENTS.—We understand that Chas. F. Reed, Esq., President of the State Agricultural Society, instead of the Railroad Company, is making the experiment in cultivating cotton at Knights' Landing, Yolo county.

An inch of rain falling on an acre of ground supplies it with 100 tons of water.

The Loss of Quicksilver.

Some time ago, a correspondent asked the readers of the SCIENTIFIC PRESS for opinions as to whether the loss of quicksilver in silver amalgamation, was in proportion to the amount of ore treated, or to the amount of silver extracted. The question being put rather to correspondents than to the editors, we have waited a considerable time for answers to the query. Only one, however, has been sent, and that was to the effect that the loss is proportional to the amount of silver extracted, where the treatment was properly conducted.

There is a saving clause in the above answer which puts it beyond the reach of discussion. In the working of silver ores, as actually conducted, however, the loss of mercury will be found to be in proportion to the gross amount of ore worked, rather than to the amount of silver obtained. For example:—Five tons of ore yielding \$100 per ton will occasion a greater loss than one ton of the same character of ore which yields \$500 per ton.

The loss of mercury is partly mechanical, and therefore proportional, to this extent,

HILL'S PATENT EUREKA GANG PLOW.

to the amount of material treated. It is also partly chemical, and affected not only by the silver mineral, but also by many of the other constituents of the ore. While it is influenced by the quantity of silver, it is also influenced by other metals and combinations, and these and mechanical causes have so much greater effect relatively that we naturally find the result as above stated.

It would be interesting to have a collection of facts as to the amount of loss of mercury. One can get general figures easily enough; but these figures are generally rather guesses, than facts carefully ascertained. The amounts naturally vary greatly at different places. We know of one mill, running on tailings, where there is said to be no loss at all,—whether due to the mercury already in the tailings or to a particular process (not made public), is not yet ascertained with absolute certainty. If any of our kind readers can give us real facts in the case, we should be happy to publish them. Mr. Almarin B. Paul lately gave us some figures on the Wastage of Precious Metals. These figures are really valuable, and we should like to hear more of them, either from Mr. Paul or some other of our contributors.

THE ASIATIC RINDERPEST.—Dispatches from Shanghai to the State Department show there is some possibility that the dreaded rinderpest, shut out from the United States by legislative enactments relating to the Atlantic seaboard, may effect an entrance on the Pacific coast. The disease is passing through Siberia to the Eastern shores of Asia. It is suggested that, as there is considerable traffic in skins between the extreme north of that continent and America, germs of the pest may be thus transmitted to the United States.

NOTES AT THE S. F. MECHANICS' INSTITUTE FAIR.

[In these notes we have room only to notice briefly such articles as come specially under our observation. More replete descriptions of the most interesting and instructive exhibits will be given in the Press at our greater leisure hereafter. No classified catalogue being published we do not in this number give complete notices in any particular department.]

THE EUREKA EARTH CLOSET, exhibited by R. R. Strain & Co. is an improvement invented by Mr. Strain, one of our pioneer mechanics. Their manufactures include commodious as well as stationary dry earth closets, simpler, cheaper, and of better construction than any imported article from the East, where the use of such closets is being rapidly extended.

BLACK LOCUST WAGON HUBS from wood of California growth, are exhibited by E. Soule, an enterprising wagon manufacturer of Sacramento. His California made wagons are worthy of special attention.

THE "UNION DAIRYMEN" PATENT CHEESE VAPOR apparatus for operating curd economically, will be explained by T. G. Anderson, agent, of Gilroy.

F. B. Lamm has an improved milk cooler, which we are satisfied is a good thing for

tumbler, and other operative parts of the old lock are on the outside and unguarded.

TAY'S PATENT WINDOW CURTAIN is one of the California inventions taken up by Eastern manufacturers. A. C. Anstin represents it for the Meriden (Ct.) Curtain Co. The shades are held and adjusted by a simple arrangement of cords and double acting pulleys, so as to cover the whole, or any part of the window, as desired. Once introduced we believe it will be very popular.

CALIFORNIA MADE ROPE, of various sizes, and of the best quality comes from Mossrs. Tubbs & Co.'s extensive factory on the Potrero. We recommend hay makers and all other rope users on the coast, to examine the goods at the warehouse, and keep their money as near home as practicable.

THE FRENCH GAS ENGINE imported by Mr. F. L. A. Pioche occupies a prominent place and affords power for the large Adams' press of the *Daily Fair Gazette*, published by Francis & Valentine. A charge of common illuminating gas, mixed with an equal quantity of air, is introduced into each end of the cylinder alternately, and discharged by connection with constantly burning gas jets at the proper moment by the working of suitable valves. It is quite a large but compact machine, and supposed to be an improvement on the Lenoir engine which has been worked successfully in the San Francisco *Daily Courier* office for several years. The gas in the latter is fired by electricity.

THE WIRE WORK of J. M. Eckfeldt & Co., comprises some very handsome rustic patterns of ornamental work for out door use.

NEW ZEALAND FLAX is shown by W. H. Webb, S. F., who can probably afford information and perhaps seed.

SALT LAKE CITY, through John W. Young, sends (besides rich minerals), samples of cotton, Camel's hair, and a fragment of Fremont's boat used on the lake in 1843-44.

PAPER UMBRELLAS AND OVERCOATS, waterproof, are among the useful Japanese novelties. The coats are made of different colors and qualities with the appearance of being durable and suitable for wear, and without inspection would pass for oil cloth. Their raw material for making ropes, paper, and a fabric similar in looks to cotton cloth, appears superior, and in the land and hands of Yankees would doubtless be introduced throughout the world.

IF THE JONES PLOW is of as hard steel as claimed by its introducer from Naperville, Ill., Mr. O. C. Ely, it will become better known to our farmers.

A STEEL TRUCK is shown with a self-acting ratchet which prevents the backing of its wheel when the handles are tilted up to receive the load. The wheels are free to move forward at all times, and backwards when the handles are not highly elevated. It is believed to be a new and excellent device. Mr. A. V. Smith, offers liberal terms for his patent for want of means to manufacture properly himself.

CHAS. O. FARCIOT exhibits an original and finely furnished lathe for small and precise work. Also his little wonder of a steam engine, made of Washoe silver and exhibited on the DAILY FAIR Press counter at the previous fair.

THE PACIFIC IRON WORKS exhibit cast iron pipe made (by their newly introduced method), in iron moulds, whereby its product is greatly cheapened. Their

[Continued on page 156.]

## DOMESTIC ECONOMY.

### Delicious Summer Beverages.

Very few of our readers, we imagine, have any idea of what they are actually swallowing when they sip the "delicious summer beverages," which are served up, sweetened and toned by the various syrups in use. To those who are not posted we commend the following:—

Butyric ether is the base of all fruit syrups. Butyric ether is made sometimes of rancid butter, though old rotten cheese is generally preferred, the loudest variety of Limburger affording the best quality of ether. The cheese is treated with sulphuric acid, and if a particularly nice and finely flavored ether is desired, a few chips of old leather are added. Any sort of leather will do, but old hoots and shoes are preferred. Strawberry syrup is made of twelve parts of butyric ether, and one part of acetic ether, diluted with alcohol water. A pint of real strawberry syrup added to a gallon of mixture will improve the syrup, but it is not absolutely necessary; color with cochineal. Raspberry syrup is made after the same formula, except that a pint of real raspberry syrup is added, if the chemist has it. If not, he takes a jar of his strawberry syrup, colors a little darker, and changes the label. Sarsaparilla is the simplest of the syrups. Molasses is its base, with a little essence of sassafras and wintergreen added. A few roots of sarsaparilla "biled" in the mixture will do no harm and no good. Vanilla syrup is made of tonqua beans and fresh hay. Pineapple syrup is made of butyric and formic ether. Formic ether was formerly made by the action of sulphuric acid on red ants, but latterly is made of glycerine and soap. Peach syrup is made of bitter almonds and acetic ether. Twenty drops of oil of bitter almonds will kill a man. Nectar is formed by mixing various syrups and adding a little Madeira wine, the wine being compounded of neutral spirit, logwood, sugar and raisins. Lemon syrup is the purest that can be obtained. It is made of citric acid and sugar, with perhaps a few lemon peels. The citric acid is made of lemons. For people who are not particular what they drink, the above are "perfectly harmless" beverages.

Farmers and others who make their own beverages, have the satisfaction of knowing positively what they are drinking, besides getting them at a greatly reduced cost.

**HOW TO KEEP A CHURN FROM FROTHING OVER.**—Happening one day to visit the house of a friend who kept a cow and made butter, I there saw a simple method he used to overcome the great trouble of all butter-makers using the old-fashioned upright churn, viz: Take the body of the churn and cut a groove around the inside of the mouth, about three inches from the top, and three-eighths of an inch deep, and then remove half the thickness of the wood, making a shoulder all around; then take the cover and cut it to fit nicely inside, and you have now done away with all the old nuisances of cloths, tubs, pans, etc., heretofore required to save the cream that flowed over. Anyman, almost can do this, or the churn may be taken to a carpenter and treated for a few cents. Many an idea of less consequence than this is patented, but all may take this one for what I gave for it.—*Home Journal*.

**HOW TO CLEAN SMOKY WALLS.**—A New Bedford correspondent of the *Hearth and Home* writes as follows: After trying various other expedients for cleaning walls that have been badly smoke-stained, I finally used a strong solution of common washing soda, purchased at the corner grocery-store; and although the smoke had struck through the "hard finish," he says he soon had the satisfaction of restoring the walls to perfect whiteness. The soda-wash can be successfully applied, he adds, either before or after whitewashing.

**HOW BRIDGET MENDED THE STOCKINGS.** We were amused the other day,—says the *Portland Tribune*,—at a lady friend's account of the manner in which her Irish servant girl mended her stockings. When a hole appeared in the toe, Bridget tied a string around the stocking below the aperture and cut off the projecting portion. This operation was repeated as often as necessary, each time pulling the stocking down a little, until at last it was nearly all cut away, when Bridget sewed on new legs, and thus kept her stockings away in repair.

### Shaking the Table-cloth.

"Mercy on us! Carrie, where did all these pieces of bread and cheese, of cake and sandwiches, dried beef and pie, come from? Enough to make some hungry child a meal."

Carrie looked out of the window. It was her father who had spoken. He was standing on the icy pavement before the door, regarding her curiously.

"Oh," said she, "it is where I shook out the table-cloth."

"Where you shook out the table-cloth, my daughter!"

Carrie's mother was a very careful woman; but she had been sick a day or two, and the work had been done by Carrie.

Her father was all ready for a walk, his overcoat buttoned to the chin, his fur cap drawn over his ears, and an umbrella in his hand; but he turned and came back into the house and sat down. Carrie knew that a lecture was coming. Now, like most small girls and some large ones, she was not fond of lectures; but in the present case it could not be helped, and she knew she deserved it; so she submitted with the best possible grace.

"My daughter, if you want to grow up to be a careful, prudent woman, and do honor to your mother's training, you must be careful how you shake the table-cloth. Many a man, despite his hard toil and labor, has been kept a poor man for life, just because his wife did not know how to shake her table-cloth."

"If you want to have something to help the poor and needy, the aged and infirm, and such as are not able to take care of themselves, whom the Saviour said we should always have with us; and whosoever we would, we might do them good, be careful how you shake your table-cloth."

"If you want to have means to do good in any of the many ways that are always at hand; if you want to have something to lay by for a sick or rainy day; if you want to have money to buy hooks and magazines, that you may be able to store your mind with useful knowledge, be careful how you shake your table-cloth."

"In short, if you want, when you come to be a woman, and begin life for yourself, to have things comfortable around you, and be independent and enjoy a competence, you must be careful how you shake your table-cloth."

**MIXED SALADS.**—Salads are chiefly composed of lettuce, mustard, cress of various kinds, sorrel, parsley, green onions, the tops of young spinach, corn salad, mint, endives, celery, radishes, young beets, boiled beet-root, watercresses, etc. All or any of them should be fresh gathered, and when nicely trimmed, repeatedly washed in salt and water, and well drained. The smaller salads should be put in a clean cloth, and slightly shaken, but not pressed. They should then be arranged in a salad bowl; the celery, also divided, put in the center, and the smaller salads, such as radishes, mustard, and cress, placed between. When salad sauce or dressing is used, it should not be mixed with the salad, but put in the bowl first, the salad cut in small pieces and laid lightly over it, and the top ornamented with the boiled whites of eggs cut in rings, and slices of beet root; or the same may be served separately.

**CRACKED WHEAT.**—For a pint of the cracked grain, have two quarts of water boiling in a smooth iron pot, over a quick fire; stir in the wheat slowly; boil fast, and stir constantly for the first half hour of cooking, or until it begins to thicken and "pop up;" then lift from the quick fire, and place the pot where the wheat will cook slowly for an hour longer. Keep it covered closely, stir now and then, and be careful not to let it burn at the bottom.

Wheat cooked thus, is much sweeter and richer than when left to soak and simmer for hours, as many think necessary. White wheat cooks the easiest. When ready to dish out, have your molds moistened with cold water, cover lightly, and set in a cool place. A handful of raisins added with the wheat is nice. Eat warm or cold, with milk and sugar.—*Herald of Health*.

**BLACK TEA.**—Is best boiled five or six minutes. Use a little larger quantity of leaves, as they are lighter than the green. Some persons prefer the two kinds mixed; it makes a pleasant beverage. Use only the best teas. Souchow is considered the best black; the Hysons are the best green teas; Pearl and Imperial Gunpowder are very fine. Good tea has an agreeable odor. Keep it well protected from the air.

### Domestic Receipts.

**COLD DRESSED VEAL.**—Mince fine the fat and lean of cold roast veal, season it with grated nutmeg, lemon peel, pepper and salt, moisten it with a little stock or gravy, and a beaten egg; butter a pudding pan, put in the mince and press it firmly; put on a close cover, set it in a pan of scalding water and let it boil an hour or two. Then turn it from the pan, rub it over with the beaten yolk of an egg, then sift on bread crumbs thickly, and brown in the oven, basting it occasionally with melted butter.

**TO SAVE FRUIT WITHOUT SUGAR.**—Put in wide-mouthed bottles; fill up with cold spring water. Put them in a vessel of water up to the neck; boil half an hour; tie bladders or oil skin over tight, or cork and seal while hot. Let them set until cold. Keep in a cool place. Use as soon as opened. Pack hay around while boiling, to steady them.

**CRAB-APPLE PRESERVES.**—Make a syrup of equal weights of sugar and apples. Let the apples simmer in water until their skins come off easily. Then remove the core with a sharp knife. Boil the apples in the syrup till tender; then spread them on dishes to cool. Afterwards put them in jars, pouring the syrup over them.

**A SURE WAY TO REMOVE TEA STAINS.**—Mix thoroughly soft soap; rub on the spots, and spread the cloth on the grass where the sun will shine on it. Let it lay two or three days; then wash. If the stain is not all out, it will disappear in the second washing. If the spots are wet occasionally while lying on the grass, it will hasten the bleaching.

**HOP BEER.**—Take one quart of hops, three quarts of wheat bran, and three quarts of molasses; boil them in three gallons of water for an hour. Strain the mixture; turn into pails or kegs; when lukewarm, add half a pint of yeast; let it ferment over night, and bottle next morning. Tie down the corks tightly, and in two days it will be fit to drink, and will keep so, if tightly corked. It is nearly as good as beer made with malt.

**ROOT BEER.**—Take spruce boughs, black birch bark, sarsaparilla, wintergreen leaves, sassafras, yellow dock, and dandelion roots; boil all together in a large kettle, with a handful of hops and two quarts of molasses. When boiled enough—two hours or so,—strain through a sieve, cool, and add a pint of yeast. If not very sweet to the taste, add more molasses. Let it work over night, and bottle. Secure the corks tightly, and it will foam well. The same can be made in larger quantities, and put into a 15-gallon cask, and worked from the bung-hole for a few days, but it would not foam so well as if bottled.

### Mechanical Hints.

**BLEACHING SHELLAC.**—Boil any quantity of shellac in water in which borax has been previously dissolved. Continue the heat till not a particle of shellac remains whole, strain the liquor, and then pass through it very slowly a stream of chlorine gas from a heated retort, until the product becomes quite white, then slowly evaporate and wash the residue several times in cold distilled water.

**GUMS FOR VARNISH.**—It is stated that the most valuable gum for varnish making is obtained from Zanzibar. The next in value comes from Benguela, while a gum used for inferior qualities is known as Kowrie.

**A HINT.**—An English coach painter lately wrote to a brother residing in this country, asking of him, that he would ascertain what method American painters adopt in order to produce the brilliant finish which he had noticed on American coaches sent over to England. The reply was "the Americans build up a firm foundation, free from tackiness, and the finishing coat thereby retains all its brilliancy. At home you use every coating too elastic, from the priming up."

**TO GIVE WOOD A GOLD, SILVER, OR LUSTRE.**—Grind about two ounces of white beach sand in a gill of water, in which half an ounce of gum arabic has been dissolved, and brush over the work with it. When this is dry, the work may be rubbed over with a piece of gold, silver, or copper, and it will in a measure assume their respective colors and brilliancy. The work may be polished by a flint burnisher, but should not be varnished.

**TO IMPROVE GILDING.**—Mix a gill of water with two ounces of purified nitre, one ounce of alum, one ounce of common salt; lay this over gilt articles with a brush, and their color will be much improved.

## LIFE THOUGHTS.

BE praised not for your ancestors, but for your virtues.

A MOTHER'S prayer will draw up from the depths of the sea.

A SMILE may be bright while the heart is sad. The rainbow is beautiful in the sea.

A FATHER'S blessing cannot be drowned in water, nor consumed by fire.

SELF-LOVE exaggerates our faults as well as our virtues.

MISERY leads to despair; aggrandizement to presumption.

To-morrow has no overflow to atone for the loss yesterday.

WE use riches as children use toys—to amuse us till we fall asleep.

HE who gives for the sake of giving, of thanks knows not the pleasure of giving.

KNOWLEDGE raises us above the brutes but love erects us above ourselves.

MEN and women make the world, as head and heart make the human life.

A PERSON who undertakes to raise himself by scandalizing others, might just as well sit down on a wheelbarrow and wheel himself.

THERE is no funeral so sad to follow as the funeral of our own youth, which we have been pampering with fond desires, ambitious hopes, and all the berries that hang in poisonous clusters over the path of life.

THREE-FOURTHS of the difficulties and miseries of men, come from the fact, that most want wealth without earning it, fame without deserving it, popularity without temperance, respect without virtue, and happiness without holiness.

HE who has his brain full of grand theories may awe his friends with fine words and flourishes, and seem to be a great man, but if he makes no practical application of his theories, he would amount to more if he went to sawing wood and talk less.

### Life Incident.

I once knew a lawyer, writes a lady, great in his profession and great as a man. He would pause on his way to the court house, where life and death, through God's permission, hung upon his words, to speak a word of comfort or counsel and give a needed dollar to an indigent hegger by the wayside; he would turn from a crowded court house, where hearts had laughed and wept at his bidding, and turn his steps homeward to romp and play with his children. Such a man I knew once. It was worth all of my life to have known him. This man died ere the full meridian of life shone upon his honored head, and I continued to know his widow. In course of years she married again, and raised up children by this marriage. It seemed to be quite a point with her to assure them that she loved their father full as well as the first husband. I thought I detected that this was as much to persuade herself as them, and felt curious to know the truth; so upon an occasion after she was done uttering these assurances I turned quickly to her and said: "Suppose an angel were to appear now before you, and say, 'Will you have your first husband back?' what would be your answer?"

In an instant the tears gushed from her eyes, her voice trembled, and with arms outstretched to heaven she exclaimed:

"I would say, oh, give him to me! give, give him to me!" The next instant her hands fell beside her, her head dropped back, and, pale as death, she murmured, "It was cruel, Susan!"

This was after she had been married twenty-three years to the second husband, and gray hairs crowned her brow with their pure glory; and I give it to show how long such a man as I have described lives in the hearts of those left behind, in unaltered love and honor. Oh, that earth possessed more such.

A WORD TO THE UNSUCCESSFUL.—Very few men are permitted to be successful; very few men are permitted to be wise; very few men are permitted to be eloquent; very few men are qualified to be statesmen; very few men are good for anything eminent; and even those that are eminent are men with like passions with every one else. Therefore be not discouraged because it is your lot to be in humble circumstances—because your work is insignificant in the eyes of men—because you are called to labor in obscurity. The time is coming when all earthly distinctions will be of very little account.

five years experience, and employs none  
but experienced workmen.  
ORDERS from the country attended promptly.  
8v23-3msa

CRAIG & BREVOORT'S

Patent Condenser for Steam  
PUMPS, &c.

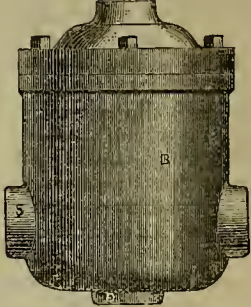

NO. 1.

The annexed engravings represent a Condenser in-  
tended to be attached to the ordinary steam pump,  
thereby bringing it within the class of low pressure, or  
more properly speaking, of condensing engines; the  
steam, when it has done its work in the cylinder, in-  
stead of being exhausted into the atmosphere, is con-  
ducted to the condenser, on its entry into which, it  
meets the water drawn by the pump, and is immedi-  
ately condensed.

The Cut No. 1 represents a vertical section of the  
Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the  
pump, and the flange S to the pipe leading to the well,  
or whatever source of supply the pump may have; W is  
a water jacket surrounding the main chamber of the  
condenser, B, and with which the suction pipe, S, com-  
municates, permitting a free circulation of water within  
the jacket and into the hollow cover or top through the  
series of openings, one of which is shown at A, and  
from thence into the body of Condenser, B, through  
pipe P, carried by float F; the pipe P also acts autom-  
atically as a valve to enlarge or contract the space  
through which the water enters it, by which means the  
possibility of the condenser being at any time flooded is  
avoided. The pipe P, it will be observed, also acts as a  
guide to float F.

The valve, C, (shown in Cut No. 1), which is raised or  
lowered by means of screwed stem—shown coning  
through elbow in Cut No. 2—is for the purpose of in-  
creasing or decreasing the flow of water according to  
the capacity of the pump to which it is attached.

NO. 2.

The exhaust pipe from steam cylinder is screwed into  
cover at E; the exhaust steam is thus thrown directly  
into contact with the water entering the condenser on  
its way to water cylinder of pump through D. A  
vacuum being of course immediately formed, acts on  
the exhaust side of the steam piston, aiding it in its  
work. If at any time it is desirable to run the pump  
without the condenser, it is only necessary to turn the  
three-way cock, which is placed in the exhaust pipe,  
into such a position as to cause the steam cylinder to  
exhaust into the atmosphere; when this is done the  
pump is perfectly free from the condenser, and acts as  
if it were not attached. This condenser is specially  
useful for pumps running in mines, or any other po-  
sition where trouble is experienced in getting rid of the  
exhaust steam. Address  
H. L. BREVOORT,  
6v23-cowly 123 Broadway, New York City.

AMMONIACAL PREPARATION

—FOR THE—

Prevention and Removal of Boiler Scale.

MANUFACTURED BY THE

San Francisco Gas Company.

F. I. CURRY, Sole Agent, San Francisco Boiler  
Works, 123 and 125 Deale street, San Francisco.

This Preparation is proved by the experience of many  
of our best machinists and engineers to be a perfect cure  
for the vexatious and dangerous incrustation known as  
Boiler Scale. It is sold in 5-gallon cans at \$5.25 per  
can, or in cases of two cans each at \$10.50 per case.

The San Francisco Gas Company also manufactures

Carbonate of Ammonia.  
Muriate of Ammonia.  
Sulphate of Ammonia.  
Liquor Ammonia, Concentrated.  
Aqua Ammonia, F. F. F.  
Concentrated Crude Ammonia, for Ice  
Making and other manufacturing purposes.

Pacific Bridge Company

Are prepared to build Wooden and Iron Bridges on  
SMITH'S PATENT TRUSS PLAN.  
Plans and specifications furnished to counties or per-  
sons desiring to build. Lithographs and prices sent on  
application.

Smith's Cast Iron Pier, durable as stone, and  
adapted to resist rapid currents, put in at low rates.  
Address PACIFIC BRIDGE CO.,  
3v23-3m-cow Oakland Cal.

[Continued from page 143.]

Wright's patent cut-off engine has now worked splendidly through two exhibitions.

TWO METALLIC BURIAL CASKETS exhibited by Craig & Son, inventors, were made in this city at Savage & Sons' Empire Foundry.

SPECIALLY WORTHY of mention are the designs and wood cuts of Crane & Curtis, young ladies deserving of the utmost praise for a noble example of usefulness and successful talent. The fine drawings on wood in their case are by their associate, Mrs. May Curtis Richardson.

A DOUBLE-SECTION SPRING BED, by R. J. Ordway, 1116 Market street, is a new invention and the most elastic sleeping apparatus yet out.

PICKS.—John Wright; shows his superior S. F. manufactured solid raised eye picks, viz:—drafting pick; drafting or quartz pick; surface or R. R. pick; pole pick.

J. H. CULVER has an ingenious machine for cutting twist mouldings rapidly, of various styles and sizes, and of any desired length.

AN AGRICULTURAL WREATH, by Mrs. J. D. Galloway, is a beautiful piece of fancy work, and shows how easily the most common things of nature can be wrought into beauty and elegance by skillful and tasty fingers.

WOODEN HORSE COLLARS.—This is a most useful and practical invention, the value of which is fully attested by a large number of farmers and others who have used it. Among the advantages which this collar is said to possess over those of the ordinary make, is the fact that it never changes its shape, always bearing where it was designed it should, and thereby avoiding the frequent cause of galls, sores, swellings, etc., resulting from the change of shape and bearing in stuffed collars. Wood moreover is a good non-conductor of heat, and is impervious to moisture—two important considerations in a horse-collar. It is easy to fit, and its length or width can be changed in a moment. It is fast being adopted into use by the government. Manufactured and sold by Wildman & Marble, No. 30 California street.

ARTIFICIAL STONE.—The Pacific Artificial Stone Co., under the Ransome patent, makes a fine display, suggestive of a new and important industry, that they have recently introduced upon this coast. They exhibit fountains, vases, steps, paving-stones of various colors and patterns, cemetery work, and building stone of diverse patterns, both plain and ornamental. The facility with which the sand of our hills is converted into the best and most durable kind of building stone, moulded with plastic to any form desired is truly wonderful. The stone work of the fine church now being constructed on Post street, is supplied by this company.

THE DRAWING of a hydraulic engine is shown by Chas. C. Rueger, one of our young mining educated Californians.

GARRATT'S STEAM CYLINDER LUBRICATOR can be better understood by examining the cut in our advertising columns, than by description here. Like its inventor and patentee, it is very popular with its familiar acquaintances.

N. SIEBERT'S EUREKA LUBRICATOR, is a meritorious California patented invention, handsomely manufactured by Weed & Kingwell, who have a creditable display of work from their Cal. Brass Foundry.

[To be continued.]

ELKO, NEVADA.—The traveler over a desert appreciates a good hotel. For this reason we are asked to mention J. D. Treat's excellent accommodations at the above named "city," where overland trains stop, for meals, going eastward west. Elko rejoices also in a new brick school-house. The C. P. R. R. hold the coal beds at this point which are said to be of important value.

### New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

NORTHERN HYDRAULIC MINING Co.—Trustees: W. H. Knight, W. H. Miller, H. C. Lee, Samuel Ambrose and J. K. Brett.

PLUTO MINING and METALLURGICAL Co.—Capital Stock, \$1,000,000 in 10,000 shares. Trustees: Edward Wolleb, Adam Hoag, and E. L. Loschenkohl.

LITTLE BUTTE CHANNEL GOLD MINING Co.—Capital Stock, \$100,000 in 10,000 shares. Trustees: B. O. Hodge, W. Ayer and J. H. Madison.

DRY DOCK TUNNEL and FLUMING Co.—Capital Stock, \$5,000,000 in 50,000 shares. Trustees: F. J. Potter, G. F. McPherson, John Skinner, F. D. Atherton and B. G. Lathrop.

SAN FRANCISCO BREAD MANUFACTURING Co.—Capital Stock, \$100,000 in 1,000 shares. Trustees: J. J. Haley, W. H. Gladwin and O. Geddes.

MARIN COUNTY WATER Co.—Capital Stock, \$600,000 in 600 shares. Trustees: W. T. Coleman, Chas. Mayne, C. J. Brenham, J. Mora Moss and M. J. O' Connor.

EMMA HILL TUNNEL and MINING Co.—Capital Stock, \$500,000 in 10,000 shares. Trustees: E. H. Shaw, J. M. Selover, W. S. Woodhull, G. W. Rose and G. H. Bradford.

GOLD RUN MINING Co.—Capital Stock, \$250,000 in 2,500 shares. Trustees: Joseph Badger, T. C. Walker and J. M. Maguire.

SAN JOAQUIN and KINGS RIVER CANAL and IRRIGATING Co.—Capital Stock, \$10,000,000 in 100,000 shares. Trustees: I. Friedlander, J. Bensley, A. H. Ross, N. Luning, W. S. Chapman, J. Mora Moss and C. W. Howard.

SUBSCRIBERS should send former address, when ordering the paper sent to a new place. Returning a newspaper or blank slip, WITHOUT THE NAME and RESIDENCE of the subscriber is a thoughtless act, and useless both to subscriber and publisher.

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 76 William street, N. Y., or 16 Dearborn street, Chicago, Ill. 25v1-12mbp

LADIES DESIRING to procure a FIRST-CLASS SEWING Machine against small payments may apply to No. 294 Bowers, 157 E. 26th, 477 9th Ave., New York. Good work at high prices if desired. 21v1-12mbp

UNIVERSITY OF CALIFORNIA.—The Preparatory Department is under the charge of five Professors of the University and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-keeping are taught.

Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TAIT, Oakland, Master Fifth Class.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

SUCCESS IN BUSINESS.—Success in the business world usually depends upon being thoroughly prepared for its duties. Young men! if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24 Post street, San Francisco. This is the only school on the Pacific Coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book-keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which cannot be discussed here. Call at the College and examine its workings. If unable, send for circular, and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address E. P. HEALD, President, Business College, San Francisco, Cal. 10v23bp-3m

FOR COUGHS and THROAT DISORDERS, USE "Brown's Bronchial Troches," having proved their efficacy by a test of many years.

"I have never changed my mind respecting them from the first, excepting to think yet better of that which I began thinking well of."

REV. HENRY WARD BEECHER.

N. Seibert's Eureka Lubricators for steam cylinders are acknowledged by 150 engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not rust or gum, and will pay for themselves in a short time, in the saving of oil over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First street, San Francisco. 8v23-3m

Opera Glasses, Pebble Spectacles, and Eyeglasses, in great variety, wholesale and retail. C. MUELER, Optician, 205 Montgomery street, Russ Block, San Francisco. 7v23-3m

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoa, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma and a pure concentration of the purest elements of nutrition distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. fe23-ly

PSYCHOMANCY.—Any Lady or Gentleman can make \$1,000 a month, secure their own happiness and independence by reading Psychomancy, Fascination or Soul Charming, 400 pages. Full instructions to use this power over men or animals at will, how to Mesmerize, become Trance or Writing Mediums, Divination, Spiritualism, Alchemy, Philosophy of Omens, and Dreams, Brigham Young's Harem, Guide to Marriage, &c.; 200,000 sold. Sent by mail in cloth for \$1.25, paper covers, \$1.00. The Philadelphia Star speaking of the book says its author is HERBERT HAMILTON, B. A., the celebrated Psychological lecturer, and the publisher, T. W. EVANS, one of the oldest Perfumers and Publishers in the city, the mention of whose name is a sufficient guarantee of the merits of the work. MR. EVANS has spent \$50,000 already in advertising and getting out this extraordinary book. Skeptics in Psychology read and be convinced of this wonderful occult power.

NOTICE.—Any person willing to act as Agent will receive a sample copy FREE. As no capital is required, all desirous of genteel employment should send for the work, enclosing 10 cents for postage, to T. W. EVANS, 418 Eighth street, Philadelphia, Pa. ma4-lamst

### ACTIVE MEN!

The Great Equivalent.—The world may be safely challenged to produce so perfect a simulation of any thing in nature, as

Tarrant's Seltzer Aperient  
Is of its original, the Seltzer Spring of Germany. The Aperient, based on a correct analysis of the Seltzer Water, is even superior to the manufacture of Nature herself, because it contains all the active medicinal properties of the spring, unalloyed by any of the inert and useless particles found in all mineral fountains. THE GENUINE ARTICLE BEING SECURED, you have the Seltzer Water of Europe, purified and perfected, and probably the best, the most genial cathartic and antibilious preparation on the face of the earth.

SOLD BY ALL DRUGGISTS.

CHOLERA.  
HOW TO CURE IT.  
At the commencement of the Diarrhea, which always precedes an attack of the Cholera, take a teaspoonful of the Pain Killer in sugar and water (hot, if convenient), and then bathe freely the stomach and bowels with the Pain Killer, clear. Should the diarrhea or cramps continue, repeat the dose every ten or fifteen minutes until the patient is relieved. In extreme cases, two or more teaspoonfuls may be given at a dose.  
The Pain Killer, as an internal remedy, has no equal. In cases of Cholera, Summer Complaints, Dyspepsia, Dysentery, Asthma, it cures in one night, by taking it internally, and bathing with it freely. Its action is like nuxom, when externally applied to Old Sores, Burns, Scalds, and Sprains. For Sick Headache and Toothache, don't fail to try it. In short, it is a PAIN KILLER.  
Directions accompany each bottle.  
The Pain Killer is sold by all dealers in Medicines. Prices, 25 cents, 50 cents and \$1 per bottle.

RISK OF  
BOILER EXPLOSION EASILY AVOIDED  
BY USING  
EDSON'S

Steam Recording Gauges,  
which prompt a constant attention to duty, and are so secured by combination locks that they cannot be tampered with. These are the only gauges that afford a

CONTINUOUS RECORD  
of the fluctuations of steam pressure, and are therefore indispensable to all steam users, as well as absolutely necessary for the safety of the travelling public. The pressure is recorded on a movable chart. They are adopted by the U. S. Government, and required to be used on all steam vessels.

MADE SOLELY BY  
The Recording Steam Gauge Co. of N. Y.  
91 LIBERTY STREET, NEW YORK.

Manufacturers also of Superior Plain Indicating and Excessive Recording Gauges, particularly adapted for Locomotives. 10v23-1f

STEPHENS & CO.,  
MANUFACTURERS OF  
U. S. STANDARD BOXWOOD AND  
IVORY RULES.

ALSO EXCLUSIVE MANUFACTURERS OF  
L. C. Stephens' Patent Combination Rule.

This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, etc.

It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy. The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required. In its application as a Slope Level it is especially adapted for Miners' use, as it shows the PITCH to THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.

By the use of one of these, a builder, mason, carpenter, or other workman, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form. "Scientific American."  
Price by mail, prepaid, \$4. For agents' terms, address STEPHENS & CO.,  
Hartford, Conn. 9v10-23-3m

# Mining and Other Companies.

Owing to the time necessary to wait the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

**Alameda Coal Mining Company—San Francisco and Alameda Counties, State of California.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 17th day of September, 1871, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 409 Battery street (first floor), between Clay and Market streets. Any stock upon which said assessment shall remain unpaid on the 17th day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 30th day of October, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
M. PHILLIPS, Secretary.  
Office, 409 Battery street, San Francisco, Cal. se14w

**Bellevue Mining Company—Location of works, Ophir District, Placer County, California.**

Office, 409 California street (up stairs), San Francisco, California. au12-4w

## KNOWLES' PATENT STEAM PUMP.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.

The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.

The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rugs or a patent fibrous head, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purposes, are got at immediately without removing any nuts or bolts.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, CAL., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have sixteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other.

Yours truly,

A. J. STEVENS, General Master Mechanic.

OFFICE OF PEOPLE'S TRANSPORTATION CO., PORTLAND, OREGON, April 22, 1871.

Mr. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order per steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider them the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best Pump in use.

Yours respectfully,

G. MARSHALL, Chief Engineer.

OFFICE OF N. Y. CENTRAL R. R., ALBANY, June 3, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: Yours of 31st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.

Yours very truly,

C. P. HARM.

OFFICE OF DELAMATER IRON WORKS, New York, May 26, 1871.

Messrs. KNOWLES & SIBLEY, 92 and 94 Liberty street—Gentlemen: In reply to your inquiry as to your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.

Yours very truly

GEORGE M. REYNOLDS, Supt. Engineer.

U. S. NAVY YARD, New York, June 3, 1871.

Messrs. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.

Yours very respectfully,

WM. W. WOOD.

OFFICE OF THOMAS IRON WORKS, HOKENDATUA, Pa., June 1, 1871.

Messrs. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we have had in use now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, which to say the least are equal to the best we have tried. I cheerfully recommend "The Knowles Pump" to any who may have use for a first-rate Steam Pump.

Respectfully yours, etc.,

EDWIN MICKLEY, Supt. of Mines.

OFFICE OF THE SAUCON IRON CO., HELTERSTOWN, Northampton County, Pa., May 26, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: We can most cheerfully respond to your inquiry as to the quality of the Knowles Patent Steam Pumps we have in use. We bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnace and at the mines working in clear and muddy water, and have put them to severe tests. And we can say that they have given VERY GREAT satisfaction, and that we like them better than any we have ever used.

Yours very respectfully,

G. W. WHITAKER, President and Superintendent.

OFFICE OF NEW HAVEN WATER CO., Dec. 18, 1869.

Messrs. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 18-inch dia. steam cyl., 12-inch dia. water cyl., and 24-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of coal of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.

Yours very truly,

P. SAULT, Superintendent.

CENTRAL AND WESTERN PACIFIC AND CAL. AND OREGON RAILROADS, OFFICE SUPT. W. M. P. & M., SACRAMENTO, CAL., July 8, 1870.

A. L. FISH, Esq., San Francisco—Dear Sir: Your favor of the 2d inst. is received, asking my opinion in regard to the Knowles Steam Pump, and would say I have used the Knowles Steam Pump for several years, and consider them for all purposes the best steam pump in use. Yours truly, E. F. PERKINS, Supt. M. P. & M.

OFFICE OF RED BLUFF WATER WORKS, RED BLUFF, June 11, 1871.

A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working now four months, and has given entire satisfaction; and I take great pleasure in recommending them to all you have claimed for them, and I will add that I think they have no equal. Yours, etc., JOHN CLEMENTS, Engineer.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

A. L. FISH, Agent.

No 9 First Street, San Francisco, Cal.

P. S.—All kinds of new and second-hand Machines on hand.

24x22-60w

**North America Consolidated Mining Company—Location of works, White Pine Mining District, County of White Pine, State of Nevada.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 31st day of July, 1871, an assessment of Twenty (20) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the company's office, Room 5, No. 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Tuesday, September 5th, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 30th day of September, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. ## HUGHES' PATENT

## REMOVABLE GLOBE LANTERN.

Since the time when King Alfred made the first lantern by surrounding a candle with a transparent casing of horn, this class of appliances has been one of the greatest utility and most extended use. Among the latest improvements in its construction is that illustrated in the accompanying engravings, and designed to secure the threefold object of providing for the easy cleansing of the glass portion, the secure retention of the upper in place upon the lower part of the lantern, and the affixing of the hall to the top of the lantern in a durable and efficient manner. The base of the lantern is provided with the usual detachable lamp, and at one side has hinged to its upper edge a wire frame designed to carry and protect the glass portion or body of the lantern, and at the upper end of which is the cylindrical top, perforated in the ordinary manner to permit the escape of the products of combustion from the lamp. Arranged at that side of the base opposite the hinge is an angular spring-catch so applied as to catch over the annular lower rim of the wire frame, and in conjunction with the hinge, to hold the said frame firmly in place upon the base as required when the lantern is in use.

This Lantern is offered as

The Best and Most Desirable in Use.

all things considered. Its price is reasonable, and when once tried no other will be accepted.

Individuals, Dealers, Railroad Companies, and all persons and institutions about to purchase Lanterns, should inquire for this kind; and if not for sale in your locality, address the inventor for circular of full description, price list, etc.

Patented August 10 and December 28, 1869, by

Address 1811 Sidney street, East Birmingham, Pa.

## WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company gives a responsible guarantee that the purchaser shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Oam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and he all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation.

For further particulars address

FURMAN R. WILSON,

San Francisco.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION:—D, is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the ejection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. 1e18-tf

THE PATENT  
Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out standard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.

All kinds of CAR WHEELS, AXLES and RAILROAD WORK made to order. Standard sizes of Wheels constantly on hand. Wheels bored and pressed on, Axles turned, etc., at Reasonable Rates.

24v22-3m JOSEPH MOORE, Superintendent.

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings efficiently force the pulp directly under the mullers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation.  
15v20-1m.1amtf

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast, as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility having no cams, nor complex rotary arrangements to get out of order. Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having no dead points, it therefore needs no watching, and is consequently ready to start without using starting bar or any hand work whatever. The Blake Pump is extensively used on Railroads and Steamboats; in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Pump on Exhibition. The agents have recently imported several of the largest sized Mining Pumps for water works, and deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by BERRY & PLACE, Machinery Depot, 112 and 114 California st., San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.  
For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:  
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and sellers for themselves, at the office, 229 Fremont Street, San Francisco.

## PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON  
SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.  
The timber used is placed so directly in the line of strain, that less material is required to support the same load.  
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.  
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.  
Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.  
F. MALOON, Secretary.

W. H. GORRILL, President.

## Another Compliment.

Number 11.

## THE ROASTING OF ORES.

Whatever will facilitate the roasting of ores must be of interest to our mining readers, and we take pleasure in presenting the annexed engravings and descriptions of two furnaces for their especial benefit. The amount of refractory ores on different parts of this coast, renders the use of furnaces imperatively necessary, and special attention is at present being paid to this department of metallurgy. These engravings and their accompanying description are from the latest proof sheets of Mr. J. S. Phillips' work entitled the Explorers', Miners' and Metallurgists' Companion, which will shortly be issued by Dewey & Co. Fig. 1 represents what is called the

### Cornish Calciner.

"The ore is charged in a pulverized dry condition, through the hopper of funnel, H, after the furnace has been brought to a suitable temperature, which varies from low red, to red, and yellow red, according to the constitution and associates of the ore.

It is regulated in its travel from the centre both by the varying speed of the rotating hearth, worked by more or less water on the driving wheel, as well as by the stirring knives that can also be governed or varied from without.

It will be seen that it is being continually turned over in its passage from the centre outwards, until it falls over its periphery by way of a suitable lip to the receiving plat. Now it should be examined to prove if the roasting has been complete, by its smell, or by the other means usually resorted to.

The roasted ores should be deposited in a place where they can be soured in water whilst hot, to wash away the soluble matter, and extract more sulphur by the formation of sulphide of hydrogen, which can be readily known by its foul smell.

There is but one object for this roasting, which is the volatilization of the deleterious element, so that the gold may be released; but this must be effectually performed, and cannot be hurried beyond certain limits.

Roasting of Refractory Ores, Preparatory to Chlorination for Gold by Plattner's Process.

As the mines of this country are generally on the slopes of hills and mountains, I would suggest the arrangement of the reverberatory hand-furnace shown by Fig. 2, as a cheap and efficient roasting and chlorinating furnace.

It will be observed that steps and hearths are placed each higher than the other, so that the pulverized ore may be charged through the funnel to the upper one, for preparatory warmth; and being raked transversely through the side door, it will naturally descend over this inclined hearth, and ultimately fall through the heated air to the next of the series (or through the chlorine gas, when it is desirable to chlorinize for the subsequent extraction of silver by pan or chemical process). Under the foot of each sectional arch, there should be transverse arches, as shown by the descending lines beneath, for supporting the roof; and the whole should be firmly secured by external bolts, as shown. To suit less refractory ores, other funnels may be placed over each lower hearth, so as to use but one, or more, as required.

All of the bed part may be of fire-bricks, or fire-rock, if more easily obtained; or good common brick may be made to answer for the bridge, hearths, and roofs, as the heat is but moderate.

The foundation is cut in the side of a hill, of suitable shape for the hearths and ash-pit, and the draught is obtained by simply cutting and covering a trench up the slope of the hill, so that no other chimney is required. Catch-houses may be also excavated, when required for the arrestation and collection of the volatilized elements.

If there are no other advantages than

## Peace River Mines.—Caution.

The nature of the intelligence from this district is such as to discourage miners of any judgement, however nemadic their tastes and habits, from attempting the trip. The Montana papers all agree in dissuading prospectors from going, and furnish

Fig. I.

CORNISH ROTATING CALCINER.

that of warming the ore, as it lies on and falls from hearth to hearth, by otherwise wasted heat, it is considerable.

The ore should be charged in sufficient quantities as required, for being properly raked to fall at suitable speed through the

good and sufficient reasons for so doing, as there is nothing to warrant a general stampede to that cold region. Provisions are exorbitantly high; flour being 75c per lb.; beans, 90c; sugar, \$1.00; bacon, \$1.25

Fig. II.

HILLSIDE ROASTING REVERBERATORY FURNACE.

series, to suit the strength of ore, as governed by fuel and damper; and nothing but time and occasional stirring is necessary. The ores may be stirred on the upper inclined hearths by transverse rakes, as worked by machine motion, on bars that pass clear through both walls, to guide and carry the rakes across the furnace at their middles, so that the ore may fall down the incline after each motion."

TOBACCO grown in a cold climate, is stronger than that grown in a mild one, and a similar statement is true with regard to celery. So it appears from an article in the *Journal of the Pharmaceutical Society*, where it is maintained that in the less vigorous vegetation of cold climates, as compared with that of warm regions, the active principles of plants are more concentrated in the leaves.

to \$1.75; coffee, \$1.20; and other things in proportion, reminding one of the early days of California. In that respect a correspondent of the *Helena Herald*, writing from the Peace River mines, says: "There is no grass in the country, which is a swamp from one end to the other. There are about five hundred men here now, but they are leaving faster than others come. I met two hundred going away in one party the day I arrived, and I think if something is not struck shortly the camp will be deserted. A man cannot get a days work here for love or money." We would caution all those contemplating a trip to this new "excitement" to be patient, await developments, and profit by the lessons of former years, rather than risking their means and health by starting off to this cold and destitute section of country, where nothing can be gained but poverty and suffering.

## The Mining Report for 1871.

Mr. R. W. Raymond, U. S. Commissioner of Mining Statistics, being desirous of collecting for his next annual report, as much reliable information as possible, has sent circulars to superintendents of different mines, and to mining men in general; but strange to say, he finds serious difficulty in getting the desired information. Mr. R. says in his last report, that so far as the blanks were concerned,—the result was a great disappointment to him; but to the credit of the State, however, it is remarked that the fullest returns received were from California. The appropriation for the purpose of gathering statistics and other information for this report is quite inadequate to the end desired; and Mr. Raymond is necessarily compelled to ask assistance from those directly interested in the matter of getting reliable information.

The answers to these circulars are considered not only as a contribution on behalf of the mining interests, but also as an official and personal favor to Mr. Raymond. The queries are simple and brief, and such as would not take a person familiar with any particular locality, from which statistics are required, more than half an hour to prepare a few notes that would be very valuable for this report. The report itself will not be issued before April, 1872, and anything that may be marked as confidential will not be made public in any form, before it is published in the report.

Superintendents, mill owners, foremen, and prominent men, known to be interested in mining, who receive these circulars should comply with Mr. R.'s courteous request and assist him in his labor. We earnestly exhort parties who may receive the notice spoken of to answer it without delay, and add their mite to the general knowledge concerning the progress and condition of the mining industry in the Rocky Mountains, the Inland Basin, and the Pacific Slope. All communications from this State should be addressed to Mr. W. A. Skidmore, P. O. Box 1,513, San Francisco. This gentleman is acting as Mr. Raymond's deputy, and will be thankful for whatever favors he may receive in this connection.

THE "CHRONOPHER" is the name of an instrument which has been devised in England, to furnish correct time to places at a distance. It is proposed, by the use of this instrument—which will be stationed at the Greenwich Observatory, to flash from thence the true time, once a day, to all the principal cities in Europe, and to every post-office in England. Time guns will also be fired, bells struck, and balls dropped by the same current, at different and distant stations. Who says that the present generation takes no note of time?

A similar system to note and register the moment of earthquake movements in different parts of California would be more important than any advantages of the practice elsewhere.

## MECHANICAL PROGRESS.

### The Preparation of Fancy Soaps.

Fancy soaps, which are made in great variety for the toilet, are usually scented with some aromatic oils. For this branch of the trade the ordinary commercial soaps are used, after undergoing a process of refinement; or a soap is specially made for the purpose from almond oil, or the like. Much taste is shown by the best London makers in the selection and combination of the perfumes, which, along with the coloring matter, such as vermilion, yellow ochre, aniline, etc., are usually boiled up with the soap. To facilitate this operation, as a well dried soap does not readily melt, it is usually cut up into fine shavings, and after boiling is well worked under rollers until it presents a uniform appearance. If the soap is intended to be highly scented, or very extensive perfumes are to be employed, the cold process is adopted, as much of the strength of the scent is lost by boiling. In this case the soap is shredded as before, and the perfume and coloring matters well amalgamated with it by being worked in a mortar with a pestle. It is then divided into lumps, and roughly molded with the hand into something of the shape it is finally to assume. After being left on a rack to dry for about a week, it is pressed into a mold, which imparts to the cake the form and device which may be required, and when taken out, the edges are trimmed and the surface polished with the hand.—*Scientific American*.

### The Microscope for Testing Steel.

According to the experiments made by Mr. John Schott, the eminent chemist, the different qualities of iron and steel can readily be distinguished by means of the microscope. Thus, the crystals of iron are double pyramids, in which the proportion of axes to the bases varies with the quality of the iron. The smallness of the crystals and the height of the pyramids composing each element are in proportion to the quality and density of the metal, which are seen also in the fineness of the surface. As the proportion of carbon diminishes in the steel, the pyramids have so much the less height. In pig iron and the lower qualities of hard steel, the crystals approach more closely the cubic form. Forged iron has its pyramids flattened and reduced to superposed parallel leaves whose structure constitutes what is called the "nerve" of the steel. The best quality of steel has all its crystals disposed to parallel lines, each crystal filling the interstices between the angles of those adjoining. These crystals have their axes in the direction of the percussion which they undergo in the working. Practically good steel examined under the microscope has the appearance of large groups of beautiful crystals, similar to points of needles, all parallel and disposed in the same direction.

**NEW ATMOSPHERIC BRAKE.**—The Pittsburgh and Connellsville Railroad Company have been trying a new air brake, called the Smith patent, and claimed to be a better one than any now in use. This apparatus it is asserted, can stop in a few seconds a train of cars at full speed. At a recent trial on the Missouri Pacific Railroad, a train 300 feet long, traveling at a speed of 34 miles an hour, was stopped in 20 seconds, and at a distance of 1,000 feet from the point where the brake was applied. The train traveling at the same rate was subsequently stopped by brakemen with a hand brake; but 45 seconds were required and the cars continued in motion for 1,750 feet.

**TO PREVENT BOILER EXPLOSIONS.**—The record of English patents shows one designed to prevent explosions of steam boilers, which may be worth notice. This device consists in providing a hole in the upper part of the boiler, and covering the same with a material (India-rubber for example) of sufficient strength to withstand ordinary pressures, but which will give way and allow of the escape of steam under excessive pressure. The India-rubber is clamped to the boiler by a flanged tube formed for the purpose.

**A NEW BRASS SOLDER.**—A new brass has been devised, having its expansion and contraction by changes of temperature the same as those of iron or steel, or so nearly so, that it may be used to solder those metals to brass. Its composition is: tin, 3 parts; copper, 39½ parts; zinc, 7½ parts.

### Hardening Rails.

Want of room at Demitoff's rail mill, at Salda Nischne, caused some years ago, a lot of red-hot rails to be removed to outside of the building where the ground was covered with snow, when it was found that the iron had been wonderfully hardened by the sudden cooling process it had undergone. A government commission, by careful examination, satisfied itself on this point, and since that time all the Russian mills have adopted the plan of suddenly cooling the rails by means of water. The rails are plunged into cold water immediately on leaving the saws, except at the works of Von Patilow, near St. Petersburg, where rails with heads of mild puddled steel are allowed to cool sufficiently to lose their luminosity before receiving the cold bath. Rails so treated are found to be perfectly reliable in the severe winters of Russia, so that there can be no question of their service in other and less rigorous climates. "The degree of fracture in good hardened rails depends," says a cotemporary, "obviously on the degree of hardness, and this depends not only on the amount of carbon present in steely irons, but on the temperature at which the hardening is effected; and there can scarcely be any tenable ground why rails should not be hardened while any other articles are, in which fracture is equally to be feared. The hardening effected by sudden cooling is indisputably less dangerous than that imparted by phosphorus; and, in case of iron free from impurities, when we compare rails hardened on the one hand by the addition of carbon, (approaching steel in composition) and on the other by sudden cooling, the advantage of safety would undoubtedly be in favor of the latter—to say nothing of the expense of manufacture."

**A NEW PREPARATION OF INDIA RUBBER.**—An improved preparation of rubber has lately been invented at Providence, R. I., which seems to supply an important want. This preparation is for carriage washers, gaskets, belting, and other purposes, where rubber comes in contact with oil, so prepared that the oil will not affect the prepared rubber. The invention consists in combining clay with vulcanized rubber. The clay which is preferably used, contains by analysis about thirty-nine per cent. of alumina, forty-six per cent. of silica, thirteen per cent. of water, and about two per cent., or a mere trace of iron, magnesia, and lime. An appreciable quantity of these last mentioned substances would defeat the object in view, since they would lump and form a gritty surface, and their particles would not contract with sufficient closeness to exclude oil. In preparing the rubber the clay is mixed with the caoutchouc and sulphur, which mixture is then prepared and vulcanized in the ordinary manner, according to the particular use to which it is to be applied. Plumbago may be added to the mixture, or not, according to the use which the rubber is to be applied. For carriage washers the compound is vulcanized upon an arbor, and washers of the desired thickness are afterward cut off.

**EXTRAORDINARY RAILROAD IRON.**—The *Montreal Gazette* states that the Canadian Grand Trunk Railway has received from England samples of steel for rails and axles which will challenge comparison with any material ever made for these purposes. "A rail was twisted cold 13 times before fracturing, in the shape of a spiral spring; and the fracture indicated that the metal still retained its hardness, toughness, and malleability. An axle was bent cold in a testing machine, with a pressure of 2 tons at 3 ft. 6 in. bearings, into a complete knot without any fracture whatever." Other remarkable samples are reported.

**A SINGLE-RAIL TRAMWAY** has lately been put into operation in India. The cars have four ordinary wheels, placed as usual, and two others, double flanged, placed between the fore and hind wheels which take the weight of the car and load, and run upon a single-rail in the center of the road track. The ordinary wheels serve to merely balance the car. The road costs but about one-half as much as the ordinary railing, while the power required for draft is vastly less than on common roads.

**CASTING UNDER PRESSURE.**—The casting of car wheels under pressure, has for some time been in progress at the Fairhaven, (Mass.) Iron Works. It is claimed that decided advantages are obtained by this mode of casting.

## SCIENTIFIC PROGRESS.

**PSYCHIC FORCE.**—It is proposed by Mr. Cox, one of the witnesses of the experiments with the "medium" Home, conducted at the house of Mr. Crookes, in London, that a psychological society shall be established for the investigation of the newly acknowledged force—in other words that a new branch of technology should be instituted out of this class of phenomena.

So far as yet developed this force does not appear to be accorded to every one—and is not uniform in its manifestations even to those who possess it in the highest degree yet noticed—a fact which must seriously interfere with any extended utilization of the miraculous power of setting at naught the laws of Nature. Hence we can hardly look to the possible construction of a psychic engine as a substitute for steam.

Still, if no other benefit should be derived from the investigation than the overthrow of the absurd theory that the peculiar developments noticed have their origin in the antics of departed spirits, the rational world will be placed under lasting obligations for that alone.

**FURNACE TEMPERATURES.**—The difficulty of determining high temperatures, as in furnaces, is well known; while the importance of being able to do so more closely than is now possible is universally acknowledged. Mr. C. W. Siemens, a gentleman well known in connection with improvements in furnaces, proposes to make use, in this connection, of the well known fact of the increase of electrical resistance in conductors with the rise of temperature. He has devised a very simple instrument for measuring the resistances, without the aid of the magnetic needle or resistance scales; and has tested his methods with very satisfactory results. He recently presented a paper on the subject before the British Royal Society.

**A NEW ALKALOID FROM CINCHONA BARK.**—David Howard communicates to the *Journal of the Chemical Society*, London, the fact that he has discovered a new alkaloid, hitherto undescribed, in Cinchona bark. It was detected in the mother-liquor, while re-crystallizing quinine sulphate. This alkaloid appears as a yellowish oil, decomposing only when heated, and not losing its water in vacuo. It is soluble in either alcohol or ether. It is more strongly alkaline than quinine, and at the same time is less bitter than any other cinchona alkaloid. Experiments are being made to determine from what portion of the bark it proceeds.

**TESTING THE QUALITY OF METALS AND ALLOYS.**—P. Bischoff of Bonn has proposed a new method of testing the quality of ductile metals and alloys, which, with the description of the apparatus required, is described in Dinger's *Polytechnic Journal*. If different kinds of metals or alloys have been rolled in exactly the same manner, the difference of ductility between them may be readily determined by the difference in the number of times the metal can be bent to and fro; under precisely the same circumstances, chemical analysis can only ascertain the presence or absence of certain impurities, without showing the injurious effect such impurities may have upon the metal. M. Bischoff has devised machinery which acts uniformly in both rolling and bending, and claims that the relative number of bends, when made by such machinery, determines not only the tenacity and strength of the metal, but its ductility and softness as well.

**ORIGIN OF PETROLEUM.**—A prominent German scientific journal contains a labored review of the various theories of the formation of petroleum, read before the Swiss Association of Natural History, in which many objections are raised against the theory of the production of that fluid from the remains of either animals or plants. A mineral origin is suggested.

### Oxygen from the Atmosphere.

The economical preparation of oxygen gas on a large scale, for use in the arts, has long attracted the attention of chemists, and several ingenious suggestions have been made looking to a solution of the difficulty, among the most recent of which is the one by Mallet, in Paris, who has devised a plan for obtaining this gas from the atmosphere by taking advantage of the greater solubility of nitrogen in water than oxygen. If the air be passed through water, more of the nitrogen is absorbed than oxygen; and it is only necessary to repeat this operation a number of times to arrive at an atmosphere from which nearly all of the nitrogen has been eliminated. It is difficult, without the aid of wood cuts, to convey an idea of the apparatus which has been constructed for accomplishing this result, but it is chiefly composed of a series of cylinders, to each of which is attached a force pump for driving in the air and passing it from one vessel to another. The moment the pressure is removed from the water, the gas escapes just as it does from a soda fountain.

It is found by actual experiment that after forcing the air through eight cylinders not more than three per cent. of nitrogen remains, an amount which may be disregarded for all practical purposes. The chief item of cost is in the working of pumps, which cannot be much, as the pressure would not have to be very great.

From the simplicity of the method we should not be surprised if Mallet's process should soon take precedence over all others. The need of a cheap method of producing oxygen has long been felt, and it appears as though the process for obtaining it here alluded to, might meet a large number of cases.

There are many metallurgical operations in which powerful blasts of air are employed to increase the force of combustion, where experiments ought to be instituted to ascertain if that quantity of oxygen could not be increased by the intervention of a drum or some kind of receiver for water. If this could be done without interfering with the requisite supply of air, it is probable that greater heat, with a large saving of fuel would be the result.

**A SPONTANEOUS EXPLOSIVE.**—Some experiments recently conducted at the Philadelphia High School developed the fact that when a strong solution of phosphorus in bisulphide of carbon is poured upon finely powdered chlorate of potassa, resting on paper, and the mixture is exposed to air, upon the evaporation of the bisulphide of carbon, the phosphorus being left in a very finely divided state, intimately mixed with the chlorate of potassa, the mixture presently explodes spontaneously, with a loud detonation. The explosion in this instance is analogous to the case of phosphorus and chlorate of potassa when struck or rubbed together, the mixture of the two substances in the present case being, however, much more perfect than can be obtained by any mechanical means.

**GREEN OF LEAVES.**—J. J. Muller, who has been examining into the nature of the coloring matter of leaves, states that on directing a spectroscope to the under side of a leaf, on the upper side of which the sun was shining, he observed a spectrum entirely distinct from that which characterizes chlorophyll. The inference drawn is that the green of leaves is not leaf-green or chlorophyll, as heretofore supposed. No opinion is given of what it may be.

**OXIDATION OF AMMONIA.**—To exhibit the rapid oxidation of ammonia, Hoffman puts a tuft of platinized asbestos in the middle of a combustion tube, places red litmus paper before and blue paper behind it, and conducts a current of air impregnated with ammonia over the heated point. The formation of nitrates and nitrites is immediately shown by the reddening of the blue litmus paper, and in the cool part of the tube, white fumes of salts are deposited. If the operation be continued for some time it is easy to fill a flask with the ammoniacal nitrates.

**BRISMITH.**—This metal comes principally from Saxony, and sells at a very high price. It is, however, reported; that hismith has been discovered at Balhannah, in South Australia, where extensive smelting works have been erected for extracting the metal from the ore.

## CORRESPONDENCE.

### EAST CANON, OPHIR DISTRICT, U. T.

BY OUR OWN TRAVELER.

EDS. PRESS:—Leaving the City of the Saints and taking my place on one of the fine 6-horse line of stages belonging to Wines & Kimball, we ride along near a range of mountains known as the Oquirrh, passing the Lake and at 1 p. m. reach Rush valley. Shortly after leaving here the road winds up East Cañon for about two miles, to the city of Ophir, 56 miles from Salt Lake. This cañon was visited in 1864 by U. S. soldiers, who made a few locations; but failed to do much work in them, as they did not consider the base ores of any value. In June 1870 a small number of energetic miners from White Pine came to look at the country and prospect for quartz. Since that time Ophir City has sprung into existence, and now contains a population of nearly 1,000 souls, several stores, saloons, etc., a good school, and a saw mill. On the road up the cañon I noticed a quartz mill and two smelting furnaces in operation. To the South of Ophir City is Lion Mountain, the summit of which is reached either by going the road from the town, about two miles long, or by way of Walker's mill, there being a good road from there for the purpose of bringing ore to the mill.

The largest lodes on the hill are the Mt. Lion, Mt. Tiger, Sunnyside, Silver, Exchange, White Star, and Silver Chief. The first one I visited was the

#### Mount Tiger,

owned by Walker & Co. The tunnel on this ledge is 6 feet wide and 175 feet long. The foreman, Mr. Daly, informs me that the ore will assay on an average \$200 per ton in silver. There are 400 tons now on the dump, and 10 men are employed in getting out ore. Passing by the Zella shaft the next mine that attracts attention is the

#### Silver Chief,

a very old location on the hill, owned by W. T. Barbee and others. Ore has been worked from this claim that yielded by smelting process, \$226 per ton. There are now 150 tons of carbonates and chlorides on the dump. The tunnel follows the ledge in for a distance of 135 feet, and it is thought the ore will yield from \$125 to \$150 per ton. The bench in front of the openings to the mine, has been dressed down in front of the ledge a distance of 150 feet, showing chloride veins the whole way. At the end of the main tunnel is a drift to the northward 40 feet long. The

#### Silver Exchange,

owned by Phillips & Co., has 800 sacks of ore on the dump, and employ 12 men. The

#### Mount Lion

is a large ledge, located in August, 1870, and belonging to O. E. Bates. There are three shafts in this mine, the main one being 35 feet deep, and showing a fine body of ore nearly eight feet in width, which runs northeast and southwest. They have 300 tons of ore on the dump, and I was told by the foreman, Mr. Knapp, that 20 tons shipped to the reduction works yielded \$500 net. This is one of the best mines in the district. Near by is a cave which was struck by some parties while prospecting. They run in a tunnel 25 feet, and at the end opened into this cave, which is all the way from 2 to 20 feet in height and 20 wide. Small streaks of chloride ore averaging from 1½ to 6 inches in width, and fine specimens of atacamite are to be seen. It is thought that a large deposit of ore is under the cave, and that gradual decomposition has let this body of lime-rock down to its present position. The Superintendent, Mr. Evans, is now sinking a shaft to determine this question. On South Ophir or Silveropolis Hill is the

#### Occidental Mine,

located in August, 1870. The tunnel on this ledge is in 60 feet, and they have taken out 150 tons of ore, which is now lying on the dump. A sample lot worked by the Stetefeldt process at Reno, on the line of the C. P. R. R., yielded \$230 per ton. The ore is hard chloride, and is, as may be supposed, in limestone formation. There are 12 men at work on this mine.

#### The Tampico

has five men employed in sinking the shaft which is 32 feet deep, showing an aver-

age width of two feet in the body of ore. Semo horn silver has been found in this claim and the chloride runs about \$75 per ton. Mr. Jas. Crossley is supt. Leaving here we went to the

#### Silveropolis Mine,

where they have 400 tons of ore on the dump, sample lots of which have worked \$95 per ton.

#### The Chloride Point

has a tunnel on milling rock, 170 feet in length, running due north. Capt. Balch, the Supt., tells me that there are 250 tons of ore on the dump ready to be worked. At Silver Hill, on the north side of the cañon, is the

#### Velocipede, No. 1,

near the city, and located in Nov. 1870. The tunnel on this ledge is in 100 feet, and the drifts, on both sides, all in a body of ore. This is principally carbonate of lead, and is said to work easily, yielding from \$45 to \$50 per ton in silver. It is thought by the managers of the smelting works in the Cañon below. The rock being soft and decomposed is easily mined, and Mr. Manchester, the Supt., tells me that there are upwards of 1,000 tons on the dumps.

#### Velocipede, No. 2,

has considerable ore on the dumps, and has a tunnel 75 feet in length, giving evidence of a large deposit. The shaft is only 12 feet deep.

#### Silver Shield.

The main tunnel of this mine is 65 feet in length, at the end of which is a shaft 36 feet deep, passing through a fine looking body of ore. The wide drifts east and west are respectively 75 and 50 feet in length. The body of ore dips to the west, and averages, it is said, \$33 per ton in silver by smelting. There 8 men employed and they have 1,200 sacks of ore on the dump. This mine is quite extensive and belongs to Judge McKean, R. M. Robinson, Col. Kane and others. T. J. Smith is Superintendent.

#### The Chrysopolis Tunnel

has been run in 42 feet, a short distance up the hill, and the company have good indications of ore. Messrs. Riley & Rafferty are the owners.

The Velocipede No. 1, Velocipede No. 2, and Silver Shield mines, have been connected by side drifts, all three of these locations being close together. The deposit of ore on this hill is considered to be fully as large as that of the "Emma," but it is not so rich in silver. Work is being carried on energetically in all these mines. I understand that there are many good locations scattered about higher up the hill, but for want of time I did not visit them. There are a great number of prospectors at work in this vicinity, and we hear of new strikes quite frequently. The enterprise of tunneling the mountain, from the north side of Lion Hill to the south side of Horn Silver Hill, is exciting attention just now. A company has been formed with an incorporated capital of \$2,000,000, for this purpose. The locators in this enterprise are Messrs. T. G. McLaren, T. F. Tracy, J. C. Mathews and others. McLaren's East Cañon tunnel has been surveyed, and along the line the prominent altitudes above tide are as follows: East Cañon Gulch, just above Ophir, 6,670 feet; "Silver Chief" mine, 8,500; "Mt. Tiger" and "Zella" mines, 8,650; summit of Lion Hill, 9,100; "Mt. Lion" mine, 8,620; Mountain View House, Monarch and Virginia mines, 8,776; summit of Horn Silver Hill, 9,215; Vallejo and Occidental mines, 8,850.

Another tunnel company is talked of through Chloride Hill. It will tap the base of a number of mines, among them the "San Joaquin," "Chloride Gem," "Chloride Queen" and "Anna." These tunnel projects will be of great utility to the entire district.

A careful estimate places the amount of ore now lying on the dump of mines on Lion Hill alone, at 6,000 tons, awaiting the completion of the mills. A large number of excellent mines are now idle waiting for the erection of reduction works.

The mines on Lion Hill are very extensive and are more fully developed than at any other place in the district. The mines containing the base ore, or argentiferous lead in its various forms, are principally on the North side of East Cañon for a distance of three miles. There have been found also chloride ores of a high grade, in many places, in this base metal range, from the summit to the foothills. Among the ledges which bear chloride ores and are at the same time in the vicinity of those carrying base metal, are the Baltic, Lowland Chief, Naboh, Olive Branch, Eastern Star, Great Western, Chrysopolis,

Albion, San Joaquin, Alabama, Kearsarge, and Chloride Gem.

These ores although called free, will probably require roasting to perfect amalgamation in milling, since they all contain a small percentage of base matter, in the forms of antimony, lead, sulphur, arsenic, and copper. The smelting ores are principally in the form of galena, carrying on an average about \$60 per ton in silver. The carbonates yield \$40 per ton in silver on an average and 45 per cent. lead. The latter class of ore will have to be concentrated and freed from earthy matter before shipment for smelting. The grade of ores of this nature taken out thus far is too low to ship with profit, at present rates of freight, to the East or West, and the method of working ore which will approximate the fire assay the nearest is what is desired in this, as in every other district containing base metal ores. With an abundance of such ores as are now being taken out, the necessary fluxes (which are abundant) and a sufficient knowledge of metallurgy to treat them right at the furnace, the smelting business intelligently and economically managed must be very profitable in Ophir district.

So far as experiments have gone they have shown that the ores of Lion and Silver Hills will have to be roasted before amalgamating, for the reasons before mentioned. Good mills with furnaces attached can afford to pay a good figure for ores, as their process is much more perfect than the furnaces alone are, the latter being a comparatively new thing in the separation of silver ores in the interior, and the reputation of the process has suffered from the inexperience of those conducting it. It is improving, however, and bids fair at no distant day to compete favorably with any other process.

### THE SAN DIEGO MINES.

#### Julian District.

EDS. PRESS:—In your issue of Aug. 19, a correspondent signing himself "T. T." criticizes my communication of July 20, concerning the yield of ore from the California mine. I thank you for your explanatory note, under his letter, in which you give an intelligent interpretation of the idea that I intended to convey. The rock from the California mine that I spoke of in my letter, (published in your issue of the 5th,) was extra ore and might be called a specimen; although they did have some that was pounded in a hand-mortar and yielded as high as \$5 per pound. Mr. D. H. Snyder & Co. have succeeded in straightening the California shaft, and, having timbered it in a substantial manner, are now sinking. There is no doubt but that they have a very fine mine. In my last letter I told you I would tell you something more in my next with regard to A. P. Frary's mine, the "Stonewall," it was then 12 feet wide. The ledge has enlarged until it is now about 15 feet wide between the walls. All the rock will pay, and is extracted without the aid of powder. Heretofore there has only been sufficient water obtained from the mine to run the mill about three hours; but since they have commenced sinking the shaft, water has increased daily, and now they can run the mill 10 hours per day and will soon have sufficient quantity to run all the time. When the mill runs, (five stamps,) it pays or cleans up \$20 per hour. In short, the Captain has one of the finest mines in California.

Our country is not prospected yet, and prospectors are still making strikes. Mr. W. G. Woodward, who found and located the California mine, having last week sold his entire interest in that mine (to D. H. Snyder & Co. whereby they became sole owners of the mine,) started out prospecting, and was soon rewarded by finding a ledge within a few hundred yards of the Owen's mine, and running parallel with it, which he informed me was nearly two feet wide and the best prospect he ever found in the country. From a specimen he showed me, showing free gold, I should pronounce it very rich. Mr. L. L. Wilcox, also found a ledge last week, a large specimen of which showing plenty of free gold, he left in my office. He says the ledge is about one foot wide. There are many old locations here that prospect gold that are lying idle; but we hope these mines will all soon be worked, as the mills are doing

better than formerly, proving that mines that have not been remunerative heretofore, can now be worked with a profit. Messrs. Gunn and Reynolds' mill has been running steadily, and shows great improvement in returns on ore. Parsons & Moore made a sale last week of their mill to Col. Wm. R. DeFrees & Co. who will soon start up with a new engine and proceed to add new machinery for working ore and saving gold. Col. DeFrees being an old "Idaho mill-man" will no doubt make the mill a success. The mines in San Felipe are all looking well, particularly the Kentuck, Madden, Antelope, Redman, Bailoy, and Golden Chariot,—ore from the latter mine is now being delivered at McMechan's mill, which is estimated at \$200 per ton. We only need more capital to prove how numerous and rich our mines are. Last week one-half the Madden mine was sold for a pittance, and this week a specimen was shown me from the bottom of the shaft 40 feet deep, with free gold all over it. In the sinking of the shaft some very rich rock has been found, a specimen of which I sent to the Mechanic's Fair, which was noticed by you in your issue of 19th.

L. B. H.

Julian City, Ang. 28th, 1871.

### Agriculture in the Mountains.

We learn from our exchanges that the crops throughout the mountains of our own and the adjoining states of Nevada and Oregon and the surrounding Territories, as well, are all that could be expected, even under the most favorable circumstances. Experience is fast demonstrating the fact that our mining regions may place themselves almost independent of the great valleys of this State for their agricultural supplies. Still, but very few of the fertile valleys in Idaho, Montana, Colorado and Utah, are under cultivation. Enough, however, has been done to show most unexpected and satisfactory possibilities in the more extensive and careful cultivation which will yet be reached. The streams running through these valleys, as a general thing, are large, never failing, and furnish an abundance of water for irrigation; and while the low lands will be generally devoted to fruit and root crops, that farther back and among the foot-hills is well adapted to grain of all descriptions, and still farther among the hills is found good grazing ranges for stock.

Such lands are becoming each year more and more valuable, as their capacities for cultivation are more generally made known. Fine root crops are being raised on such lands in Colorado even at an elevation of eight and ten thousand feet above the sea level. These facts have an especial interest to our mining population, which will thereby soon be enabled to secure the most of their supplies near home, and consequently at a greatly reduced cost, by means of the saving of transportation. But a small proportion of such lands, susceptible of improvement, have as yet been taken up, and thousands of acres in every mountain county this side of, and including Colorado, are yet open for location.

Practical experience has taught us that sage brush land, hitherto considered absolutely worthless to the farmer, is the very best kind of land for cereals, wherever it can be irrigated. Bright prospects are before all our mining counties, if they will only utilize, with diversified industries, all the advantages which they possess.

### A Handsome Acknowledgment.

MESSRS. DEWEY & Co.: We hereby acknowledge the receipt of the patent papers for our improvement in wheels for traction engines, and also the notice that the improvement on tubular boilers had been allowed; and in this connection we think we should exchange congratulations for the uniform success that has attended your applications for us, this being the twelfth patent we have obtained through your agency, within ten months, for our American Overland Steamer—a success due to the careful and full preparation of the cases before they leave your office, and a thoroughly live man to attend to them when they arrive in Washington; and perhaps we might modestly add, the intrinsic merits and originality of the ideas themselves. Such promptness and success in obtaining patents we think unparalleled.

Respectfully yours, O. HYDE & SON.  
Oakland, August 1, 1871.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

TARSHISH.—Monitor *Miner*, Sept. 2d: The Silver Glimpse, Monitor No. 3, and Schenectady, continue to encounter pay ore at widely different points, proving the lode a very extensive one.

Six more carpenters, making thirteen in all, are to be put at work on the new quartz mill, Main St. It is said that the mill will be running by the first of December.

### CALAVERAS COUNTY.

FOUND IT.—Mok. Hill *Chronicle*, Sept. 9th: Champion & Co., Corral Flat miners, have struck a rich streak. A piece of gravel large as a man's fist, taken from the lead yielded \$10.

MINING ACCIDENT.—On Wednesday C. O'Neil, in the Whiskey Slide Mine, received quite severe injuries by being caved upon. His left leg was dislocated at the knee by the mass of falling quartz, and he also sustained severe bruises.

### LOS ANGELES COUNTY.

BULLION.—Los Angeles *News*, Sept. 6th: 500 bars of bullion from the Union works, Cerro Gordo, were received at the depot yesterday; and 500 from same place on the 8th; aggregate weight 42,308 lbs.

### MARIPOSA COUNTY.

MILL DESTROYED.—Mariposa *Gazette*, Sept. 8th: Fileciana quartz mill was totally destroyed by fire on Wednesday of last week. The mill was a ten-stamper. It is the intention of the Co., to erect a new one immediately.

### MONTEREY COUNTY.

NEW QUICKSILVER MINE.—Monterey, Sept. 8th: We report the discovery of a quicksilver mine, which promises to take rank with that of New Idria in richness. It is called the Cerro Bonito mine, lying in the mountains west of Panoche Valley, about 50 miles from San Juan. A 5-ft. ledge has been laid open, and about 200 tons of metal taken out, averaging 10 per cent. of quicksilver. Specimens of the ore, yield 45 per cent.

### NEVADA COUNTY.

IDAHO MINE.—G. V. *Union*, Sept. 8th: Has been running with regular and large results for several months. The dividend for August last was \$10 per share, or \$31,000 as the whole.

NEW YORK HILL MINE.—Fine looking rock is now being taken out of this mine. The ledge is a good one and the rock is heavily charged with mineral. Work is being actively prosecuted.

ACCIDENT AT THE EUREKA MINE.—On Monday, W. Harris was working on a scaffold, when he slipped and fell a distance of 8 ft. An axe on the scaffold fell at the same time and struck Harris on the back of the head, making a fearful gash.

### EL DORADO COUNTY.

GREAT CREVICE MINE.—Sac. *Reporter*, Sept. 8th: The men are making a tube of iron which measures 5 ft. clear on the inside, and expect to have it down 90 ft. in about 16 days, when they will probably strike pay dirt.

FIRE—MILL BURNED.—Same, Sept. 12th: Sunday about 2 o'clock A. M. the Dartmouth Co.'s mill was destroyed by fire. It is supposed it to be the work of an incendiary. The property was worth about \$5,000 and we know of no insurance upon it. The mill was a new one and had never been used.

MINING ITEMS.—Yesterday the Enterprise M. Co. Buena Vista Hill struck into gravel, 7 feet thick. It is closely cemented and is rich in gold.

The Coe mine is looking very well. The ledge in the bottom of the shaft is about 6 feet thick and shows free gold. It is nearly vertical.

The Empire mine is doing well, sending to the surface very rich rock.

The North Star is in a dividend paying way.

The Kentucky ledge east of the town on Wolf creek, has been recently sold to parties in S. F. for \$25,000.

The Webster gravel mine on Randolph Hill, is paying over expenses, and the quality of the gravel is increasing every day.

The Altona on Alta Hill has good prospects in gravel.

### PLUMAS COUNTY.

ARGENTINE.—Quincy *National*, Sept. 9th: The Conklin mill has commenced crushing again, Mr. C. having recently put in a new battery. He will operate by wet crushing, instead of dry as formerly. The

rock prospects well. Lowe & Hobart's mill is running steadily, and paying first rate. Heath & Freeman's placer claim is paying at the rate of \$20 a day to the hand.

## Nevada.

### COPE DISTRICT.

ORE SHIPMENT.—Elko *Independent*, Sept. 9th: A. J. Roulstone, during the week, shipped 30 tons of ore from Railroad Dist. to S. F.

BULLION.—Ten bars of hullion were brought from Mt. City during the week, valued at \$9,000.

PROSPECTING PARTY.—On Wednesday evening, 12 men left for Eastern Wyoming, in search of placer diggings.

### EUREKA DISTRICT.

BULLION.—Eureka *Sentinel*, Sept. 3d: The Consolidated Co. is making about 22 tons of hullion per day. The Phenix Co. 10 tons. The Richmond Co. 10 tons, and the Roslin furnace 10 tons.

GENERAL LEE MINE.—Yesterday another rich discovery was made in the "Mary Belle" location. This demonstrates the fact of the unbroken extent of the General Lee vein across the ravine and some 150 ft. further southwest.

GOOD STRIKE.—The miners in the Excelsior, New York cañon, yesterday struck a fine body of ore, averaging a higher grade than any before found in the mine.

DISCOVERY.—On the road to Austin, and about 10 miles from Eureka, is a place named the Devil's Gate. A large and well defined ledge has been discovered there, extending for a long distance.

SOLD.—The Wide West mine was sold yesterday for \$25,000; \$80,000 was refused by the owners of the General Lee for that mine.

NEW FURNACE.—The Richmond M. Co. have commenced excavating for the site of two furnaces to be built immediately.

PINTO MILL.—The grading for the foundation has been completed.

NEW YORK CANYON.—The Gaslight shows a fine body of first-class ore 3 ft. thick. This mine is for sale. In Excelsior the prospectors have opened a large body of ore. The X. Y. Z. is being developed rapidly, and shows a fine vein. The Fourth of July is improving. The Home Ticket, is being profitably developed, and has ore in abundance. In the Lord Nelson, ore of good quality was struck in a regular vein on Saturday. The Diamond has a good vein just opened. In the Elise, ore was struck in the main tunnel at 100 ft. from the surface.

### ELY DISTRICT.

MONTHLY SHIPMENTS.—Pioche *Record*, Sept. 3d: For August there was shipped from W. F. & Co.'s office, in this city, bullion valued at \$335,174.74. Since Thursday they shipped 22 bars valued at \$57,595.65 and (same paper Sept. 7th:) since Sunday, 22 bars valued at \$43,920.68.

MEADOW VALLEY.—This mine is shipping about 60 tons per day to the mill. The amount will be increased soon. A new engine for the mill is on the way from Toano.

KHEDIVE.—This is the name of a new location on Spring Mt. An assay from the croppings gave \$43.47. The ledge is 4 ft. thick on the surface, is a solid vein, and shows as well on the top as any in the District. At a depth of 5 ft. a body of chloride 18 inches in width was struck.

PIOCHE MINE.—The usual amount of ore is being shipped to the Chicago mill, Meadow Valley. The lower level and stopes yield an abundance of fine ore. Connection has been made between the east and west winzes by a large drift, a fine body of first class ore has been opened up, and a large quantity is now in sight. The shipment for August will average \$40,000.

STETTFELDT FURNACE.—The machinery for the Stettfeldt furnace in Meadow Valley has arrived, is being placed in position, and will start up in about two weeks.

HEAVY WORK.—J. Cahill assayed for the Raymond & Ely M. Co., during August, 46 bars valued at \$135,525.42.

AMERICAN FLAG.—Work has been suspended, as it is bonded to a Chicago Co. The mine is thoroughly developed, and has an immense quantity of ore on the dumps, which will average about \$300 per ton.

PROMISING MINES.—The mines owned by P. McCannon & Co. are showing good indications. The ore from the Washington is worked at the 5-stamp mill in Bullionville, and enough is on the dump to keep it running for 2 months. The Silver Peak mine is down 100 ft. and taking out good paying ore, with about 80 tons on the dump. A tunnel is being run to make connection with the shaft. It is in 97 ft. The Giant mine is looking well. Shaft down 32 ft. and a ledge about 24 ft. in width in sight, with indications of striking a large body of ore.

MILLS.—Day Valley mill has 30 stamps, 13 pans and a rock breaker. It is also supplied with 2 sets of boilers—1 of 2 and 1 of 3. The engine is about 130 horse power. Raymond & Ely has 20 stamps, 10 pans, 4 large and 6 small ones, 5 settlers, 3 retorts, and a rock breaker. During August, 46,081 lbs. of amalgam were produced; and on Sept. 1st (clean up day) was produced 2,604 lbs.; and on Sept. 3d, 1,055 lbs. Chicago mill has 10 stamps and is running on ore from the Pioche mine. 5 more stamps will soon be added to the battery when it will crush dry. The hullion at present turned out averages from .800 to .900 fine. Raymond custom mill has 5 stamps running on ore from the Washington mine. The hullion turned out averages .820 fine and in amalgamation the loss of quicksilver is but 2½ lbs. to every ton used.

### HUMBOLDT.

BULLION SHIPMENT.—Unionville *Silver State*, Sept. 9th, W. F. & Co., shipped from Arizona mine since our last issue hullion valued at \$6,767.

DUN GLEN.—Sprague & Co.'s new mill is rapidly nearing completion. The Co., have on the dump at one of their mines 200 tons of good milling ore. It is stated that the Bowen mine, and one or two ledges adjacent, have been sold for \$28,500.

TO BE REBUILT.—The Butte Mill, at Rye Patch, recently destroyed by fire will be rebuilt.

THE ALPHA MINE is producing ore that yields \$100 per ton.

BUTTE M. Co. have shut down their mill for repairs. The Co. propose to erect an Aiken Furnace.

### REESE RIVER.

BULLION SHIPMENT.—Austin *Reveille*, Sept. 5th: During August, W. F. & Co., shipped 77 bars of hullion valued at \$57,733.08.

THE PACIFIC M. Co., shipped yesterday to London, 15 bars hullion valued at \$9,753.19.

BELMONT BULLION.—During August, Paxton & Co., shipped from the California Mill Belmont, 62 bars, valued at \$34,660.98, and 7 bars, valued at \$9,951.63 from the citizens mill for the same period.

ARRIVED AT WINNEMUCA.—W. F. & Co. received this week from Silver City, Idaho ten bars hullion for shipment valued at \$21,000.

AMALGAM.—4,200 lbs. of amalgam were reported yesterday at the Manhattan mill. During the month of August this Co., shipped 85 bars of bullion, 6,419 lbs worth \$77,026.49, besides which they have on hand, of last month's working, bullion, crude, and in bars, to the value of about \$24,000.

METACOM.—This mill is being thoroughly repaired, and will be ready to commence in a month. A White's revolving furnace will be substituted for the old one.

The Pacific Co., will run the mill upon ore from Lane & Fuller's shaft. They do not intend to do any custom work.

MONITOR MINE, BELMONT.—There has been since the 1st of March about 200 tons of ore taken from the mine, of a high grade. The tunnel taps the ledge at a depth of 275 feet, at which varies in width from 2 to 16 ft.

### WASHOE.

BULLION SHIPPED.—Gold Hill *News*, Sept. 8: The Bank of California yesterday shipped \$61,000 in silver bars, principally from the Belcher, Crown Point and Yellow Jacket mines; on Sept. 6th, \$18,000, principally from Crown Point; and on the 5th \$66,500 from Crown Point, Yellow Jacket, and Chollar-Potosi.

ORE YIELD.—Last week the Chollar-Potosi yielded 620 tons of ore, assaying \$46.50 per ton on the average. Last month 680 tons of ore from the new body in the Belcher mine yielded \$55,134, being nearly at the rate of \$77 per ton. Crown Point is yielding about 200 tons per day. The 900-foot level is improving in appearance. The Hale & Norcross yielded 295 tons of ore last week, and the Savage 591 tons.

The indications in the Daney mine are better than usual.

AUGUST RECEIPTS for the Caledonia mine footed up \$17,212.

LADY BRYAN.—A large amount of excellent ore is being got out of this mine and collected on the dumps.

THE NEW SHAFT of the Overman M. Co., situated 1,500 ft. east of their old original shaft, had reached a depth of 65½ ft. on Saturday.

SUTRO TUNNEL was in yesterday a distance of 2,404 ft.

SAVAGE MINE.—Three mills are running on ore from the Savage, and still ore is accumulating at the mills and dump of the mine. At some of the mills over 1,000 tons

of ore are piled up, and there is a great quantity at the dump.

THE BELCHER MINE.—The body of ore on the 1,100-ft. level of the Belcher mine is proving of great richness and extent. It has been opened upon for a distance of 196 ft. north and south, and as it is followed to the southward it improves in quality. Assays of ore taken from the face of the drift (extreme south end,) run from \$100 to \$200 and upwards per ton. In Crown Point the deposit has been opened upon a distance of 240 ft. in length and some 70 ft. in width. Adding to this the distance to which it has been opened upon in the Belcher, it gives 346 ft. as the known length of the body ore.

NEW BLOWER.—The Yellow Jacket Co. have put in a new patent Root blower at their south hoisting works.

THE BIGGEST PAN YET.—Taylor & Co. are now engaged in the construction of a pan for working tailings, of the Parke pattern, which will be 12 ft. in diameter and 8 ft. high.

HOT WATER IN THE OPHIR.—Virginia *Enterprise*, Sept. 11: The Ophir shaft has now attained a depth of over 1,000 feet. The water now finding its way into the shaft is quite hot.

ACCIDENT.—Yesterday as a cage loaded with miners was being lowered in the Ophir mine, a stone fell from above striking one of the miners on the left shoulder. Upon examination the bones of the shoulder were found to be broken. The requisite surgical assistance was rendered. The injured man was a Russian named Louis.

ANOTHER ACCIDENT.—Last evening, at the south Yellow Jacket works, by some mistake a car load of miners, in being hoisted from the shaft, were run up to the shackle or pulley at the top of the hoisting frame. One of them, by the name of Burke, in jumping off the cage, strained both ankles quite severely.

SHELL CREEK MINES.—Cor. same Sept. 2d: The mines are scattered over a range of country 14 miles square. Of the North Hill mines the principal one is named the Woodburn. The formation is limestone, of the same character as that which prevails in White Pine and Eureka. But below the limestone runs a strata of quartzite something similar to Pioche, and again below that is a heavy formation of porphyry which bursts out in croppings. The croppings have been stripped off exposing to view a vein of very high-grade ore about 3 ft. thick. The character of the ore is chloride and sulphuret, and the matrix a true loose-grained quartz. The other prominent locations on the hill are the Jupiter, an immense outcrop of silver-bearing quartz; the McMahon, which displays a fine body of ore, average lots of which, worked at the Big Smoky mill, Hamilton, yielded from \$300 to \$400 per ton; and the Summit, which is said to be a good mine.

QUEEN SPRINGS.—Situated about 4 miles from Schellhorn, is easily accessible. I was a pioneer of Washoe and White Pine, and have lived in nearly every district in the State, but I think that next to the Comstock, Queen Springs is the biggest thing ever struck in the State. It is said that South Camp, 12 miles from here, surpasses even Queen Springs. At Queen Springs, there is a well defined ledge running north and south, which is traced for over half a mile. I commenced at El Capitan, on the north end, and followed along the ledge to the Nutmeg, and in no place for this distance (half a mile) can a piece of rock be knocked off the croppings which does not display mineral. The ledge is well defined between walls, the pitch being west, and a well defined clay seam occurring between the ledge and the hanging walls. The Nutmeg, as before stated, is the only location on which much work has been done. From this the surface has been stripped for a length of about 25 ft. by a width of 15 ft. and the entire exposed surface is ore, ranging in value from \$300 to \$1,000 per ton. There are about 200 locations recorded on the hill, but there is still a big chance for prospecting. The facilities for getting out and hauling the ore are first class, and water and wood are abundant. In the cañon is room and water for an unlimited number of stamps. Cor. *Enterprise*.

### WHITE PINE.

BULLION SHIPMENTS.—W. P. *News*, Sept. 7th: Shipments for the week foot up \$27,697.43.

SILVER WAVE.—A vast improvement has taken place in the quantity and quality of the ore during the past week. It is almost safe to say that before three months the fact will be demonstrated that a continuous ore channel runs through the Hill, commencing below the Elberhardt—taking in that mine, the South Aurora, Iceberg, Eclair, North Aurora, Ward Beecher, Con-

# PATENTS & INVENTIONS.

## Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

### FOR THE WEEK ENDING AUGUST 29.

BEDSTEAD FASTENING.—Elisha T. Barlow, San Francisco, Cal.  
AEROSTATIC JACK.—Anthony V. Ojeda, San Francisco, Cal.  
DENTAL PLATE.—Smiley Purvine and Harrison Smith, Salem, Oregon.  
APPARATUS FOR UNLOADING HAY, ETC.—Edmund Harrison, Mountain View, Cal.  
HARVESTER.—James Hazel Adamson, Auburn, South Australia.  
HAY PRESS.—Oscar Bosseé, Millbrae, Cal.  
PAVEMENT FOR STREETS, ETC.—William H. De Valin, Sacramento, Cal.  
CAN-OPENER.—Edward M. Dewey, San Francisco, Cal.  
TUBULAR STEAM BOILER.—Oliver Hyde, Oakland, Cal.  
BADGE.—Nathan Joseph, San Francisco, Cal.  
BADGE.—Nathan Joseph, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

FEED CUTTER AND GRINDING MILL.—Carlos R. Donner, Sonora, Cal. This invention relates to certain improvements in feed cutters and grinding mills combined, and it consists first, in an improved arrangement of mechanism for feeding forward the straw or hay to the knife; and secondly, in the employment of a grinding mill for grain feed, which shall be actuated by the same mechanism which drives the cutter. The feed box is of the ordinary shape and is constructed with a pair of wheels which can be raised or lowered by the movement of one pair of legs so that when the wheels rest upon the ground, these legs serve as handles by which to move the machine from place to place. The cutting knife is curved, and secured with its guard to one of the arms of the fly-wheel, which revolves at right angles across the front of the box. A cylinder is secured to the shaft of the wheel and this has a cam groove made in it, so as to actuate an arm which extends down to it from a shaft across the top of the feed-box. The grinding mill is secured to one side of the feed-box, and has suitable grinding apparatus within which is actuated by connections from the fly-wheel.

MACHINE FOR TURNING SPIRAL MOULDINGS.—Ed. A. Stockton, S. F. The object of this invention is the construction of a machine in which spiral mouldings can be readily turned by simply putting a square stick of the proper size, through the machine, and it consists first in the employment of a novel device for turning the stick, to form the spiral, as it passes through; and secondly, in passing the stick after it has been rounded, through a peculiar feeding nut or barrel into which a V-shaped outter extends and forms a groove, and this groove in combination with a screw thread, feeds the stick forward. It also consists in the use of a lateral bit, or chisel which revolves so as to always cut the wood with the grain, and thus avoid giving a rough surface.

BLIND SLAT RIVING MACHINE.—Paul Schumacher, S. F. Cal. This invention relates to certain improvements in machines for riving or splitting out the slats used for window blinds or shades, and it consists of a suitable box in the bottom of which are fixed a number of cutting knives. A sliding frame is arranged to be moved forward and back inside this box, and it carries the block from which the blind slats are to be cut. This block is pressed down by rollers which are fed downward automatically after each cut.

ROASTING FURNACE FOR ORES.—Knox & Osborne, S. F., Cal. This furnace is an

improvement upon one for which a patent was obtained by the same parties June 14th, 1870, in which a series of pigeon holes admitted the heat to the ore, and another series upon the opposite side carried it off

## CRAIG & BREVOORT'S PATENT CONDENSER FOR STEAM PUMPS.

The following description, which we copy from the *Iron World*, will be found of

Fig. 1.

SECTIONAL VIEW OF CONDENSER.

after the work was done. In the present case the furnace is constructed with a series of vertical arches, each lower arch receding from the one above, so that their angle will be greater than that slope at

interest to all users of steam pumps, especially those in mines and other places where exhaust steam is a trouble. The power of the pump is increased materially.

Fig. II.

OUTSIDE VIEW OF CONDENSER.

which the ore will stand, and the clogging of the openings or pigeon holes is thus avoided. It also consists in the use of a feeding device or box which can be filled with the brush usually used for fuel, and then when the door is opened it can be swung in and discharged, and the door instantly closed to prevent the escape of heat.

The annexed engravings represent a condenser to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines, the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on

its entry into which it meets the water drawn by the pump, and is immediately condensed. Fig. 1 represents a vertical section of the condenser, and Fig. 2 an elevation.

The flange, *D*, is screwed to the suction orifice of the pump, and the flange, *S*, to the pipe leading to the well or whatever source of supply the pump may have; *W* is a water jacket surrounding the main chamber of the condenser, *B*, and with which the suction pipe, *S*, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through which the series of openings, one of which is shown at *a*, and from thence into the body of the condenser, *B*, through pipe, *P*, carried by float, *F*; the pipe, *P*, also acts automatically as a valve to enlarge or contract the space through which the water enters, by which means the possibility of the condenser being at any time flooded is avoided. The pipe, *P*, it will be observed, also acts as a guide to the float, *F*.

The valve, *C*, (shown in Fig. 1), which is raised or lowered by means of a screwed stem—shown coming through the elbow in Fig. 2—is for the purpose of increasing or decreasing the flow of water, according to the capacity of the pump to which it is attached.

The exhaust pipe from the steam cylinder is screwed into the cover at *E*; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to the water cylinder of the pump through *D*. The vacuum which is of course immediately formed, acts on the exhaust side of the steam piston, aiding in its work in proportion to the amount of vacuum obtained.

When we consider that steam pumps are usually constructed with steam cylinders, from three to four times larger in area than the water cylinders, and that we have a vacuum equal to about 13 pounds pressure, which vacuum has the large piston of the steam cylinder to act upon, we see that the pump is exactly in the position of any condensing engine. Suppose we take a pump of the following dimensions: 6 inches diameter of steam cylinder, 3 inches diameter of water cylinder, pumping against, say, 80 pounds. The steam piston will have a pressure of, say, 25 pounds above the atmosphere on it. Five pounds of this is used up in overcoming the friction of the pump, and the other 20 pounds is left to perform the work. The condition of the pump, if a condenser were attached, would be as follows: 13 pounds of the steam pressure would have its place taken by the vacuum; consequently 12 pounds of steam would be sufficient for the working of the pump. This is a direct saving of 52 per cent. when pumping at 80 pounds pressure in the water cylinder. When the pressure against which the pump is working is less, the percentage of gain will be greater. The economy is plainly shown by figures; also by indicator cards taken from the pump, from which cards the above calculations were made.

It is, however, not only in obtaining a vacuum that the advantage of this condenser in its application to steam pumps consists. When the pump is used for feeding a steam boiler, or for any purpose requiring hot or warm water, all the heat of the exhaust steam, except that which is unavoidably lost by radiation, is utilized, and consequently the economy effected thereby is very great.

The extreme simplicity in the construction of this condenser is such that it can be managed and taken care of even by those who are not thoroughly conversant with all the details of the condensing steam engine.

If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser and acts as if it were not attached.

This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam.

For further information apply to Henry L. Brevoort, No. 128 Broadway, Room 13, New York.

Out of three hundred and seven millions of people carried on English railroads in 1869, only seventeen were killed by causes beyond their own control, while in the streets of London one hundred and forty persons were killed, and it is estimated that the orange-peel thrown on London pavements kills more than all the English railroads.

## CANAL PROPULSION.

Since the one hundred thousand dollar reward was offered by the State of New York for the best device or means for propelling canal boats, the ingenious *geniuses* of the country have been laboring with an eye to the acquirement of this handsome prize. Many of the plans suggested have merit, but the trouble seems to be that the requirements of the law under which the prize is to be awarded, are such, that but few can enter their plans for competition. For instance, it is required that at least three trips must be made between Buffalo or Oswego and New York with each device presented for competition, at the expense of the person presenting it. Now this alone, if no other obstacle were presented, will deprive hundreds of inventors from presenting their improvements, as in most instances the outlay required will be more than they can afford.

The consequence then will be that the contest will be confined to the few who have means enough to encounter the necessary expense, or who can induce some capitalist to invest the money for a chance in the prize. After all it may be that the very object aimed at by the law, will be defeated by its own conditions.

It is well enough to offer a reward for inventions of value to the public; but the mechanic of small means should be given a show, as it is from them, as a general rule, that the best and most practical inventions emanate.

Such laws are usually framed and lobbied through the Legislature for a purpose; and if this law had been passed in California instead of New York, we should conclude at once that the whole thing was a "put up job" to put the public money in the pocket of a certain person, for whose benefit it was purposely made; in other words, that it was the work of a "ring." But as they do not do such things in New York (?), we refrain from making the remark.

Nothing would please us more than to learn that some inventor upon this coast had obtained this prize. We should then "got even" with New York for the \$100,000 which was swooped out of this State by the holder of the lucky ticket in the "Mercantile Library Lottery."

The one device which seems to meet with most favor, and the one which many already acknowledge bids fair to win this large prize, is the one designed and operated by Mr. Thomas Main, mechanical engineer, of New York. This device consists first, in remodelling the construction of the canal boats now in use by leaving a channel extending the entire length of the boat, underneath its bottom, so that it will have two keels—one at each side; and secondly, by placing the propeller in the forward end of the boat, so as to work in the channel thus formed. By this arrangement the agitated water is compelled to pass under the entire length of the boat, during which time it is "smoothed out," as it were, thus preventing any side wash upon the banks of the canal. Other improvements have also been added in the way of machinery, and altogether this may be considered the winning boat,—a fact, we doubt not, well known to the inventor long before the law offering the prize was passed. The *Scientific American* speaking of this vessel says:

A boat constructed on this principle has been for some time regularly employed upon the Erie Canal in N. Y., carrying, besides the machinery, 200 tons of cargo, at a rate of three miles per hour, including lockages, or seventy-two miles in twenty-four hours, consuming only a ton of coal, \$5, against \$28.50 for two horses' towage for the same distance—a saving of half the wages of the crew, and transporting the goods in the same proportion of time—and, additional to its own cargo, it can tow a similar barge at very nearly the same speed. This boat can go through a lock in

six minutes, against twelve minutes required for a horse boat, and is then handled by one man with ease. There is no injurious action on the banks, and the boat can leave the canal and proceed as quickly and safely on river navigation with her self-contained power. In twelve months, such a boat, 70 feet long by 16 feet wide, and 9 feet depth of hold, with an 8 inch cylinder, driving a 4½ feet propeller, can pay for her entire cost from the saving over horse boats, to say nothing of the certainty and dispatch which alone insures the confidence of the mercantile community, and is the foundation of extensive patronage.

With this record it is hardly possible for any device now known to step in ahead and take the prize, even if the law was not made with special reference to it.

There is one question, however, that naturally suggests itself in this connection: If the idea of the law makers was to reward the inventor of this device, why offer false inducements to cause the mechanics of the country generally, the most of whom already have hard work to support themselves and families, to spend their time and money for nothing? The above device seems to fulfil every condition of the law, and besides, it "has been for some time regularly employed on the Erie Canal," so that its existence and value was certainly known to all concerned in framing the law previous to its enactment.

We do not wish it understood that we oppose the offering of a handsome prize for valuable inventions; but what we do oppose is the special legislation of money out of the pockets of the people into the pockets of a certain person, and his admirers and followers, by blinding the people with a law pretended to be for the benefit of all. If the invention is a valuable one, its proprietorship will be the inventor's reward.

What we would like to see would be a law appropriating \$75,000 to be used in testing the inventions which promise the best results, and the remaining \$25,000 to be a premium to the inventor of the one chosen as the best. This would offer inducements to every class of inventors and would in the end produce the best practical results.

## Characteristics of the Brain in Different Animals.

Prof. Wilder at a late meeting of the Ithaca Farmers' Club, showed the brain of a kitten a day or two old. It had quite an imperfect appearance as compared with the brain of an old cat. The reason, he said, is obvious, the kitten is born blind and helpless; it learns to move and act—hence it is born with but partially developed brain. There was also the brain of a calf and of a steer—both were nearly alike except as to size. The reason is obvious—the calf at once or soon is to use its limbs and all its faculties, and hence its brain is so perfect.

Dr. S. J. Parker, called attention to the four brains exhibited by Prof. Wilder. Those of the calf and steer are coarse in their convolutions, both in the cerebrum and cerebellum, while the cat has a finer convolution in her cerebrum and a very fine convoluted cerebellum. He says the reason for this is also plain. The motions of the calf and cow are coarse and rough compared with the cat. The mind of a cat is limited in capacity, but keen and exact as far as it goes, hence the coarser cerebrum, while the motions of a cat are peculiarly graceful and brilliant, hence the fine texture of the cerebellum. If, then, the theory is true that the cerebrum is the organ of the body by which the mind acts, and the cerebellum is the organ of muscular combinations, then this exhibition of brains corresponds with our knowledge, and is a happy proof of our ascertained facts. Such are the uses of the exhibitions of these specimens.

TRAINING HORSES.—An ingenious German has gained a great reputation in New York by his success in training coach-horses to a grand gait. He used no burr-bit or other cruel contrivance, and people couldn't see how he did it until it was found that he put magnifying goggles upon his horses, which made cobblestones look like boulders, and they acquired a grand tread by trying to step over them.

## GOOD HEALTH.

## Disinfecting Excreta.

It is of the greatest importance that people be made to know that human excreta from all persons affected with typhoid fever, scarlet fever, cholera and other infectious diseases should at once be disinfected by diluted carbolic acid, or sulphate of iron. Typhoid fever for instance, often spreads through a family, or a neighborhood by means of the water used; but it is likely that ten times as many cases are generated by means of the poison passing through the air. Now how does the poison get into the air, and find its way to the bodies of other persons in such quantities often as to assume an epidemic form? Mainly, it is believed, by the excreta. Disinfect this. Kill those poison-germes that arise into the air in swarms, and there is little danger of the spread of infectious diseases. We do not claim that all infectious diseases come from germs generated in the excreta, but in civilized communities a majority of them either arise from the excreta, the breath, or the skin. Kill them as fast as formed without injury to the body, and you at once prevent the spread of the disease. Dr. Budd, an eminent English physician, declares that "from the day when I first began to think on these subjects, I have never heard a doubt that the specific cause of contagious fevers must be living germs." These living germs are generated in the filth of the world. Prevent them from breeding, and you prevent most of the diseases that afflict the race. The amount of excreta that accumulates about the dwellings of every family is very great. Even from healthy persons it may cause disease. To prevent this we advise general disinfection and cleanliness—one of the most important hygienic agencies in preventing the spread of disease that we can at present adopt.

## Meat in Summer.

Whatever may be said in regard to the use of meats generally, there is scarcely a question that the less meat eaten during hot weather the better. In the first place, the process of decomposition commences in meats the moment the animal is slaughtered, and continues without cessation, unless arrested by salting, smoking, etc., until it is entirely decomposed. In hot weather this process proceeds very rapidly. Meat just from the butcher is always tough, and it must become partly decomposed before it becomes tender and fit to eat. It is this decomposition that makes it tender, and the further this process has proceeded, the tenderer the meat. The eating of meats in this condition, especially in hot weather, poisons the blood with the products of decomposition, stimulates the system to unnatural action, increases the heat, produces a general condition of feverishness, and renders the person more liable to fevers, inflammations, and other diseases. If the meat gets a little too "tender," it is almost certain to bring on an attack of diarrhea, and many cases are caused in this way. If you value health and comfort, use meats sparingly and fruits and vegetables freely during hot weather, if at no other time.—*Herald of Health.*

VENTILATION.—The experience of Dr. Gray in his attempts to perfect the ventilation of the Utica Asylum, points clearly to the fundamental fact that no very large building can be ventilated with currents of air produced by heat alone. Artificial currents produced by mechanical power must be employed. The means used in this institution are a large and powerful fan wheel, driven by a fine Corliss steam engine. By its constant action, every nook and corner of the vast building was kept in a delightful state of coolness on the day of our visit, though the thermometer indicated 80 deg. Fah. in the shade. A large volume of air was constantly flowing through the various wards, yet there was no perceptible current.

A QUICK RECOVERY.—A Scottish trader was constantly afraid of his health, and imagined himself ill of every epidemic that was going. At length the cattle plague broke out, and he persuaded himself that he was ill with the disease, and sent in haste for the doctor, going over the symptoms of which he had read in the papers, all of which he fancied he had. "I hope you don't really feel so," said the M. D., "for there is an order by the Privy Council that every beast with these symptoms, must immediately be shot." The trader was soon well again.

## Compression of the Feet.

This is a common practice, that often results in distortion. When we are walking with the feet unrestrained, each foot as it receives the weight of the body, broadens slightly, and lengthens to the extent of half an inch or more. Freedom of motion in the foot itself is thus seen to be a natural requisite, and without it, ease, grace, and comfort in walking are out of the question. Compression by the boot or shoe not only prevents this freedom of action, but also gives rise to deformity of the feet. The sole of the boot should be as wide as, and somewhat longer than the foot, when the weight of the body is resting upon it. The upper leather requires to be soft and yielding, and not so tight as to pinch the foot down upon the sole. The toe of the boot ought to be wide, leaving the toes perfect freedom of movement. If too narrow, they are made to override each other, thus producing the ingrowing toenails, corns, bunions, etc. The heels should be low and broad, so as to furnish a firm support. High heels throw the feet forward toward the points of the boots, and tend to produce flattening of the arch of the foot.—*Herald of Health.*

SLEEPING ON THE RIGHT SIDE.—Sleeping on the right side, in addition to permitting a freer action of the heart, has the great advantage of favoring the escape, through the pyloric orifice of the stomach, of that organ's contents by gravitation; the stomach then lying in an inclined position from left to right, which it also assumes when one is in the erect attitude. For people who limit themselves to light or easily digested suppers, or who go supperless to bed, the posture of rest may be a matter of indifference; but to individuals who are inclined to rotundity, or indulgence in hot suppers and accompaniments, the best way to avoid, or facilitate escape from uneasy sensations, is a question of interest.

DOCTORS AND THEIR FEES IN THE "OLD TIMES" IN IRELAND.—The *Medical Gazette* says: "The following curious mode of providing for the payment of the medical profession, prevailed in Ireland under the Brehon laws prior to the thirteenth century. A law in relation to the doctors, enacted that their fees should be proportioned to the rank of the patient, and the nature of the complaint. It was also held that no fee should be paid unless a cure were effected. Fourteen *cumhals*, or forty-two cows, for example, were the fee for curing a bishop, or local chief, while the health and bodily welfare of a member of the lowest rank of the tribe, were valued at six cows."

AIR BEDS IN THE MORNING.—The wise housekeeper should see to it that all the beds should be aired immediately after being occupied. The impurities which emanate from the human body from insensible perspiration, are made up of minute atoms, which, if allowed to remain long, are absorbed by the bed, and will then, to a greater or less extent, vitiate the air for a considerable time afterward. Let the occupant throw the bed open on rising, and as soon as convenient open the windows and ventilate the sleeping-room. One hour's early ventilation is worth two hours' late airing.

MEDICAL KNOWLEDGE IMPORTANT FOR ALL.—It is a duty which every man owes to himself, to his family, and to the community in which he lives, to have sufficient knowledge of medicine, that under all ordinary circumstances he may be able to preserve his own health, act intelligently in concert with others to preserve the health of the community, give assistance in case of accident, and aid the physician in the case of disease by proper care and good nursing.

QUININE BISCUITS.—One of the London bakers has introduced a dietetic novelty in the shape of quinine biscuit. Each biscuit is estimated to contain one-fourth of a grain of quinine, and for delicate stomachs, or where it is desirable to disguise medicine as much as possible, or to combine food with medicine in a perfectly agreeable form, these biscuits are likely to become very popular.

CARPETED FLOORS.—When a carpet is taken up to be cleaned, the floor beneath it is generally very much covered with dust. This dust is very fine and dry, and poisonous to the lungs. Before removing it, sprinkle the floor with very dilute carbolic acid, to kill any poisonous germs that may be present, and to thoroughly disinfect the floor and render it sweet.

## Visit of Scientists to California.

The American Association for the Advancement of Science has accepted the invitation of the California Academy of Sciences to meet at San Francisco next year, upon the condition that arrangements can be made which will enable the best scientific men of our country to get across the continent. Scientists are seldom much blessed with an abundance of this world's goods; hence the necessity for the above conditions. If this body of scientists hold their next meeting in this city, they will be accompanied either by a number of distinguished European savans, among whom will be numbered Tyndall, Huxley, and others. Their meeting here would be an important and a memorable one, and one which cannot fail to be of vast benefit to the State. Governor Stanford, of the Central Pacific Railroad, will issue tickets at half price, and it is supposed that other railroads at the East will do the same. About \$7,000 will be required for the balance of the travelling expenses of such, as it may be desirable to present with free tickets, and to meet such incidentals, while here, as may be required to enable the Academy to do its duty handsomely to its visiting brethren. It is to be hoped that some of our "solid men" will come forward with the needful, and secure for our city and State this much to be desired visit.

IN MONTANA.—Mr. Wm. H. Murray, our corresponding agent, is now visiting Montana Territory, and will inform us briefly of the progress of its mining, farming, and other industries. Our list of subscribers there, already outnumbers that of any other journal published outside of the territory and will probably be greatly increased.

## New Process of Casting Water and Gas Pipes.

We were much interested, on Friday last, in examining at the foundry, corner of Harrison and Main streets, a new process which has recently been introduced on this coast, for the casting of water and gas pipes. This process, which is the invention of, and has been patented by John Farrar, of Boston, Mass., consists in the substitution for the ordinary clay molds, of a sectional 3-part, cast-iron flask, attached together with hinges, and secured by strong wrought-iron clamps. The inside of the flask (which constitutes the mould) is lined up with a preparation of fine clay and plumbago, secured in place by flanges, and which effectually resists the action of heat, over 600 having been cast from one flask without retiring. The flasks were ready for use, and suspended on trunnions, one end projecting over a pit. The process of casting consists of putting in place a core, clamping the flasks and hoisting it up on end; the molten iron is then poured in at the top, filling the space between the core and flask, and thus forming the pipe. As soon as the metal has "set," the flask is brought down to a horizontal position, opened and the pipe taken out. The lining of the flask is then washed with a preparation of black lead laid on with large paint brushes, when the process of casting is immediately repeated.

An average of about five pipes an hour is thus made from each flask while the heat lasts—which usually continues from two to three hours. On the occasion referred to three flasks were alternately used, by a gang of 18 men, who turned out a pipe about every five minutes.

The advantages of this process are: The flask makes a permanent mould, admitting of the casting of an indefinite number of pipes without renewal; uniformity in thickness, secured by equal pressure upon the core-barrel, and a close texture of metal and absence of sand holes—porous places, which are inevitable where it is cast horizontally. Messrs. Rankin & Brayton, the proprietors of these works, have now four flasks in position, from which they are casting from 500 to 600 feet per day of 4, 5, and 6-inch pipe. Other flasks, embracing all the usual sizes, will soon be in readiness, giving the works a capacity of one thousand feet per day.

The usual process for making pipe in the East is that of the ordinary sand mould, which requires an iron flask for each pipe, necessitating a large outlay for the equipment of a foundry of any capacity. The extraordinary advantages of this process are apparent, when it is seen that no moulding is required, and one flask is made to do the work of 12 or 15 on the old plan. This invention is justly regarded by iron men as the most important improvement ever introduced into this branch of the foundry business. The gentlemen above named have secured the exclusive use of the process for this coast, and the very remarkable facilities it affords will enable them to compete successfully with either Eastern or European manufactures, thus adding another most important and useful industry to our list of local manufactures. Some idea of the saving which this invention will secure to this State may be formed from the fact, that something like 60 miles of pipes are now on the way from the East to this city; but that in view of the improved facilities hereby offered, no eastern firm can hereafter afford to enter into competition with the work here.

The inventor having made the demonstration here, complete, will soon go East to introduce the process into the larger eastern foundries.

The above firm have been engaged for several months past in filling large pipe orders for the Metropolitan Gas Co., of this city, including some two miles of 16-inch drain, now being laid from Montgomery street to the works, corner of Ninth and Brannan. They have also additional orders in hand for some 20 miles of pipes, of various sizes, for the same company, as well as several orders from the interior gas and water companies.

## ON THE ASSAY OF GOLD.

BY HENRY G. HANKS.

[Expressly for the Press.—Continued.]

To make absolutely accurate assays of gold bullion requires great care, considerable skill, and first class apparatus.

It must be considered that the assayer who sends out bars stamped with his name, becomes responsible for all mistakes, and his reputation will suffer in proportion to the number of his errors. He should therefore take every precaution, and know that his assays are correct before he allows them to pass from his hands.

The skill may be acquired by practice, but the apparatus must not only be of the best quality, but must be kept in the most perfect adjustment. It is not enough to purchase chemicals which are marked "pure," or a balance or weights supposed to be accurate. The chemicals must be tested, and the accuracy and adjustment of weights and balance verified before accuracy of results can be certain.

Some assayers stamp their bars less than the true fineness, as ascertained by assay, so as to have a small margin to cover possible errors; but this is not doing justice to those who employ them. It is far better to use sufficient care to make the assays accurate, and then stamp the bars the full fineness as found.

The process of assaying gold bullion is obviously divided into several operations, as follows:

- 1st. Melting the crude gold, and casting the bar.
- 2d. Cutting the assay chips from it.
- 3d. The assay proper.
- 4th. Calculating the results.
- 5th. Stamping fineness and value on the bar.

For the melting, a wind furnace is best, but a good coal stove such as are used in offices for warming, will answer the purpose, if the amount operated upon is small.

The improved portable assay furnaces, which are sold by the San Francisco dealers, are admirably adapted for the use of assayers who melt small quantities only. The whole process of melting and assaying may be conveniently performed with the same fire. While the fusion is being made the muffle becomes hot and is ready for the process of cupellation.

This furnace is made of sheet-iron, lined inside with fire brick. Near the centre is the muffle, while on top is placed a sheet-iron pan, which serves the double purpose of a cover, and a convenient sand bath, in which the boiling may be conducted as will be described. This furnace has been lately improved by Messrs. John Taylor & Co., of this city, by placing the grate bars more distant from the bottom of the muffle, leaving space for the burning coal to fall below it. An opening is also provided through which fuel may be added below as well as above the muffle.

With this furnace gold to the amount of one hundred ounces may be melted, while the muffle is sufficiently capacious to admit of six cupellations at once.

The crucibles best suited to casting gold are those known as black lead crucibles. Small quantities may be melted in ordinary Hessian or sand crucibles, or those of French clay. For any small quantities the ordinary crucible tongs only, will be necessary; but for over fifty ounces it will not be safe to grasp the edge of the crucible with the tongs. In this case tongs must be provided, such as are used by the brass foundries,—which are constructed with crescent-shaped jaws, which close upon the outside of the crucible. Tongs must be made to fit the various sizes, so that when placed in a grasping position on the crucible rim an iron ring may be slipped over the ends of the handles to hold them together with a slight pressure.

Before a black lead crucible can be safely used, it must be annealed, were this neglected and it should be placed in the fire, without this precaution it would soon fly to pieces. This result is caused by the water which it contains being converted into steam and the structure of the material being such that it cannot make its escape, destruction of the crucible must follow.

It is best to commence annealing the crucible some time before it is wanted. It should be set near the hot furnace and turned occasionally. When the fire is nearly spent it may be placed rim downward upon

the hot sand in the pan on top of the furnace. A day or two of such treatment will make it safe to hold it over the open furnace, by the aid of the crucible tongs, or on a poker. After it has been frequently turned and is hotter than boiling water, it will be safe to place it rim down upon the burning coals. When the rim is red hot all danger is passed and it may be turned and placed in position for the reception of the gold.

If the fuel is charcoal, it will be found best not to use small pieces or at least not coal dust. Pieces the size of an egg or larger will make the best fire. When the crucible becomes red hot, a piece of ¾ inch gas pipe is used to blow out any dust or ashes that may have fallen into it, a cover is placed on it and pieces of coal built up around it; this is best done with a pair of cupel tongs. The position of the crucible in the furnace, such as I have described, should be on one side of the muffle, not upon it, but the bottom of the crucible should not be permitted to sink much below the level of the top of the muffle. In the event of its doing so, it may be grasped with the tongs and gently lifted, allowing the coal to fall below it.

When the crucible has attained a full red heat, one or two spoonfuls of borax is wrapped in paper and placed in it by the aid of a pair of long cupel tongs. The spoon I use for fluxes is one made of horn about the size of an ordinary table spoon.

When the borax has melted, wrap a small quantity of gold dust in paper and place it on the crucible in the same manner. Several portions may be thus added according to the size of the crucible. A fresh supply of charcoal must be placed round the crucible when required, the cover having been previously replaced. When the gold has melted down, more is added in the same manner, until the crucible has received all that is to constitute the bar. In the meantime the ingot mould in which it is intended to cast the gold must be made clean and smooth inside. This is best done by rubbing with sand-paper and oil, or with a dry piece of pumice stone. It is then wiped dry and clean with a rag, oiled slightly and placed on the edge of the furnace in such a position that it may become quite hot, not so hot, however, as to approach redness nor to cause the oil to burn.

[To be continued.]

## Close of the Mechanics' Institute Exhibition.

### Award of Premiums.

The Eighth Exhibition of the Mechanics' Institute closed on Saturday last, and in a few weeks the old structure on Union Square will disappear; but the recollection of the scenes with which it has been connected will long linger in the memory of both old and young.

The exhibition just closed has been an eminently successful one, both in the display itself, and as a financial enterprise. The closing ceremonies were preceded by an excellent and appropriate speech from the President, Mr. Hallidie, in which he remarked that it had been opened for 29 days, and that it would probably be many years ere another would be held. By an actual count, 21,756 persons had visited the Fair in a single day. The number of entries had been 1,895; the total receipts \$60,000—expenses, up to that time, \$26,000; which would leave a balance toward paying off the mortgage on the Institute, Library building and increasing the library itself, of \$34,000, to which amount would be added about \$12,000 more by the sale of the building, fixtures, etc.

We shall give the Premium List next week.

ALMOST FOUR TO ONE.—The total amount of the cereals—wheat, rye, oats, barley, corn, and buckwheat—raised in the United States last year is estimated at one thousand five hundred millions of bushels; or about 38 bushels to each individual in the country. The average consumption is about eight bushels to each person; hence we have for export, for feed, for stock and for distilling purposes about 29½ bushels to each person.

THE advertisement of "Frey's Improvement on Evans' Under-current Sluices," next week.

## SELF-ACTING GATE.

This invention, which we originally illustrate, relates to that class of gates which work automatically. By an ingenious mechanical application it is arranged so as to open and shut at pleasure, by the passage of the wheel of the vehicle over a crank in the road. These cranks are arranged so that running over them, on either side, in the direction of the gate, opens it, and by going from it the gate is closed. A system of gears, rods, chains, and pulleys, connect the cranks with a toothed wheel operating in a rack under the base of the gate, as partially shown, which moves it open or shut, according to the direction the cranks are operated. The construction of the frame may be varied according to taste, and the roadway planked or not, as desired. The machinery is light and simple, yet sufficiently strong to last for years, and is comparatively reasonable for the real convenience of its use. As a general thing, but two cranks are required, one on each side of the gate; but in the case represented by the accompanying cut, there are two cranks on one side and one on the other. In entering the gate from the road, where there is not room enough to turn and enter the gate directly facing it, a crank on each side is more convenient from the fact that an approaching vehicle would have ample room to pass over either crank, and then make the turn without cramping or other difficulty. The bed timber, with the rail on top upon which the gate slides, is firmly imbedded in the ground, and the gate, resting on it, is thereby prevented from sagging, and the guides on the rails retain it in the proper position.

High winds do not affect its working freely, and it cannot be left open except through the neglect of the driver to run the wheel over the crank opposite the one by which the gate was opened. No cattle, however vicious, can get through it; for, on closing, a spring snaps through the gate into the beam, precluding the possibility of running it back except by means of the crank or a human hand. The cranks can be placed at any distance from the gate, by means of the boxes buried in trenches through which the leading rods run, so that a team of any number of animals can pass through without the driver having to leave them.

The patent for this gate has recently been allowed through our agency to Edmund Higgins, now of Vallejo.

**THE ENGLISH TELEGRAPH SYSTEM.**—Under the management of the Post-office Department, is proving a decided success. While the cost of telegraphing has been greatly reduced, the net earnings have been increased, and during the same time the work of extension and repairing has been more than the average of past years. The time is not far distant when the telegraph system of this country also, will be placed under government control, and be made a part of our post-office system.

**CHICAGO LARD** is being received at the rate of one and two car loads per week, and finds ready sale, three car loads having been sold in this city the past week.

## Water Pipes.

BY OUR NEW YORK EDITOR.

What Shall we use for Service Pipes for Household Purposes.

This most important question has been answered in a dozen different ways within as many years but people even yet do not seem satisfied. Let us look at some of the materials which have been brought forward to answer this question. Galvanized pipe, bad from the first moment. The lining of zinc too thin to be of any use in protecting the iron. Zinc is poisonous and so are its compounds. It is readily taken up by the water and in fact it protects the iron at the expense of its own corrosion. Iron, is fairly safe, but not good. Iron will rust, and iron rust water is better for a medicine than for a drink or for household

The tin is as thick as safety requires, and the lead outside is as strong as you want it, like any lead pipe. "How shall you know this pipe if you see it?" The inside is almost as bright as silver and on the outside are four little ridges extending the whole length of the pipe equally distant from each other.

If you inquire about this at your plumbers there is no knowing what they will tell you. They have all manner of stories about "can't solder joints," "unequal expansion" of the two metals, worse than lead, etc., etc. We have heard all that before, and from people who knew better. Just tell them, however, that another New Yorker invented a joint which is as strong as any part of the pipe and don't take a plumber to make it either. It don't cost much. It does away with all the trouble that they have ever had with such work; its quicker too. Now I have no ax to grind, and I can't tell you anything about prices, though it is my impression that it costs about the same as lead pipe; a little more

HIGGINS' SELF-OPENING AND CLOSING FARM GATE.

uses, as it is ruinous to the teeth. Lead; almost all waters corrode lead and carry it along with them. One water in ten may not, but the reverse is the rule and it won't do to trust that the water you use is an exception. Lead pipe makers tell you that it is safe. They have an ax to grind and lie to help the grinding. They know that the best of drinking waters in almost every case will corrode lead and the water will be poisoned.

The worst of lead poisoning is that you may take a little now and not feel it, a little next week and no effect, and so on, but when the whole amount is sufficient to produce the poisoning, then look out. Not a particle of lead that once gets into the system ever gets out. It is an accumulative poison. Rubber can't be trusted mechanically. Well you all know what I am coming at. Tin, yes that is the metal. Pipes were made with a wash of tin inside. It was too thin, it broke or wore away, exposed the lead and then you were as bad off as though the pipe was of lead in the first place. Some said galvanic action! That's a mistake, the metals are so much alike in some respects that galvanic action don't take place between them. So you are no worse off even after your tin is gone than if you had a lead pipe. But pipes are lined with tin in these days in a way that makes a tin pipe inside a lead one. A New York man invented the process several years ago. The thinnest coating of tin used, is as thick as card board. The lead outside is as stout as in any lead pipe. Here we have it then.

I think. I never bought an ounce in my life; I don't know the address of the firm that makes it; you will find it in almost any of the Eastern papers. I think I may be pardoned if I say that a letter addressed to Mr. — Shaw, 213 Centre street, New York City, — I don't know his initials — would probably bring you all the further information which you wish. I speak freely, because I feel that it is high time for people to understand that lead pipes will poison. It is only a question of time. Tin pipes and tin lined pipes are safe and they are not expensive when we look at the danger arising from the pipes in use. Now reader if you poison yourself with lead water pipes my hands are clear of you.

**CHLOROFORM AND ROBBERY.**—It appears to be the opinion of the most eminent medical writers that the reports of the use of chloroform and similar agents in facilitating robberies, etc., of persons while asleep, are without foundation—that such agents cannot be efficiently employed in stupefying persons against their will without alarming them. It is said that its application to a sleeping person is so attended with choking and retching, that the soundest sleeper would likely be waked before stupefaction was complete.

**GNATS IN THE EYES OF CATTLE.**—A serious eye disease among cattle is reported as prevailing in Kansas City, Mo. The supposed cause of the trouble is gnats getting into the eyes of cattle that drink at stagnant pools.

**BEEES** are now sent by mail, confined in a square block of wood, with auger holes bored in it and covered with wire gauze.

## NOTES AT THE S. F. MECHANICS' INSTITUTE FAIR.

[In these notes we have room only to notice briefly such articles as come specially under our observation. More replete descriptions of the most interesting and instructive exhibits will be given in the Press at our greater leisure hereafter. No classified catalogue being published we do not in this number give complete notices in any particular department.]

**PRESERVED MEATS.**—Messrs. Ross, Dempster & Co., make an exhibit of Australian preserved meats, a commodity which bids fair to form an important article of commerce.

**ROTARY DIGGER.**—This is a new device for breaking up the soil, invented by Mr. S. Johnson, of this city. The machine is intended as a substitute for plowing, harrowing and cultivating. Mr. J. is about adding an important improvement to the "digger" in the form of knives, which are intended to precede the digger.

**CALIFORNIA MADE AUGERS.**—We have

here another new item of California manufacture, made and exhibited by E. W. Mitchell & Co., of Napa City. These we believe are the first augers ever manufactured in California. They are made of the best cast steel and have the manufacturer's warrant that every instrument shall give entire satisfaction. We trust the experiment will prove a paying one.

**RAWHIDE BELTS.**—Mr. H. Royer, 437 Brannan street, makes a very fine display of his rawhide preparation for belting, lacing, etc. Mr. R. has been for several years engaged in manufacturing this kind of material the speciality of which is the production of a leather of complete pliability and tensile strength, which is unaffected by exposure or atmospheric changes. The machinery by which this is accomplished is secured to the inventor by letters patent.

**REMARKABLE CHERRIES.**—The branch containing 354 Queen Anne Cherries from Luellen's nurseries, Oregon, exhibited by Dewey & Co., have been looked upon with surprise by visitors in the horticultural department.

**DUTTON'S NEW HARNESS,** which has been tested three months, is spoken favorably of. It avoids the use of the ordinary collar and breast-plate, and is one of the most important inventions of the day.

**THE PRESERVES,** jellies, jams, pickles, canned fruit and vegetables exhibited by P. D. Code & Co., look inviting to the taste. This new firm are making a commendable success of their business in San Francisco.

**THE CAL. BEET SUGAR** is one of the most significant exhibits in the whole Fair. This new product is remarkable for its whiteness and purity.

**HEATH'S DOVETAILING MACHINE** is a California improvement which has worked very successfully at Swan, Dunbar & Co.'s factory, in this city. This firm has run a variety of machinery for making boxes, of which product they exhibit.

**PATENT WINDMILLS AND HORSEPOWERS.** of improved California manufacture, were exhibited by W. I. Tustin.

**SMITH'S TRUSS BRIDGE** was exhibited in model by the Pacific Bridge Co., of Oakland, W. H. Gorrill, President. It has been introduced on this coast during the past year, by the building of several structures, one of which, at Oroville, has a span of 214 feet in the clear.

**GRAPE STEMMER AND CRUSHER.**—Schoenstein & Kline inventors and patentees exhibited one of this new class of machinery, which we would advise persons interested in to examine at their place of manufacture, No. 5 Powell st., S. F.

**A TUCK MARKER,** by John H. Mooney, patentee, is one of the improvements for first-class sewing machines which our lady friends should examine.

## DOMESTIC ECONOMY.

### The Breakfast Table.

A family which has to hurry through breakfast misses a great deal of comfort. If one has to be at business at precisely such a moment, better rise early enough so as to have a leisurely breakfast hour. A cup of coffee is the foundation of a good breakfast—muddy coffee is the misery of a breakfast. The best way to make coffee is to put the coffee into a flannel bag suspended over the top of the coffee pot, and turn boiling water through it. Never let coffee boil except for a moment, as it comes to a boil. A little egg mixed with the coffee before it is put to boil is the best thing to make it clear.

A good beefsteak is a most excellent item in the breakfast bill of fare, if it be broiled. Fried, it is an abomination.

Hot huckwheat cakes or waffles with maple syrup are the felicity of the breakfast hour.

Fried potatoes, if properly served, are a great luxury. The French style of cooking potatoes is the best. Slice potatoes very thinly and wash them. Then drain and wipe and quickly drop them into hot fat. When done turn them into a colander, sprinkle salt on them and serve hot. If you wish them light or swelled, leave them in the colander only about half a minute, then put them back in the fat. If the fat is very hot when dropped into it the second time, they will swell.

Omelets and broiled ham make a nice breakfast.

Hammered biscuit are a nice special dish for breakfast—very popular in the South. A lady gives the following receipt for making them:—With a quart of flour rub thoroughly a heaped tablespoonful of lard, add cold water or sweet milk enough to make a very stiff, dry dough; work and beat it an hour and a half. Some people say give three hundred blows with a mallet. When it blisters or pops it is ready for the oven. Bake carefully until biscuits are a light brown.

On this question of eating, Dr. W. Hall says that it is not wise to eat by rules made in the chemical laboratory, or in the study of the philosopher. Eat what you feel like—that is, partake in moderation of what is most palatable to you; but if in rare cases it is found that what you are most fond of is followed by disagreeable results, gracefully yield to nature, and avoid it for a while at least.—*Ex.*

### Hints for Housekeepers.

To drive biting bugs, pass through the room with a hot shovel on which some brown sugar has previously been placed.

For fruit stains on napkins, table-cloths, etc., pour hot water on the spots—rub in hartshorn or oxalic acid dissolved in hot water.

Never rub soap on flannel. Make a suds by dissolving the soap in warm water. Rinse in warm water; very cold or hot water will shrink flannel. Shake them out several minutes before hanging to dry. Blankets can be washed in the same way.

A hit of glue dissolved in skim milk will restore crapes.

Ribbons of every kind should be washed in cold suds and never rinsed.

If your flat irons are rough, rub them with fine salt and it will make them smooth.

A hit of soap rubbed on the hinges of doors will prevent their creaking.

Scotch snuff put in holes where crickets come out will destroy them.

Strong lye put in water will make it as soft as rain water.

Half a cranberry, it is said, hound on a corn, will soon kill it.

If you want to keep "posted" in matters pertaining to household duties generally, read this page of the *RURAL* every week.

**HOW TO MAKE COMMON HARD SOAP.**—Put in an iron kettle five pounds unslacked lime, five pounds soda, and three gallons of soft water; let it soak over night; in the morning pour off the water, then add three and a half pounds of grease, boil till thick, turn into a pan until cool, and then cut in bars.

**CLEANING TINWARE.**—An experienced housekeeper says the best thing for cleaning tinware is common soda. She gives the following directions: Dampen a cloth and dip in soda and rub the ware briskly, after which wipe dry. Any blackened ware can be made to look as well as new.

### To Preserve Citrons.

Citrons, well prepared, constitute excellent sauce. Pare off the outer skin of citrons, and cut them into quarters. Take out the middle. You may divide each quarter into several pieces. Lay them four or five hours in salt and water. Take them out, and then soak them in spring or pump water (changing it frequently) till all the saltiness is extracted, and till the last water tastes perfectly fresh. Boil a small lump of alum, and scald them in the alum water. It must be very weak, or it will communicate a very unpleasant taste to the citrons; a lump the size of a hickory nut will suffice for six pounds. Afterwards simmer them two hours with layers of green vine leaves. Then make a syrup, with half a pint of water to each pound of loaf sugar; boil and skim it well. When it is quite clear, put in the citrons, and boil them slowly, till they are so soft that a straw will pierce through them without breaking. Afterwards put them into a large dish, and set them in the sun to barden.

Prepare some lemons, by paring off the yellow rind very thin, and cutting it into slips of uniform size and shape. Lay the lemon rind in scalding water, to extract the bitterness. Then take the pared lemons, cut them into quarters, measure a half pint of water to each lemon, and boil them to a masb. Strain the boiled lemon through a sieve, and to each pint of liquid allow a pound of the best double refined loaf-sugar for the second syrup. Melt the sugar in the liquid, and stir into it gradually some beaten white of eggs; allowing one white to four pounds of sugar. Then set it over the fire; put the lemon peel into the syrup, and let it boil in it until quite soft.

Put the citrons cold, into a glass jar, and pour the hot syrup over them. Let the lemon remain with the citrons, as it will improve their flavor.

If you wish the citrons candied, boil down the second syrup to candy height (that is, till it hangs in strings from the spoon), and pour it over the citrons. Keep them well covered.

You may, if you choose, after you take the citrons from the alum water, give them a boil in very weak ginger tea, made of the roots of green ginger if you can procure it; if not, of race ginger. Powdered ginger will not do at all. This ginger tea will completely eradicate any remaining taste of the salt or the alum. Afterwards cover the sides and bottom of the pan with vine leaves, put a layer of leaves between each layer of citron, and cover the top with leaves. Simmer the citrons in this two hours to green them.—*Western Rural.*

### Examine Your Teapots.

A caution has lately been largely copied in the domestic columns of newspapers to the effect that cracked dishes, after being long used for holding gravies and fat of any kind, become rancid and unwholesome. And later comes another, with good medical authority to back it, against using tin vessels—more especially teapots—which have become rusted or blackened inside. The acid contained in the tea, combines with the iron of the exposed portions of the vessel, and forms a chemical compound, not unlike ink. It corrodes and darkens the teeth, and cannot be inoffensive to the stomach. I have seen the discoloration, both of natural and artificial teeth prove so obstinate, from this cause, as to require several scourings with soap and ashes, with a stiff brush, to remove it.

When housekeepers hear any of the family remarking, "This tea tastes like ink!" it is time to examine—possibly to throw away—the teapot.

The most palatable and wholesome tea is made by steeping in a bright tin or porcelain cup, then pouring into a freshly scalded earthen teapot. Thus treated it will never acquire the astrigent quality so deleterious to the teeth and to health.—*Ohio Farmer.*

**FILL YOUR LAMPS IN THE MORNING.**—Scarcely a week passes but we read accounts of frightful accidents from kerosene lamps exploding and killing, or scarring for life, men, women and children. A simple knowledge of the inflammable nature of the liquid may put a stop to nearly all the accidents. As the oil burns down in the lamp, inflammable gas gathers over the surface. When the oil is nearly consumed, a slight jar will inflame the gas, and explosion follows. If the lamp is not allowed to burn over half way down, accidents are impossible.

### Domestic Receipts.

**BROWN SOUP.**—One pound of turnips, one pound of carrots, half a pound and six ounces of onions, one and a half pints of peas, four ounces of butter, and half a pound of bread. Cut the vegetables into small pieces; put them in a pan with the butter; cover the pan, and let them stew over the fire till brown, occasionally stirring them; put in the peas, with the water in which they were boiled; add sufficient boiling water to make three quarts altogether; next add the bread, which should be browned or toasted before the fire, but not burnt; season, and let the soup boil gently for three or four hours; rub it through a coarse sieve; return it into the pan; let it boil, and it will be ready to serve. If dried peas are used, they should be steeped for twenty-four hours in soft water, and boiled for two hours.

**TO MAKE PICKLES HARD USE ALUM AS FOLLOWS:**—To a gallon of vinegar add one ounce of powdered alum. If the vinegar is put into bottles tightly corked and set in a kettle of cold water, with hay or straw between them to keep the bottles from knocking together, and allowed to remain over the fire until the water boils, then removed and kept in the kettle until nearly cool, the vinegar will keep perfectly clear when used for pickles, but it should be added to them cold. Shreds of horseradish root will prevent all pickles from moulding.

### Mechanical Hints.

**HOW TO CLEAN CHROMOS.**—In answer to numerous inquiries, *Prang's Chromo* says: "When you clean them, use a soft brush, or wipe them with soft chamois skin, (a drop of oil may restore clearness,) or with a fine linen rag very slightly dampened. Always tenderly. Next, whenever the original varnish coating is dulled, bruised or rubbed, revarnish it with thin mastic varnish. Chromos, like oil paintings, should not be hung in a dark room, but in one with diffused light, and never exposed to the direct rays of the sun. The chromos, after water colors, keep and display better when plated under glass, as they lack the protecting cover of the varnish. The larger chromos, after oil paintings, display as a general rule, best when framed like original paintings. It is not necessary to put any of these under glasses; it is a matter of taste—preserving them, at the same time, from dust and rough handling.

**PLATING AND GILDING WITHOUT A BATTERY.**—A very useful solution of silver or gold for plating without the aid of a battery may be made as follows: Take one ounce of silver, dissolved in one quart of rain water. When thoroughly dissolved, throw in a few crystals of hyposulphite of soda, which will at first form a brown precipitate, but which eventually becomes re-distilled if sufficient hyposulphite has been employed. A slight excess of this salt must, however, be added. The solution thus formed may be used for coating small articles of steel, brass, or German silver, by simply dipping a sponge in the solution and rubbing it over the surface of the article to be coated. I have succeeded in coating steel very satisfactorily by this means, and have found the silver so firmly attached to the steel, (when the solution has been carefully made) that it has been removed with considerable difficulty. A solution of gold may be made in the same way, and applied as described. A concentrated solution of either gold or silver thus made, may be used for coating parts of articles which have stripped or blistered, by applying it with a camel-hair pencil to the part, and touching the spot at the same time with a thin clean strip of zinc.

**TO MAKE ARTIFICIAL MARBLE FOR PAPER WEIGHTS OR OTHER FANCY ARTICLES.**—Soak plaster of Paris in a solution of alum; hake it in an oven, and then grind it to a powder. In using, mix it with water, and to produce the clouds and veins, stir in any dry color you wish; this will become very hard, and is susceptible of a very high polish.

**INVISIBLE CEMENT.**—Isinglass boiled in spirits of wine will produce a fine, transparent cement, which will unite broken glass so as to render the fracture almost imperceptible and perfectly secure.

**TO LOOSEN SCREWS AND BOLTS.**—When you find screws and nuts have become fast from rust, pour on them a little kerosene or coal oil, and wait a few moments until they become soaked with the liquid. When this is done they can be easily started and the bolt saved.

## LIFE THOUGHTS.

THERE is no fool like the man who accounts himself wise.

MISERY dwells with the miser, but he follows the footsteps of the spendthrift.

THOUGH the sky rains chickens, they must be roasted before they are good for the table.

A FRIENDSHIP that makes the least noise is often the most useful; for which reason I should prefer a prudent friend to a zealous one.

PRIDE may sometimes be a useful spring-board to the aspiring soul, but it is much more frequently a destructive stumbling block.

ATOMS—A mountain is made up of atoms, and friendship of little matters, and, if atoms hold not together, the mountain is crumbled into dust.

SINCERITY is speaking as we think, believing as we pretend, acting as we profess, performing what we promise, and being what we pretend to be.

LOVE.—With love, the heart becomes a fair and fertile garden, with sunbined and warm hues; and exhaling sweet odors; but without it, it is a bleak desert covered with ashes.

### A Secret.

There are a great many persons who can not tell why it is they have so much difficulty in getting and keeping positions in business. If they are in business, they easily drop out; if they are out, they find it hard to get in. If they have a position to day they may lose it to-morrow; if they lose their place, they perhaps have to wait weeks and months before they secure another. They do not comprehend that while others are busy they should be unwillingly idle; that while others have as much as they can do, they have nothing to do.

There is a little secret, that will go far to explain the difficulty; there is a constant unsupplied demand, in all departments of labor, for skill, and it is those who possess this property that easily secure and retain situations, while those who possess it not, are forced to be idle. There is all the difference in the world between an expert clerk and a clumsy one—between a skillful salesman and an unskillful one—between a dexterous mechanic or laborer and an awkward one—between even a cheerful, and tidy house servant, and a careless, slovenly one. The value of skill applies to all vocations, and all departments of service. Whether a piece of work is well done or ill done may be a question of vast importance to the employer; it may be worth twice as much to have it well done, as to have it badly done.

A good workman may be worth twice as much as a poor one; an expert reliable clerk, who attends to his employer's business, as well as the employer himself would, may be cheap at two hundred dollars a month, while a careless clerk, who is not concerned how he does his work, so he gets through with it and draws his pay, may be dear at half the sum. A young man, with a good education, twenty-five years old, and of some experience, may imagine that his services are worth as much as another man of the same education, age, and experience; but he may be seriously mistaken in his estimate. His value is to be submitted to an employer for an estimate, and the qualities skill, tact, diligence, fidelity, and trustiness, are all to be considered in determining it.

If one man possesses the attributes in a high degree, and another lacks them, the former is sure of constant employment at liberal compensation, while the latter may be a large portion of his time out of employment, or able to command only an inferior salary. Labor is sometimes a glut in the market, but skill and efficiency are always in demand; if, therefore, a man who has always services to sell, would get a good price, and constant employment for them, let him, by diligent study and careful application, make himself master of his calling, whatever it be.

STICK TO ONE THING.—Every young man, after he has chosen his vocation, should stick to it. Don't leave it because hard blows are to be struck or disagreeable work to be performed. Those who have worked their way up to wealth and usefulness do not belong to the shiftless and unstable class, but may be reckoned among such as took off their coats, rolled up their sleeves, conquered their prejudices against labor, and manfully bore the heat and burden of the day.

## Business Cards.

**JOHN ROACH, Optician.**  
Has removed from 522 Montgomery street to  
510 Washington street,  
East of Montgomery.  
Surveying Instruments made, repaired and adjusted  
22v17-3m

**E. J. FRASER, M. D.,**  
SURGEON,  
No. 108 Stockton street, S. F., Cal.

**Farmers and Mechanics**  
**BANK OF SAVINGS.**  
No. 225 Sansome Street.  
Interest paid on Deposits. Money Loaned on Real Estate.  
H. DUTTON, President.  
GEO. M. CONDEE Cashier. 19v16-3m

WM. BARTLING. DENNY KIMBALL.  
**BARTLING & KIMBALL,**

Paper Rulers and Blank Book Manufacturers.  
505 Clay street, (southwest cor. Sansome),  
SAN FRANCISCO.  
15v12-3m

**SAN FRANCISCO**  
**CORDAGE COMPANY.**

Manila Rope of all sizes. Also, Balo Rope and Whalo  
Limo constantly on hand. Muling Ropes of any size  
and length manufactured to order.  
TUBBS & CO., Agents,  
611 and 613 Front street.

**SAN FRANCISCO MILL.**  
**HOBBS, GILMORE & CO.,**  
Manufacturers of Boxes,  
Market Street, bet. Beale and Main.  
For sale—Mahogany, Spanish Cedar, and other Woods.

**JOSEPH GILLOTT'S**  
**STEEL PENS.**  
Sold by all Dealers throughout the World.

**J. F. PAGES,**  
**SEAL ENGRAVER,**  
**AND LETTER CUTTER.**  
Brass and Steel Stamps and Dies, 608 Sacramento street,  
San Francisco. Orders by express promptly attended to.

**L. SCHUMANN,**  
**PIONEER**  
**Meerscham Pipe Manufacturer,**  
No. 311 KEARNY STREET.  
Between Bush and Pine streets, San Francisco.  
The first and only Manufactory on the Pacific Coast.  
MEERSCHAUM MOUNTED WITH SILVER. Meerscham  
Pipes Baked and Repaired. Amber Mouth-pieces Fitted.

**The Merchants' Exchange Bank**  
**OF SAN FRANCISCO.**  
Capital, One Million Dollars.

LEVI STEVENS.....President.  
R. N. VAN BRUNT.....Cashier.

**BANKING HOUSE,**  
O. 415 CALIFORNIA STREET.  
25v20-47

**INTERNATIONAL HOTEL,**  
San Francisco, Cal.

This Favorite House is located on Jackson street, a  
few doors west from Montgomery; offers the greatest in-  
ducements for Families. The International Coach will  
be at each Car Depot and Steamboat, plainly marked In-  
ternational Hotel, to convey passengers to the Hotel  
FREE, and to any part of the city at reasonable rates.

**DICKINSON'S**  
**Patent Shaped Diamond Carbon-Points.**

Diamond and Carbon, shaped or crude, furnished and  
set for Dressing Mill-Burrs, Emery-Wheels, Grindstones,  
Conglomerate, Drilling Rock, Sawing or Working Stone,  
Tracing up Hardened Steel, and for other mechanical  
purposes. Also Olaziers' Diamonds. See Scientific  
American, July 24th, Nov. 20th and 27th, 1869; Engi-  
neering and Mining Journal, Jan. 7th, 1871; Journal of  
the Franklin Institute, Philadelphia, June, 1870. For  
Circulars descriptive, and Prices, send stamp to  
apl5-6m **J. DICKINSON,** 64 Nassau St., N. Y.

**DANA BICKFORD'S**  
**NEW IMPROVED FAMILY**

**KNITTING MACHINE.**

**\$1,000 TO \$5,000 A YEAR, AGENTS**  
any section of the country, selling Dana Bickford's new  
and improved FAMILY KNITTER. This Machine is  
guaranteed (in its present completeness) to meet every  
want of the household for either domestic or fancy work.  
Price \$25. Send for circular and illustrated book.  
Address **DANA BICKFORD,**  
Vice-President and General Agent, 639 Broadway, N. Y.

## STEPHENS &amp; CO.,

MANUFACTURERS OF

**U. S. STANDARD BOXWOOD AND**  
**IVORY RULES.**

ALSO EXCLUSIVE MANUFACTURERS OF

**L. C. Stephens' Patent Combination Rule.**

This cut represents the COMBINATION RULE, which  
comprises a Foot Rule, Spirit Level, Try Square, Bevel,  
Plumb, Slope Level, Etc.

It is made of the very best quality of Turkey Boxwood,  
heavily bound with brass, and is graduated with mathe-  
matical accuracy.

The Square is adjustable, and can be tested and made  
perfectly true by the aid of a small screw-driver, but  
this is seldom required.

In its application as a Slope Level it is especially  
adapted for Miners' use, as it shows the PITCH TO THE  
FOOT, and DEGREE OF INCLINATION at once. It is six  
inches long when folded, by one and three-eighths wide,  
and three-eighths inches thick, the cut being just one-  
fourth size.

By the use of one of these, a builder, mason, car-  
penter, or other workman, can always have in his pocket  
the most valuable of his apparatus used in construction,  
combined in a portable, useful and cheap form.—"Scienti-  
fic American."

Price by mail, prepaid, \$4. For agents' terms, address  
**STEPHENS & CO.,**  
Riverton, Conn.

## DENSLOW &amp; BUSH'S "SAFETY" OIL

**SAFEST OIL KNOWN.**  
Will Not Explode!  
Stands a fire test over 150°  
Fahrenheit. We take ordi-  
nary Kerosene 10° fire test,  
and re-distill it by our new  
process, re-selecting fully 3/4  
Benzine and Tar, the cause  
of all Kerosene explosions,  
bad odors, smoke, gas, etc.  
Our "SAFETY" OIL costs 1/4  
cent per hour, and a lighted  
lamp may be upset and broken  
without fear of explosion  
occurring. The Fire Underwriters of N. Y. recommend its use  
as a protection to life and property. For sale by all grocers,  
druggists, etc., in the U. S. Extra inducements to dealers  
and agents. Address **Denslow & Bush,** 130 Maiden Lane,  
N. Y.; 8 Custom H. street, Boston, Mass.; 24 S. Calvert  
street, Baltimore, Md.; 51 S. Water street, Chicago, Ill.; or  
Cleveland, Ohio. P. S.—5 gallons expressed for \$3 to any  
place where not for sale. 2v23t

The Great Equivalent.—The world may be safely  
challenged to produce so perfect a simulation of any  
thing in nature, as

Tarrant's Seltzer Aperient

Is of its original, the Seltzer Spring of Germany. The  
Aperient, based on a correct analysis of the Seltzer  
Water, is even superior to the manufacture of Nature  
herself, because it contains all the active medicinal  
properties of the spring, unalloyed by any of the inert  
and useless particles found in all mineral fountains.  
THE GENUINE ARTICLE BEING EXHAUSTED, you have the  
Seltzer Water of Europe, purified and perfected, and  
probably the best, the most genial cathartic and anti-  
bilious preparation on the face of the earth.

SOLD BY ALL DRUGGISTS.

### BAD LEGISLATION.

From one stand point, whatever legislation encourages and fosters the agricultural, mechanical, and manufacturing industries of the State, and adds to the general prosperity of the country, we call good.

On the other hand, that legislation, the tendency of which, is to discourage these industries, and retard the country's prosperity, must necessarily be bad. England owes her superiority, as a manufacturing and commercial country, to her judicious legislation for the encouragement of these great industries.

France became one of the first silk producing countries in the world under the fostering care of favorable legislation.

Among our own States those that have given the greatest assistance and encouragement to agriculture, manufacture, and the mechanical arts—whether directly or indirectly through agricultural and mechanical organizations, are to-day in the enjoyment of the greatest degree of material prosperity.

The present condition of our own State requires a careful system of legislation on these subjects. We looked to the last Legislature with strong hopes that they would comprehend our wants—the wants and necessities of the laboring and industrial classes; but that Legislature seems to have been extremely unfortunate in this respect. Every statute that had been placed upon the statute book by previous Legislatures, with a direct reference to these objects, was by the last Legislature repealed, and those having an opposite tendency enacted in their stead.

For instance, in 1862, an act was passed for the encouragement of agriculture and manufactures in California. This act offered small premiums for the successful production of sugar or molasses from beet root, sorghum or cane; for flax, hemp, cotton, tobacco, hops, raw silk, tea, coffee, rice, and many other new and strictly agricultural products. It also offered premiums for many articles of manufacture new to this State, but which ought to be manufactured here, and could be, if properly encouraged. The encouragement of such industries has the effect to draw money from the banks and put it in general circulation among the people—the laboring class of the country; to stimulate enterprise, experiment, and invention; and to add to the general life and prosperity. The amount of premiums offered are generally trivial, compared to the increased taxable property thus brought into existence; and practically it is generally found that the increased taxes collected much more than pay for the premiums called for.

The Lottery bill is another instance of bad legislation. To say nothing of the immoral tendency of this legislation, which of itself should have condemned it, the effect on the industries of this State has been very bad. It has drawn not much less than three millions of money from circulation among the poor and working classes throughout the State, and concentrated it in the large towns and cities. It has taken it from the many, in small sums, and given it to the few, in large sums, without any exchange of consideration passing between them. It has drawn this large amount of money directly from the productive industries of the country—from the farming, mechanical, and manufacturing operations, and employed it in non-productive operations, in games of chance, which have not only been of no benefit to the country or to individuals, but a great damage to all.

The direct operation of this law has been to make the rich richer, and the poor poorer. Legislation in reference to the material industries should always be directed so as to induce the active employment of capital when it will give employment to

labor, and beget habits of frugality and industry among the laboring classes. The tendency and direct result of the legislation above mentioned, has been wholly the reverse of these—to concentrate the money in the hands of the few and to beget habits of recklessness and indifference. There were many other laws passed by the last Legislature, having the same tendency; but we will consider them at another time.

### South Africa Diamond Fields.

The special correspondent of the New York *World* writing from Du Tait's Pan, South Africa diamond fields, June 15th, says:

Du Tait's Pan, situated 20 miles south of Puiel, is turning out to be the largest and richest camp in the diamond district of South Africa. There are at least 15,000 white persons and 5,000 colored, making a population of 20,000 men, women and children, working at Du Tait's Pan and adjoining farms, De Been's and Bulfontein Diamonds are being dug out every day of from 1-16 to 20 carats in weight, and once a week one of over 50 and up to 100 carats in weight is turned out. Last Friday three diamonds, each weighing over 20 carats, were found at De Been's from three adjoining claims.

#### A Nest of Diamonds.

A man named Neniemer has taken out forty diamonds, weighing 150 carats, from his claim. The hole that he has worked out is only about six feet wide and fifteen feet long and an average of ten feet deep, finding diamonds all the way down, the largest a twenty-three carat gem. Rawstone, my last year's partner at Phiel, purchased the adjoining claim for £110, and turned out an eight-carat gem the next day. I have started three companies working at Bulfontein and Du Tait's Pan, and last week they found nine diamonds. Two of the parties I have started walked up from Cape Town—600 miles. They have found two diamonds so far. Two other Americans, who have the adjoining claims, have taken out an eight and a seven and a quarter carat diamond in two weeks; being defective, they were worth only £100 (\$500) but that will do for a month's work, and only one-tenth of the claim worked out.

#### A 55 1-8 Carat Stone Worth \$75,000.

America beat them all last week. Mr. J. B. Hopkins, from Lockport, Pa., came to South Africa two months ago, and last Monday, the wind blowing so hard, causing thick clouds of dust so that no one could remain in their claims. Hopkins meandered out from camp and over the plain, and observing some garnets shining on the ground about a mile and a half from camp he dropped on his knee and elbow, and picking one up commenced to scrape for more, when a bright point came to view. Scraping under this, out popped a magnificent 55 1/8 carat diamond, octahedron, flawless and speckless, of that peculiar straw color that is fashionable in England, and worth in the United States at least \$75,000. When it made its appearance Hopkins was paralyzed for a moment, and the diamond could have been taken from him without his having power to prevent it. He and I are partners now, and on the 4th of Sept. we leave for America, via Cape Town and England, with over \$100,000 worth of beautiful rough diamonds of all colors, shapes and sizes.

#### Americans on the Field.

There are about twenty Americans on the fields at present; their Post office is Klip Drift, South African Diamond Field. The names that I can remember are as follows: Isaac Sonnenburg who has a store at Jacobsdal and Du Tait's Pan, Dr. Blake and wife, Wm. C. Mills, F. B. Rickers, J. B. Hopkins, J. L. Bahe, C. C. Campbell (who has brought me in a five-eight carat diamond just found); Mr. Lindley, Charles Timmis, Major Bedee, Mr. Smith, Mr. King, Wm. Burns, Mr. Walker, Mr. Parrish, Mr. Marshall, Dr. Winn, Mr. Sinclair and Mr. Baker—the three latter are near here with a steam engine and a sugar dyer, to be used in diamond sifting. As wood is exceedingly scarce and dear (\$20 a cord) they will not do much with their engine, I am afraid.

#### Farms—Wells—Prospects.

The farms have all been opened at 10s. 6d. a claim per month for mining; the Orange Free State Government take 5s. of this tax and the proprietors of the farms the balance. Wells have been sunk at different places throughout the camp, but have not struck water. In the "Pan" water was struck, but it was very salty. The dam is getting very low, and water is now being hauled from a fountain five miles off. These mines will most undoubtedly last

for years, and there is working room for at least 100,000 people. It is becoming the general impression among geologists who are here, that this whole plain, 200 miles long by 100 in width, is the true matrix of the diamond.

#### The Town of Du Tait's Pan.

A town has been laid out at Du Tait's Pan, and around the public or market square numerous wooden and iron stores, hotels, billiards and whisky saloons and bowling alleys are being built. Saturday afternoon is devoted to auctions, of which there is half a dozen going at once. Provisions are cheap, and are auctioned off every morning by the market master in the square. California long-handled shovels are in demand, and can't be obtained; they would sell readily at from \$10 to \$15 each. There is a colonial duty on them; I do not know the amount, but I think 11 per cent. The weather is splendid, rather cold in the mornings and hot at noon.

#### Thoroughbred and Full Blood.

These terms are often misapplied, when used as synonymous. Every thoroughbred is a full blood; but every full blood is not a thoroughbred. Thoroughbred means in and in breeding, as does full blood; but the former means something more than that—it means in and in among the best of an identical kind—through and through the best of the best. Full blood may be simply through and through, with the same race, without regard to selection. Hence full blood is not or may not be thoroughbred; while thoroughbred must always of necessity be full blood. Sufficient care is not observed in making this important distinction.

**RAPIDLY SETTLING.**—The U. P. R. R. in addition to their through "Express," through "Mixed," and through "Freight" trains, have lately added a "Colony" accommodation, which leaves Omaha at 5.45 A. M., stopping at all stations, and arriving at Grand Island, 145 miles distant, at 4.30 A. M. Returning, leaves Grand Island at 5 A. M., arriving in Omaha at 3.40 P. M. This speaks in thunder tones for the settlement of the country. The rush of emigrants and colonists to settle along the line of this road this season has been enormous—far exceeding all others since the completion of the road. And well they may, as the lands for 200 miles west of Omaha are equal to any in like geographical position on the American continent. Yet it was only a few years since the "Red Man," in all his gentle ferocity and winning ways, dispossessed their possession inch by inch with the hardy pioneers, and the buffalo, antelope, and other game roamed over them in countless numbers. How wonderful the change—great is the "Iron Horse" and the "Union" is his prophet.—*Croft's Trans-Continental Guide.*

#### How to Dry Plants.

The inquiry is often made as to the best method for drying plants for an herbarium. The process is very simple. The specimens to be pressed should be collected when free from dew or other moisture, and spread upon a sheet of blotting or other absorbent paper, on the third page of the paper. The leaves and flowers should be spread very carefully, so as to show the structure and perfect shape of each. When the plant is thus arranged, the paper is folded together so that the second page rests upon the plant, and after a number are arranged, the whole may be placed in a pile and subjected to a slight pressure for a few days. It is not well to place the plants upon single sheets of paper, because they are very liable to disarrangement and injury. After the plants have become perfectly dry, they may be removed from the blotting paper, and placed between sheets of paper, and if desired may, be affixed by touching the under side of the stem and leaves with a drop of mucilage. When practicable the whole plant and root should be preserved.

THE CONTRA COSTA GAZETTE office, at Pacheco, entirely destroyed by fire on the 5th, will be restored with new type next week. Messrs. Bunker & Porter have not only made the *Gazette* a first-class country paper, but given it a higher reputation as a journal of influence and progress, and we hope and trust to see it prosper anew.

FRUIT FROM HEALDSBURG.—Healdsburg is shipping large quantities of fruit to San Francisco. So much for the railroad.

### Special to Inventors.

All inventors who secure valuable patents through the SCIENTIFIC PRESS PATENT AGENCY are specially favored with a liberal notice of the merits of their inventions in the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS—two first-class weeklies, the most widely circulated of any on this coast, reaching the very best classes for the benefit of our ingenious citizens. In many cases we know that such notices have been worth more to patentees than the whole cost of obtaining patents. While we give the most able and experienced counsel to inventors, our terms are more favorable to Pacific Coast inventors than those of any other Agency in the United States, besides the benefit derived from having their inventions set forth rightly in the start by gratuitous publication in more than one highly reputable journal.

### Trade Mark Patents for Merchants and Manufacturers

Can now be secured to advantage under the NEW LAW

In the United States. Parties interested will be furnished with all information desired, and have their application intelligently prepared and promptly forwarded to the Patent Office, and their patents secured in good time, by DEWEY & CO., U. S. and Foreign Patent Agents, No. 414 Clay street, S. F.

**INVENTIONS AND PATENTS.**—The brain of the inventor is constantly at work devising improvements in the modes of mining and the reduction of ores. Three inventions have originated in Austin, viz: The Stetefeldt and Bankert furnaces, and feeding and other mechanical contrivances by Mr. Standish, of the Manhattan mill. All these inventors secured their patents through the agency of Messrs. Dewey & Co., publishers of the San Francisco SCIENTIFIC PRESS, who never fail of giving satisfaction. Aside from their thorough knowledge of all the forms necessary in the securing of patents, the accurate drawings and extended descriptions of patents confided to them, in the columns of the SCIENTIFIC PRESS, are of immense benefit to the inventor, for they bring their inventions to the direct notice of that portion of the public which has an interest in new discoveries. Every mining community should patronize the SCIENTIFIC PRESS; and we learn with pleasure that Mr. Murray, the traveling agent of Messrs. Dewey & Co., has added a large number of Austin subscribers to his list.—*Reese River Reveille, Austin Nevada.*

Mr. Wm. H. MURRAY, special corresponding agent for the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS of San Francisco, arrived in Elko on 1st Wednesday, and is still engaged as usual in the interest of the two excellent papers mentioned, and we are glad to learn that he has been meeting with gratifying success. Mr. Murray comes here from the eastward, having just completed an extended tour through Utah and Colorado. He is here to visit the Railroad District, and from thence will go to Mineral Hill, Eureka and White Pine. Having canvassed those mining regions, he then proposes to inspect Cope and wend his way through Idaho. Mr. Murray has also been exerting himself in the interest of the great Industrial Fair to be held in San Francisco on the 8th instant, and hopes a good showing of minerals of Nevada will be made. Contributions of minerals and metals from the mines of Nevada will be given a prominent place and will be labeled, and will attract attention and capital to our mines. Wells, Fargo & Co. will forward, free of charge, all packages addressed to the Mechanics' Institute, care of J. H. Gilmore, San Francisco.—*Independent, Elko, 5th.*

THE RURAL PRESS.—Believing as we do that every farmer in our valley would be well repaid for the expenditure of a few dollars in procuring a good paper specially devoted to the agricultural interests of the Pacific Coast, we commend the PACIFIC RURAL PRESS as the best one within our knowledge for the purpose. Any of our subscribers desiring a specimen copy can have it by application at this office, and in a club with this paper, subscription can be had at reduced rates.—*Independent, Inyo Co.*

PLACERVILLE, Sept. 1, 1871.

MESSRS. DEWEY & Co.—Gentlemen: I am happy to acknowledge the receipt of my Letters Patent for my Self-Generating Gas Burner; and for the manner in which you conducted the case, I will say that it is entirely satisfactory; and I can assure you that I will recommend others to you who have Patents to obtain.

Yours respectfully, C. B. BROWN.

THE San Francisco SCIENTIFIC PRESS of July 29th has a well written communication from Mr. Murray, its agent, giving a truthful description of Golden and its resources. In connection with it is a sectional cut of our coal beds, which is an important accompaniment. The PRESS is an excellent paper, and is doing much in the dissemination of knowledge of our growing west.—*Transcript, Golden, Col.*

IN COLORADO.—Mr. W. H. Murray, special agent and correspondent for the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS of San Francisco, left copies of his journals when he was here, and judging from these numbers, much valuable information regarding irrigation and mining can be obtained by reading them. The interests of California and Colorado are identical, and the people should become more acquainted with each other.—*Greeley Tribune, Colorado.*

Send us Communications.—They will be respected. If you have not time or the experience to write finished articles, send us facts brief and plain. We will take care of them. Remember that writers improve themselves with others by use of the pen. Officers of societies, clubs and meetings, please report.

Volume One of the Pacific Rural Press can be had at this office for \$3. Bound, \$5. A few copies only for sale now.

READERS will favor advertisers by mentioning the information gained from notices in our paper.

## Premium for New Subscriptions.

There are many persons not familiar with the value of the Press who would ever after be thankful to our present subscribers for bringing their names on to our list of intelligent readers. Large additions can be made with little effort by the many in this way. We therefore offer (post paid) a premium of one of the patent newspaper file holders (advertised in this paper) for every two new subscriptions received with \$8 advanced payment.

## The Largest and Best in America.

## The Scientific Press,

Established in 1860, is now the Largest, Most Original, Best Illustrated and most Ably and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of fresh intelligence in a condensed and interesting style, easily appropriated by the reader, who finds its columns replete with new facts and ideas not obtainable in the books of the past or in any one other of the journals of the day.

Varied in its carefully compiled and conveniently arranged departments, representing the special and leading industries of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvements and Inventions—it becomes a weekly informant to all Scientific, Mechanical, Manufacturing and Industrial Progressionists on the coast, an immense list of whom testify to its pleasant, profitable and elevating influence.

The progress of our journal has been steady and unvarying. Encouraged by a liberal class of readers who exhibit their appreciation in a substantial way, we shall, with our increasing facilities, experience and information, make each coming issue superior to its predecessor.

Let every friend of Science and Industry on this side of the continent take pride, not only in sustaining, but accelerating the advancement of a faithful representative of its highest interests by subscribing for it and urging its patronage by others—now, without delay.

Subscription \$4 per annum, in advance.

Address

DEWEY & CO.,

Publishers and Patent Agents, 414 Clay St., S. F.

UNIVERSITY OF CALIFORNIA.—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book Keeping are taught.

Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TAYLOR, Oakland, Master Fifth Class.

SUCCESS IN BUSINESS.—Success in the business world usually depends upon being thoroughly prepared for its duties. Young men! If you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24 Post street, San Francisco. This is the only school on the Pacific Coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book-keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which cannot be discussed here. Call at the College and examine its workings. If unable to send for circular, and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address E. P. HEALD, President, Business College, San Francisco, Cal. 10723p-3m

THE REMARKABLE PROPERTIES OF BROWN'S BRONCHIAL Troches have been thoroughly tested since first introduced. The demand for them has steadily increased; and purely upon their own merits they have found favor with those who, from Pulmonary, Bronchial, or Asthmatic complaints, require them. For Coughs and Colds they are efficacious.

N. Seibert's Eureka Lubricators for steam cylinders are acknowledged by all engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not rust or gum, and will pay for themselves in a short time, in the saving of oil, over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First street, San Francisco. 8v23p-3m

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 15 Dearborn street, Chicago, Ill. 23v11-2mbp

LADIES DESIRING TO PURCHASE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 294 Bowery, 157 E. 26th, 477 9th Ave., New York Good work at high prices if desired. 21v11-2mbp

Opera Glasses, Pebble Spectacles, and Eyeglasses, in great variety, wholesale and retail. C. MULLEN, Optician, 205 Montgomery street, Russ Block, San Francisco. 7v23-3m

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

## Our Printed Mail List.

Subscribers will notice that the figures found on the right of the printed slips, represent the date to which they have paid. For instance, 21v10 shows that our patron has paid his subscription up to the 21st of September, 1870; 4j73, that he has paid to the 4th of January, 1873; 4j73, to the 4th of July, 1873. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction. Please notify us if you are not properly credited within two weeks after paying.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by sending their names in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

W. H. MURRAY—General Traveling Agent.  
TALBOT P. POWERS—Solano and neighboring Counties.  
L. N. HOAG—Sacramento, General Agent.  
E. M. SHAW—San Diego.  
L. P. MCCARTY—California.  
T. W. DUGLASS—California.  
M. W. LEVY—Denver, Colorado.  
M. B. STARR—Pacific Coast.  
THOS. POYER—California.  
WM. J. CLARK—California.  
JOSEPH DIMMICK—California.  
E. P. HICKS—California and Oregon.  
A. C. KNOX, City Soliciting and Collecting Agent.

SUBSCRIBERS should send former address, when ordering the paper sent to a new place. Retaining a newspaper or blank slip, without the NAME and RESIDENCE of the subscriber is a thoughtless act, and useless both to subscriber and publisher.

THE RURAL PRESS.—We have received in exchange the RURAL PRESS, published by Dewey & Co., San Francisco; also the SCIENTIFIC PRESS. For the former no better paper exists in the State, and the latter is invaluable to the mechanic. They are both most ably edited. We regard the PRESS as one of our best exchanges. —Mendocino Herald, Ukiah, Sept. 30th.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

## Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

## Alameda Coal Mining Company—San

Francisco and Alameda Counties, State of California. Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 7th day of September, 1871, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately. Any stock upon which said assessment shall remain unpaid on the 3d day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 30th day of October, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

M. PHILLIPS, Secretary.  
Office, 409 Battery street, San Francisco, Cal. se104w

## Bellevue Mining Company—Location of

works, Ophir District, Placer County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of August, 1871, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately. In United States gold coin, to the Secretary, at the office of the company, 409 California street (up stairs), San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 3d day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 23d day of October, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

T. F. CRONISE, Secretary.  
Office, 409 California street, San Francisco, Cal. se24w

## Jeinsen Lubricator Company—San Francisco, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 1st day of August 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.

## CHOLERA.

## HOW TO CURE IT.

At the commencement of the Diarrhea, which always precedes an attack of the Cholera, take a teaspoonful of the Pain Killer in sugar and water (hot, if convenient), and then take freely the stomach and bowels with the Pain Killer, clear. Should the diarrhea or cramps continue, repeat the dose every ten or fifteen minutes until the patient is relieved. In extreme cases, two or more teaspoonfuls may be given at a dose.

The Pain Killer, as an internal remedy, has no equal. In cases of Cholera, Summer Complaints, Dyspepsia, Dystentery, Asthma, it cures in one night, by taking it internally, and bathing with it freely. Its action is like magic, when externally applied to Old Sores, Burns, Scalds, and Sprains. For Sick Headache and Toothache, don't fail to try it. In short, it is a PAIN KILLER.

Directions accompany each bottle.

The Pain Killer is sold by all dealers in Medicines.

Prices, 25 cents, 50 cents and \$1 per bottle.

## Phelps' Patent Animal Trap,

FOR GOPHERS, SKUNKS, RATS, CATS, CAYOTES, and other "Varmints."

This Trap, as may be seen, is of simple construction, and not likely to get out of order, and very durable.

It is Very Efficient

and can be used conveniently by women or children. THE CHEAPEST AND BEST YET INVENTED. Price 50 cents. By mail, prepaid (to places where express charges are high), \$1. A liberal discount to clubs or dealers who buy by the dozen. Address the Inventor and manufacturer, D. N. PHELPS, al-1y-awp San Leandro, Alameda County, Cal.

WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchaser shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbag," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation.  
For further particulars address

FERMAN R. WILSON,

San Francisco.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION:—D, is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricator for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the election of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. 14v15-tf

**THE PATENT  
Novelty Mill and Grain Separator**

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Orass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.  
For further information apply to  
R. STONE,  
25v22-3m 421 Battery street, San Francisco.

**Varney's Patent Amalgamator.**

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they  
have no equal. No effort has been, or will be spared,  
to have them constructed in the most perfect manner,  
and of the great number now in operation, not one has  
ever needed repairs. The constant and increasing de-  
mand for them is sufficient evidence of their merits.  
They are constructed so as to apply steam directly  
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces  
the pulp to the center, where it is drawn down through  
the aperture and between the grinding surfaces.—  
Thence it is thrown to the periphery into the quicksilver.  
The curved plates again draw it to the center, where it  
passes down, and to the circumference as before. Thus  
it is constantly passing a regular flow between the grind-  
ing surfaces and into the quicksilver, until the ore is  
reduced to an impalpable powder, and the metal amal-  
gamated.

Settlers made on the same principle excel all others.  
They bring the pulp so constantly and perfectly in con-  
tact with quicksilver, that the particles are rapidly and  
completely absorbed.

Mill-men are invited to examine these pans and settlers  
for themselves, at the office, 229 Fremont Street,  
San Francisco.

## Designing and Engraving

By the Best of Artists,  
At this Office.

## To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

### To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it. Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., SCIENTIFIC PRESS OFFICE SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS 112 illustrated mechanical movements and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAWS of 1870.

## AUTOMATIC STEAM VACUUM PUMP.

Our engraving represents one of the Patent Automatic Steam Vacuum Pumps, manufactured by the Aetna Iron Works of this city. The construction of this pump is simple, and the expensive features of the complicated and heavy low-pressure pumping engine are wanting. It consists of a single hollow cylinder containing no piston or other mechanism. Attached to the top of this cylinder is a steam pipe and small chamber, and to the bottom of said cylinder, valve chambers are affixed, containing plain "flap" valves, opening or closing ports, through which the water is received and discharged in the same manner as in a common pump. These valves by means of light, simple connections, serve to operate all the other moving parts of the apparatus, thus making the pump completely automatic. The receiving, discharging and steam pipes are connected to the cylinder in substantially the same manner as in ordinary pumps.

After setting the pump into position the cylinder is filled with steam and the same instantaneously condensed, thereby forming a vacuum in the cylinder; after this the operation is as follows: water is forced by the atmosphere through the lower receiving pipe, filling the cylinder from below, while at the same time a small quantity of air is admitted through a small opening above the water; immediately the vacuum is supplied, steam is admitted in a thin sheet on the top of the air, compressing the same, and forcing the air and water downward, the latter escaping through the discharge pipe.

There is no condensation of steam by this operation, air being one of the best non-conductors of heat known, and, as it is about twice as heavy as steam, the latter lies upon the top of the air, and this stratum of air acts in all respects like a piston to separate the steam from the water, and yet transmits the pressure, and does it, it will be observed, without friction, waste or condensation.

As soon as the water is forced out of the cylinder, the steam supply is shut off. The steam (remaining in and filling the cylinder) is condensed, a vacuum again created, and the operation repeated; it only requiring a steam pressure of one pound to raise water a distance of thirty feet. The amount of water to be raised in this way depends only upon the size of the apparatus.

The cylinder and valves, and also the slight machinery connected therewith, are of the most durable construction, and the composition of the same is such as to adapt them for all services.

This pump embodies in a simple hollow cylinder, with but few pipes, simple valves and light valve rods, all the important features of the heavy complicated low-pressure engine. Its special merits are economy in fuel; quietness of operation; simplicity of construction, thereby rendering it easy to repair; no packing required, there being no piston; no loss of

power in overcoming friction, there being no intermediate machinery between the power and effect; no damaging effect of sand, salt, or sediments. This was the only pump that received a diploma at the 8th Industrial Fair in San Francisco. For further particulars address Jno. O.

## LOSS OF QUICKSILVER.

EDS. PRESS:—With yourselves, and no doubt many of your readers, I am desirous of obtaining more data as to the loss of quicksilver in our quartz mining operations. That there is a great lack of inter-

that which experience and a little time can give, and when it cannot be a draft on "professional property." The question now is, the *Loss of Quicksilver*. Is the greatest loss in silver mining, per ton of ore worked, or per ounce of silver extracted?

How is it in gold mining? What is the loss per ton by the various modes of working? Now to get at the facts of all this, I make the following proposition to the miners of the several States and Territories; that I will constitute myself a medium for the reception of all statements that parties may desire to forward, and when 25 respond, I will go to work to compile them, make as good an article as possible, and publish the same for the benefit of the mining community, with comments. Parties at the same time they state their loss, should also give the character of ore, as well as chemicals used, whether working gold or silver, pans or plates, working dry or wet, with or without fire. It must be clear to all, that much could be thus gained for each other's enlightenment. I will venture the assertion that there are not ten mill men in either this State or Nevada, who know clearly what should be their legitimate loss, under proper care of their subordinates, from the fact that it has not particularly been a subject of close investigation.

They may know what they lose, but they do not know how much of that loss may be attributed to a lack of skill in the use of chemicals or carelessness, of manipulation.

That the loss can be brought considerably within what it now is, in most mills, I am sure of, and an interchange of ideas can be made "to pay," as that is the sense in which things must be put, in these latter, degenerate days.

There must be a wakening up to the point of more economizing, in all our mining operations or we had better quit mining; for thus far, disguise it as we may, taking into consideration all the capital put into the business, the mills built and ore worked, mining as a business in the past has been a failure, and it all arises from the fact that there is too little care taken in getting the metal out, too much wastage of both the gold and silver, with the quicksilver; for in wasting mercury, more than its value in the precious metals goes with it. Men in manufacturing pursuits "save the piece," but in mining the "pieces" go down stream by millions. In the 21 years that we have been mining on this coast, taking the loss of mercury with the loss of the precious metals, full \$1,050,000,000 have gone to waste!! Are we sensible miners to allow this to continue?

All who choose to respond can address,  
ALMARIN B. PAUL,  
No. 318 Cal. St., Room 1, San Francisco.

**FIRE IN THE MINING TOWNS.**—Fire has been making serious ravages among our mining towns in the interior lately. Last week Pioche City, Nevada, was nearly destroyed and a number of valuable lives lost, and now we are called upon to chronicle a similar calamity in Virginia City. The latter was substantially built, and well provided with apparatus for the extinguishment of fires; but all effort seemed to be unavailable in this instance. A meeting of the citizens of Hamilton, Nev., was held, this week, to make arrangements for the relief of the Pioche sufferers, and over \$1,000 was subscribed. Something should also be done for the burnt-out people of Virginia.

PATENT AUTOMATIC STEAM VACUUM PUMP.

Hanscom Aetna Iron Works. San Francisco, Cal.

**LOW WATER.**—The streams are unusually low all over the State, seriously hindering mining and milling operations almost everywhere. Probably the rivers have never been lower than they now are since the first occupation of California by the people of the United States. The same complaint reaches us from across the Sierras. The streams in Idaho are lower than ever before known. The Boise river, at last accounts, was one foot lower than at this time last year, and was still falling.

THE bean crop on the lower coast is pronounced a failure for this season.

est, or a great amount of carelessness among miners, is evinced from the fact, that no one seems to respond to legitimate enquiries with what might be instructive and valuable answers. I feel conscious of having done my part, to help the mining interest along, by not being particularly tight laced in throwing forth any facts which might be turned to profit by any one, and all certainly would like, as well as yourselves, to see more public spirit among operative mill men. By an exchange of ideas much is to be gained and many errors corrected.

To lock up one's experience is a public injury, especially when the public seeks

## MECHANICAL PROGRESS.

### The Westfield Explosion—Differential Expansion.

Among the mass of testimony submitted during the recent investigation into the causes of the explosion on board the steamer Westfield, none perhaps has attracted more general attention among educated and practical mechanics than the unequal expansion theory, advanced by Mr. Norman Wiard, a gentleman whose ability as a mechanic is well known. The force exerted by unequal expansion is evidently not fully appreciated by mechanics generally; and quite too little attention is paid to this matter in the construction, setting, and management of steam generators. The theory of Mr. W. is not confined to mere speculation; but is founded upon numerous and carefully conducted tests.

According to this theory no boiler is safe, under any practical degree of pressure, unless the conditions of differential expansion are fully recognized and provided for in the construction and management of boilers. To substantiate the truth of this assumption the case of the mysterious explosion of a boiler at Grand Rapids, Michigan, is adduced, which at the time of the explosion contained neither water nor steam, and from which the man-hole plate had been removed; but from under which the fires had not been completely removed.

If any one desires to test this theory and determine approximately the force exerted by differential or unequal expansion, it can be done without the use of a boiler. An old car wheel or pulley will answer the purpose. Place the rim so that cold water may trickle freely upon it, while the flame of a spirit lamp is introduced into the eye. The result will satisfy the most skeptical experimenter, provided he places himself out of the way of the flying fragments which will be violently projected by the explosion which is sure to follow. If the wheel or eye be large, perhaps two or three small flames might be required. Car wheels have been known to burst from this cause, without the aid of water or flame—the catastrophe being sometimes hastened by the slight tap of a hammer on the rim in “trying” them. The frequent bursting of lamp chimneys and globes is another familiar illustration of the force of unequal expansion, occurring sometimes when hanging in their places or snugly laid away upon a shelf; but oftener when subjected to sudden currents of air while heated by the flame of the lamp.

**HAMMERING AND SQUEEZING PUDDLED IRON.**—An Eastern journal says that in several of the iron mills where the Sellers hammer is employed, puddled balls are squeezed by being placed on the anvil and subjected to the powerful pressure of steam admitted above the piston. The squeezing saves much metal which would fly off under the blow of the hammer, or which would be crumbled off in the rotary squeezer. When the ball is compacted by pressure, it is patted and then hammered. To this statement the reply is made that very many practical men claim for the rotary squeezer that puddled iron that is unfit for sale is detected by its use; that the iron would be “crumbled off” by passing through the rotary squeezer, is not fit to reach market through the manipulation of any other machine or process; that the unskillful workman (puddler) is known from the good one, and, that supposing the balls from the puddling furnace to be all of a size when subjected to the squeezer or hammer, and reduced to the same size by either, that the cinder is as thoroughly ejected by the one as it is by the other.

When the rotary squeezer was first introduced, it was urged against it that the iron would not be as good as if reduced by the “solidifying process of the hammer,” but it is now pretty well understood that a small amount of hammering or squeezing preliminary to a much greater amount of rolling, does not much effect any great dif-

ference in the quality of the finished iron. Iron that requires to be “patted” is made from a common stock, or is insufficiently puddled, and to be sure would not stand the test that a rotary squeezer would subject it to. We here speak of iron made for general use; iron of a first class quality for rails frequently passes through the squeezer in a very unsatisfactory manner.

### Art in Metal Work.

We have often remonstrated against the incongruous character of our metal work. Here there is a comparatively untrodden path of art. Cast and wrought iron work are extensively employed in building. These are as capable of artistic treatment as the brick or stone building with which they are incorporated. Generally, however, they are either covered up, or else made in the forms of stone architectural features, as though metal were something to be ashamed of; as though it had no properties that did not suggest life and beauty in artistic design, allowing the metal to appear, and making its use, strength and appearance forcible; marking and emphasizing it in the building; and, instead of hiding it, or making it appear like some other material, giving it a definite design and character of its own. Thus, by its force and contrast, it would very greatly add to the effect of the building where it was employed. There is no exception in the case. All kinds of purposes for which metal is used in buildings might be marked and emphasized by artistic treatment. How much less of sameness and tameness would there be if this were done, and how much greater would be the artistic feeling and force so very desirable. There is a great scope here, and until more is done in this department there is something wanting.

The employment of zinc for external cornices and canopies is coming into vogue. Setting aside the question of durability, why is it not possible to treat the material artistically as metal? What is the necessity of making it appear like stone? Even with a design resembling the treatment of stone, it looks far better with its glossy, natural color, as metal, than when smeared and deadened with paint not at all in accordance with its nature.—*American Builder.*

**TREATMENT OF STEEL.**—Mr. Howell, in the *Journal of the Society of Arts*, says that steel plates, especially such as are intended for ship building should as soon as possible after their manufacture, be submerged in boiling linseed oil. Plates thus coated have been found after three years' exposure to the weather, to exhibit not the slightest tendency to corrosion, though subjected to alternate wet and dry. Mr. H. considers that the life of the plates will be lengthened greatly by this process, and that the plates will take paint much better for it. It is most important, too, that destructive oxidation should be avoided as much as possible. The newly formed oxide arising from the heat of the furnace does not decay until exposed. The oxide formed on steel plates in the fire is much more tenacious than that formed on iron, and forms more completely part of the plate, being very difficult of removal.

Another point of importance urged by Mr. Howell, which, however, is generally acknowledged, is the desirability of having the drill used instead of the punch in perforating the rivet holes in steel plates.

**THE MANUFACTURE OF CHINESE GONGS.**—The secret of the manufacture of Chinese gongs is said to have been recently discovered by M. M. Julian and Champion, who have found that bronze which is brittle at ordinary temperature becomes malleable at a dull red heat. The makers of bronze implements of ante-historic times, were evidently aware of this fact, as also were no doubt the manufacturers of the bronze lamps, etc., found in Pompeii and other buried Italian cities. Some experiments have been made at the Paris mint with the view of determining the conditions most favorable to working such alloys, and it has been found that a bronze containing 20 per cent. of tin, which is as brittle as glass at an ordinary temperature, may, at a dull red heat, be forged and beaten out as readily as soft iron.

**ANGLE STEEL.**—not angle iron,—is a new article of manufacture, designed to take the place of angle iron in the construction of safes. Its advantages for the purpose, over iron, is apparent.

## SCIENTIFIC PROGRESS.

**RUST.**—It is well known that when iron is exposed to the action of pure dry oxygen, no oxidation or rusting occurs. It is commonly supposed that moisture is the essential condition to the oxidation of iron; but a series of carefully-conducted experiments have shown that iron is but slightly oxidized in pure moist oxygen, but if to this is added a trace of carbonic acid, the oxidation takes place rapidly. The experiments alluded to substantiate the interesting fact that carbonic acid is the real promoter of oxidation. Long ago, Berzelius, and other chemists observed that caustic alkali prevents the oxidation of iron. It is now established that carbonates and bicarbonates possess the same properties as their hydrates. If an iron blade is half immersed in a solution of an alkaline carbonate, it exerts such a preservative influence on that part of the bar which is exposed to an atmosphere of common air, which always contains carbonic acid, that it does not oxidize after a period of two years. Similar results were obtained with sea-water to which had been added carbonates of potash and soda.

**THE EMPLOYMENT OF INDIGO.**—Until within a few years indigo was thought to be insoluble in almost all reagents which did not decompose it; but the increasing extent of its employment rendered the discovery of new solvents a matter of much moment. Recent researches, in efforts to meet this want, have disclosed several new agents in which it can be dissolved, and from which solutions it crystallizes on cooling. The *Chemical News* says that hot aniline dissolves indigo, forming a solution from which, on cooling, the indigo crystallizes in beautiful coppery spangles. Venetian turpentine, also, heated to its incipient boiling point, is a solvent for indigo, which, after cooling is readily purified by the aid of ether or alcohol. Boiling paraffine also dissolves indigo, and can be readily removed after cooling, by means of benzole. Spermacetti, stannic acid, chloroform and petroleum are also said to be more or less perfect solvents for indigo.

**A NEWLY INVENTED RAIL.**—Letters-patent have been taken out for a new rail for railroads, which promises to do away with the continual rattle and jar of railroad travel. It is a continuous T rail for which the inventor and those who have examined it claim important advantages over any rail now in use. The rail is in two sections, the upper section lapping over the lower and fastened there by horizontal bolts. Between the sections is india rubber packing, five-eighths of an inch in thickness. It is thought the use of this rail will prove important in many respects and be much cheaper in the end than those now in use. The upper section may be made either of iron or steel, and when worn out can be laid without disturbing the under section.

A great expense will thus be saved in relaying the track. The india rubber packing will give the car an easy and almost noiseless motion, and prevent the sharp concussions which so frequently result in the breaking of the axles. The saving to rolling stock will be an item of very great importance, and will commend the use of the improvement to all companies that study economy as well as safety.

**COLORS ELECTRIC LIGHTS.**—M. E. Becquerel has shown that the electric spark may be diversely and beautifully colored by being made to pass through saline solutions. If an electrical spark from an inductive apparatus be made to pass into the extremity of a platinum wire suspended over the surface of a solution of a salt, this spark will acquire special coloration according to the chemical composition of the solution traversed. The saline solutions are best concentrated, and the platinum wire positive. The experiment is readily performed in a glass tube. Salts of strontia will color the spark red; chloride of sodium, yellow; chloride of copper bluish green, etc. The light from these sparks, analyzed by the spectroscopic, furnishes a method for the determination of the nature of the salts contained in the solution.

**PSYCHIC FORCE.**—Mr. Coleman Sellers, of Philadelphia, well known as an able mechanical engineer, and who is also an amateur prestidigitator of unusual skill, in a brief article in the *Franklin Journal*, throws considerable doubt over the genuineness of the manifestations of “Psychic force,” lately announced by Dr. Crookes, and supported by Mr. Huggins, and others.

Mr. S. thinks the condition for excluding the possibility of facilities for sleight-of-hand, and other related descriptions, were not so thorough as they should have been.

He compares the floating accordeon to the acknowledged trick of Hermann's floating wand; and suggests the possibility of ventriloquism to account for the music.

He thinks the statement that the strip of “mahogany board, 36 inches long by 9½ inches wide and one inch thick,” with three pounds suspended in the balance and (by assumption) three (an equal weight) on the table, making a total weight of only 6 pounds, rather a loose report, when the books and practical experience show that such a board ought to weigh about 13½ pounds. Such an apparent mistake he thinks must detract from the general reliability of the entire series of experiments.

**ORIGIN OF GRAPHITE.**—Prof. Wagner ascribes the deposits of graphite, plumbago, or black lead, which are found in a great variety of rocks of different geological periods, to the decomposition of cyanogen, which is a combination of carbon and nitrogen, or of the cyanides. In several chemical processes, used in the arts, graphite is formed artificially; and it is not impossible that this extensive mineral, the best specimens of which are now brought from the island of Ceylon, may be produced artificially in such quantities as to be made available in several branches of manufactures where this mineral is indispensable. Chemists, however, have not yet accepted Prof. Wagner's explanation, or any other, as to the natural production of graphite.

**DEATH BY DROWNING AND COLD.**—Dr. Richardson has shown, amongst other experiments, that fish that would be presumed to be dead from what he called “glacial death,” were easily recoverable. Death from drowning under ice is one of the most rapid of deaths, and is completed with so quick an extinction of consciousness as to be actually painless. The heart retains its power of action, the blood remains fluid, and the muscles keep up their irritability for a long time after apparent dissolution; and so favorable are all the conditions for renewal of living action, even for two hours, that a considerable advance in the practice of resuscitation must follow upon further careful and laborious experimental research.—*Lancet.*

**A NEW LIGHT.**—Dr. Harcourt, of Paris, proposes a new system of illumination. He reduces ordinary illuminating gas by admixture with a certain proportion of atmospheric air and then brings up its illuminating power by allowing the flame to impinge upon platinum-sponge. The result is said to be an increased light with less expense.

**THE SUN SPOTS.**—Prof. Daniel Kirkwood has determined, as he thinks, that the period of the sun-spot cycle is gradually lengthened—it being a variable and not a constant figure; and he draws from this fact the conclusion that the cause of this phenomenon is not to be sought in the influence of the planetary bodies, for this influence, being constant, would preclude any variation in its effects; but it must be sought in some purely physical cause operating upon the sun's body.

**ANOTHER SIMPLE TEST FOR STEEL AND IRON.**—Mr. H. A. Walker, of Tarboro', N. C., proposes that the scintillation of iron and steel filings, when put in a fire, be made of use to test the quality of the metal. The different degrees of brilliancy, as well as the readiness with which the filings sparkle in the fire, are suggested by Mr. Walker as proofs of the varying purity of the iron or other metal. The test is handy and convenient, and might be of practical value.

# CORRESPONDENCE.

## EAST CANON, OPHIR DISTRICT, U. T.

BY OUR OWN TRAVELLER.

[Continued.]

EDS. PRESS:—Near the city of Ophir the different smelting works are all in operation day and night, and the business is a thriving one. The furnaces of Schofield, Abbey, Drake & Co., known as the East Canon Smelting Works have been running since the 10th of July, and reduce about 10 tons of ore per day. The owners are new to the business but have been successful thus far.

The Brevoort Milling Co., at the lower end of East Canon, has a steam stamp mill, patented by J. W. Forbes of La Porte, Ind., which cost \$2,500 in the East. It is known as the "Automatic Steam Battery," and the mortar is oval in shape, discharging from a No. 40 screen, on all sides. There are two stamps, the stems of which are 6½ feet high, and 65 pounds of steam are required to run them. They use two engines, one of 10- and one of 30-horse power. This mill is run on the same principle as Wilson's stamp mill, so well-known on this coast, the stamp-stem acting as pistons to two vertical cylinders, so that the force of the steam is thrown directly on the stamp. This company also have five improved Varney pans, and one Farnham & Warren patent pulp grinder, with a capacity, it is said, of one ton an hour. The grinder is 30 inches high and three feet in diameter, grinding the pulp three times over, and then discharging it into the amalgamating pans. This is a new enterprise and I shall notice the results with interest, as anything that will reduce the price of milling is of benefit to my particular friends, the miners. A short distance from the cañon is the first quartz mill of any size that was ever erected in Utah. It is known as the

Walker Bros. Mill,

and is under the superintendence of Mr. L. Dunn, a well-known and practical Nevada mill-man. They use 15 stamps, weighing 650 lbs. each, crush day, and have a 75-horse power engine, 2 boilers, each 16x48 inches in diameter, fitted with steam and mud drums, and six pans and three settlers of Varney's improved patent. The pans are four feet eight inches in diameter at the bottom and 26 inches deep, and the millers are the same as in the old Varney pan—a space of four inches being left between them and the staves or wooden sides. The pulp is discharged from both sides of the battery into cars which convey it to the pans. One of Blake's patent rock breakers is also in use, which is calculated to crush 25 tons in 24 hours. On the road near the mill is a large Fairbanks' scale for weighing ore. After passing here the team is driven into the upper story of the ore house, and its load discharged into the basement below, which is five feet above the dry kiln, where the ore is dried preparatory to crushing.

The machinery was all built by Preece & Scherrell, of Marysville, Cal., and shows good workmanship. It is first class, having all the late improvements, and cost, without transportation, \$13,000 in gold. Mr. W. H. Allen, of California, superintended the putting up of the machinery about the engine and pan-room. The millwright was Mr. Jas. White, well-known on the Pacific coast. The dimensions of the building are: battery-room 40x40; pan-room 24x40; engine-room 40x26; retort-room 14x24; and ore-house 40x40. The battery-room is 22 feet high. The mill generally is first class and finely fitted up, having cost \$40,000. It is considered that the dry is much better than the wet process for crushing these base metal ores. There are a few arrastras being worked in the cañon; one owned by J. D. Lomax is run by a water-wheel 18 feet in diameter. He uses also a Wheeler pan for amalgamation. A short distance from Walker Bros. mill, I met an old "White Piner," Mr. G. M. Garrieh, and through his kindness I was enabled to go through the works of the

Ophir Mining and Smelting Co.,

owned by Col. Weightman & Co. There is

one furnace in operation, and a new one is being built. The former is 14 feet from the top to feed hole; 30 inches in diameter at top, 40 in the middle, and 30 at the bottom. They have a 16-horse power engine and a No. 7 Sturtevant blower. About two tons of bullion are made a day; which they inform me is free from dross and very pure. There are three tweers to this furnace. The fire bricks are made of proper shape and are 8 inches thick. It takes twelve to go around the furnaces. Mr. Garrish is a practical man in this line of business and deserves great credit for the successful manner in which he has carried it on.

### Formation of the District.

All or nearly all of the mineral is found in what is generally known among miners as blue line, interlaced with, and containing deposits of white and black calc spar, which is found in the greatest abundance in the vicinity of the chloride deposits. The black spar invariably accompanies the chlorides, and is looked upon by the miners of Lion and Silver Hill as an unfailing sign of their being near at hand. On the base range there is a stratum of red quartzite about 100 feet thick, covered by a heavy body of dolomite shale, which is again covered by the blue lime, extending to the summit of the range. With the exception of this belt of quartzite, etc., the country rock of the district is limestone, stratified, and although several promising veins of ore exist in regular walls, well defined, and having a vertical position, the mines generally occur in strata having the same position as the rock in which they are found.

### Camp Floyd District

joins Ophir on the South and is about six miles distant. The ores are nearly all free, some of the chloride ledges being very extensive and producing large quantities of high grade ore. The Sparrow Hawk and Mormon Chief are the prominent mines in the district, and are attracting considerable attention. A deposit of cinnabar has also been discovered, and specimens have been found running as high as 30 per cent. The mines are being rapidly developed, and a mill will probably be running here shortly. The country rock is the same as that in Ophir, running into a slate or shale to the south as the hills decrease towards the valley.

### American Fork District.

The Miller is the representative mine here, and is doing well. At Forest City there are some furnaces in operation and more are being erected. Timber is plenty, and as a consequence charcoal for smelting purposes is cheap. The ores are of the same character as those in Tintic, the geological formation being the same. Throughout the district times are lively and a large number of men are at work at fair wages. Leaving here we travel a short distance to

### Stockton City,

which is a thriving little place in Tooele county, the same as Ophir district. A hotel is being built here and the place is otherwise improving.

The mines are located about one mile from the city, in the low foothills, and the principal ones are the St. Patrick, Grand Cross, Quandary Lode, and Metropolitan. I rode out in company with Messrs. Murphy & Chase, prominent men in the district, to visit the above ledges. In 1864 the 2d Cal. cavalry under Gen. Connor was stationed about a mile from here, and some of the soldiery while prospecting, discovered quartz croppings and made a few locations. They also built some small smelting works, but were unsuccessful in their endeavors. The district is called Rush Valley. The first mine we saw was the

### Grand Cross,

located in 1870. The tunnel running north is in 75 feet and then they follow the ledge by an incline of 20 feet in length. The average width of the lode is three feet, running east and west, with a dip of 45 degrees. The ore is red oxide and galena. The vein, between lime rock and porphyry formation, belongs to Pexton & Sone. The

### St. Patrick

is the representative mine of the district. It is situated on Mineral Hill and was located in March, 1871. There two shafts 200 feet apart, respectively 60 and 70 feet deep. The ledge runs east and west, dips 80 degrees, and averages five feet in width. A force of ten men are extracting ore for the smelting works in the district. The general character of the ore is galena and carbonate of lead, and will assay on the average 63 per cent. lead and \$38 per ton silver. They are taking out five tons

daily, and intend running a tunnel to tap the ledge at a depth of 130 feet. The

### Quandary Lode,

is located in Silver Cañon and belongs to E. C. Chase and others. The shaft is 107 feet deep, and two drifts have been run respectively 20 and 12 feet in length. There are now 25 tons of smelting ore on the dump. The foot wall is lime-rock and the hanging wall porphyry. The first class ore assays 52 per cent. lead and \$30 in silver. It is principally chlorides and gray carbouate. Near by is the

### Great Basin Tunnel,

owned by Gen. Connor. They have run in 80 feet, but are not working at present.

### The Muscatine Lode,

owned by Anderson & Co., is 3 feet wide. The incline is down 30 feet. The

### Metropolitan

ore averages \$40 per ton in silver and 63 per cent. lead. In the first 15 feet the rock yielded \$35, in the next 35 feet it yielded \$65, and when 100 feet down it paid \$80 per ton. The

### Silver King Mine,

owned by Gen. Connor, has a shaft down 240 feet. The ore will yield 60 per cent. lead, and \$40 per ton in silver. The

### Tucson Lode,

owned by Barry & Pardee has a shaft 50 feet deep on a vein 2½ feet wide.

### Waterman's Smelting Works,

are situated about one mile from Stockton City, near the end of the Lake, and are owned by Mr. H. Simone of Philadelphia. These works, erected in May, 1871, have been treating ore from Rush District very successfully. They have a large round furnace for roasting ore before smelting, 12 feet wide at top and 6 feet at bottom. The charges remain in from 3 to 6 days which greatly facilitates the process of smelting. A Gates patent crusher (of Chicago,) is used for breaking ore before putting it into the furnace. The lining of the furnace, which is from 30 to 40 inches in diameter, is made of stone found here, and stands the heat well; all the necessary materials for fluxing are to be found in the vicinity. Nearly 8 tons of ore are smelted daily at these works. The bullion is sent to Omaha and Chicago; but the proprietor says that he would prefer to ship to San Francisco, if satisfactory arrangements could be made with parties in that place. The owner of these works is building another furnace near by, which will be ready shortly. W. H. M.

[Our correspondent has sent us a map of this section of country; but, being incomplete, its publication would be injudicious.]

## Grape Growers' Association of Sonoma, Napa, and Solano Counties.

Pursuant to adjournment, the Association met in Napa city, on Saturday, Sept. 9th, 1871, the President, Maj. Jacob R. Snyder in the Chair.

Present from Sonoma county: O. W. Craig, J. Dressel, Leonard Goss, A. F. Harazthy, J. R. Snyder, A. S. Edwards; from Napa county: G. Backus, Chas. King, J. A. Lockwood, W. W. Lyonau, G. Meliavacca, W. McClure, D. K. Rule, J. J. Siegrist, J. York; from Solano county: H. T. Barker, F. Miester, W. Miester.

The annual election of officers resulted in the following choice: President: J. R. Snyder, of Sonoma; Vice-Presidents: Wm. McP. Hill, of Sonoma, E. D. Keyes, of Napa, and W. Miester, of Solano; Secretary: J. A. Lockwood, of Napa; Treasurer: O. W. Craig, of Sonoma.

Reports from committees being in order, Dr. Rule from a Special Committee on Game Laws, reported a memorial to the Legislature praying for such a modification of those laws, as would withdraw the protection they afford to quail frequenting vineyards.

The report elicited a discussion in which Messrs. Dressel, Craig, Rule and others participated. It was affirmed that the quail and linnet are the most destructive birds to the grape—although grapes are not found in the craw of quail, because they reject the seed and skins. Their depredations cost the grape grower more than the feed of their domestic fowls. The reputation of other birds—bluejay, lark, blackbird, etc., was vindicated. Report accepted.

The Committee on Statistics appealed

for assistance to prepare returns of present vintage.

Mr. King moved the committee be authorized to have printed such forms as may be required.

Mr. Miester objected to the publication of returns that might prejudice the interest of the proprietors.

Mr. Barker opposed the views of Mr. Miester.

Mr. McClure considered that general results need only to be published.

Mr. Goss, in order to remove the objection to giving full returns, moved that the forms should express on their faces that the wishes of grape growers to keep private any information they might give, not intended for the public, should be rejected.

Amendment accepted, and motion carried. Mr. Craig moved that the resolution offered by Dr. Lockwood at the last meeting, respecting coopers and dealers in casks, be adopted, and that the Secretary open a record in the journal, for members to register their purchases of casks, the quality, etc., and that it be the duty of each member to make such records. Carried.

Dr. Rule moved that no cooper be censured on the books of this Association, without a special committee being appointed to investigate the complaint. Carried.

Mr. Harazthy moved that the wages paid to Chinese labor be classified according to their skill, and be made uniform. He would propose one dollar a day for teamsters and cellar-men, and eighty cents for unskilled hands, as pickers.

Mr. Siegrist preferred paying pickers by the job.

Mr. Dressel thought Chinese would not consent to pick by the ton; although, it would be to the advantage of the employer, if they would.

Dr. Rule said a Chinaman would pick one ton a day—a German trained in a European vineyard, would pick from two to three tons.

Mr. Harazthy, who had ample experience in Chinese labor, said their average pick was 1500 lbs. a day; but if Americans and Germans were with them in the gang, to hurry up work, their ordinary pick was a ton each.

Mr. Miester had found a Chinaman would pick one ton—Americans and Germans a ton and a half.

Mr. York had picked ten tons a day with five white men.

Dr. Rule was opposed to fixing a uniform rate for paying labor. He deprecated the principle of laborers' leagues who demanded a certain sum, without regard to the value of their services rendered. He preferred to pay good men high wages, and to kick out the worthless.

Mr. Craig did not believe that vineyardists would be bound by any scale we might fix, and if they did, they would be the sufferers, as he had experienced a year ago.

Mr. Goss, forcibly opposed, at some length, the principle of laborers' leagues involved in this movement. He had been an employee 30 years, and had found all such projects inefficient except for mischief.

Mr. Harazthy had called up the subject at the instance of a local society; but as it seemed to meet no favor with the Association, he withdrew it.

The President asked the attention of the Association to the subject of "Fence laws," and called for the reading of a statistical article he held in his hands. Being read, and briefly discussed, the subject was referred to a committee, to report at the next meeting. Messrs. King, Lockwood and Rule were appointed.

Messrs. E. P. Cutter, A. Gotzchalk and A. Kitz, were admitted as members.

On motion, Association adjourned to meet at Napa city, Saturday, November 11th, 1871. J. A. Lockwood, Sec'y.

THE PHILOSOPHY OF FEEDING.—All the profit in feeding animals, remarks Joseph Harris in *Health and Home*, comes from the food eaten over and above what is needed to sustain the vital functions. With a poor quality of hay a cow is not unfrequently kept through the winter without gaining a pound or giving any milk. She can only eat enough of this nutritious food to sustain the vital functions. But furnish her daily with four quarts of corn meal, and she will either give considerable milk, or, if dry, gain in flesh and fat, and next summer this accumulated flesh and fat will find its way to the milk-pail, and be converted into cheese and butter.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### CALAVERAS COUNTY.

**MINE SOLD.**—Calaveras *Chronicle*, Sept. 16: The Stickles mine, at Angels, has been sold to a S. F. Co. for \$25,000. The shaft in the "Big Mine" is nearly 500 feet in depth.

**GOOD CLEAN UP.**—Champion & Co., engaged in mining in Corral Flat, cleaned up over \$500, the claim averaging nearly \$6 per day to the hand.

**FORT MOUNTAIN.**—Cor. Calaveras *Citizen*, Sept. 16: The Petticoat Mine is now clear of water, and work will be commenced immediately.

In the Wolverine Mine a new shaft was started two months ago, and has been going down rapidly ever since. Good rock has been struck of late in the shaft.

Of Prussian Hill ore over 100 tons are in Randolph's mill, at Railroad Flat, waiting to be crushed, and as much more is yet to come in. The vein is of good size and easily worked.

Mines lying idle are the Lewis Bros., Champion, Invincible, Buckeye, Gopher, Chapman, Pinto, Mary Ann, Pioneer and Sandeumyer & Co.

### EL DORADO COUNTY.

**INDEPENDENCE MINE.**—Mountain *Messenger*, Sept. 50: The sale of this mine has been completed for \$300,000.

**GOOD PAY.**—J. Keuder's claims on Good-year's Creek are now paying from an ounce to \$40 per day to the pick.

### FRESNO COUNTY.

**QUARTZ MINING.**—Millerton *Expositor*, Sept. 15: C. M. Bennett & Co., were to have started up their mill on Monday last. Their mine is situated about 15 miles north of Millerton and south of the San Joaquin, immediately under Table Mt. They are down about 75 feet and have some 50 tons of ore on hand ready for crushing, which will pay from \$10 to \$50 per ton. The mill is run by steam power and has 4 stamps.

### LOS ANGELES COUNTY.

**BULLION.**—Los Angeles *News*, Sept. 16: 200 bars bullion were received yesterday, from the Union Works, Cerro Gordo. The aggregate weight was 16,992 pounds.

### MARIPOSA COUNTY.

**STARTED UP.**—Mariposa *Gazette*, Sept. 15: Wilcox & Catron's quartz mill on Buckeye resumed operations on Wednesday. They have 60 tons of rock to crush, which will average \$70 per ton.

**RICH STRIKE.**—The "John Snow mine," at Sebastopol is still yielding handsomely. The proprietors struck a pocket last Friday from which they realized near \$1,100.

### NEVADA COUNTY.

**LOCATION.**—Nevada *Gazette*, Sept. 15th: Wm. Eddy and others have located 800 ft. on the Coyote ledge, a gold bearing Quartz ledge situated on Coyote Hill about three-quarters of a mile west of the Court house, for mining purposes.

**NEW YORK HILL MINE.**—Grass Valley *Union*, Sept. 17th: A clean up of 19 loads of rock has been made within a day or two at the Gold Hill mill, and the result was 34 ozs. of gold. This gives about \$560 for the 19 loads.

**GOLD TUNNEL MINE.**—This mine, near Nevada city, the first quartz mine in this county worked, and which has been in idleness for many years is again being put shape for working. The tunnels, shafts and such things are being repaired.

### PLACER COUNTY.

**TERIBLY DRY.**—Auburn *Herald*, Sept. 16th:—More than 1,000 tons of rich ore are now awaiting crushing, but the mills are powerless for the want of water.

### PLUMAS COUNTY.

**BY TELEGRAPH.** Sept. 19th: The hoisting works of the Indian Valley M. Co. were burned to-day, at Greenville. The fire extended down the shaft to the third level. The loss is estimated at \$50,000.

### SAN DIEGO COUNTY.

**BULLION.**—There was shipped on Sunday, bullion amounting to \$1,900, principally from the Stonewall mine.

**ITEMS FROM THE MINES.**—The McMechan mill is crushing Golden Chariot ore which looks well. Gunn, Reynolds & Co.'s mill is pounding away on Helvetia day and night. DeFree's mill is also working the same ore. The Stonewall mill has been running six hours a day, having only water enough to keep the machinery going for that time.

The rock averages \$30 per ton, and the mill averages \$20 per hour during the time.

### SOLANO COUNTY.

**FURNACES COMPLETED.**—Vallejo *Chronicle* Sept. 17th: The furnaces for reducing cinabar at the Vallejo Quicksilver mines are completed, and the reduction of ore was commenced yesterday.

### TRINITY COUNTY.

**SILVER LEAD FOUND.**—Weaverville *Journal*, Sept. 16th: Jessop and Ralph have discovered a silver lode in their mining claim near Lowden's bridge. The vein is about 3 feet wide where they struck it, and a small piece of ore assayed \$13.20 to the ton in silver.

**STRUCK IT BIG.**—The Arcade Co. working on Cañon Creek, struck it big last week; 2½ days washing with 4 men paid \$54 to the hand per day.

### YUBA COUNTY.

**BIG CLEAN UP.**—G. V. *Union*, Sept. 16th: The Blue Point Gravel Co. of Smartsville made a big clean up the other day, realizing \$71,000 for a month's run. The Blue Point mine is just beginning to be opened and in a fair way to work.

## Nevada.

### EUREKA DISTRICT.

**CONSOLIDATED CO.**—Eureka *Sentinel*, Sept. 14th: The Co. continues to turn out a large amount of bullion of good quality.

**ROSLIN WORKS.**—The furnace belonging to this Co., is in full blast, and turning out as much hullion and of rich quality as any furnace in Eureka.

**RICHMOND CO.**—Work is being rapidly pushed forward on the two new furnaces; from the 1st day of Sept. until the 11th inst., there has been produced 80 tons of bullion of an average value of \$235 in silver and \$90 in lead, or a total of \$325 per ton, making the gross value \$28,000. This is a product of \$2,800 per day from one furnace.

**CHAMPION.**—This mine, in the Diamond range, has been bonded for a round sum.

**SECRET CANON.**—It is thought that the parties who have bonded the Geddes & Bertrand property will purchase the same.

### ELY DISTRICT.

**BULLION SHIPPED.**—Ely *Record*, Sept. 10th: W. F. & Co., shipped since Thursday last, 22 bars of bullion valued at \$64,795.77, and (same paper Sept. 14th:) since Sunday 21 bars valued at \$26,893.78.

**BULLION ASSAYED.**—John Cahill assayed for the Raymond & Ely Co., for the week ending yesterday, 13 bars of bullion valued at \$41,018.11.

### HUMBOLDT.

**BULLION SHIPMENT.**—Unionville *Silver State* Sept. 16th: The amount shipped from the Arizons mine, since our last issue, was \$5,360.

**SANTA CLARA CANON.**—A fine vein of good milling ore has recently been struck, name of mine unknown.

**A RICH STRIKE.**—The Eclipse M. Co., have been engaged driving a tunnel for some months past, and a few days since reached the ledge, from which ore of a high grade is being extracted. Three feet of the vein has been taken out, with no signs of the upper wall. The tunnel is 240 ft. in length, and from where they cut the ledge, 125 ft. to the surface.

### REESE RIVER.

**BULLION.**—18 bars of bullion, weighing in the aggregate 1,716 lbs were run at the Manhattan mill yesterday; and nearly every day for the last week, 4,000 to 4,500 lbs of amalgam have been retored.

**GOOD YIELD.**—The last 104 tons of ore taken from the Monitor Mine at Belmont, and worked at the Manhattan mill, yielded upwards of \$54,000.

**ORE FROM THE MONITOR MINE.**—The following is the result of 70½ tons of rock worked within the last few days at the Manhattan mill, from the Monitor mine, Belmont. 24 tons pulp assay per ton, \$936.31 produced \$19,166.77; 8½ tons, assay \$425.34 produced \$3,126.26; 5½ tons, assay \$246.73, produced \$1,125.68; 3¼ tons, assay \$301.08, produced \$7,864.23; 3½ tons, assay \$1,025.79, produced \$3,011.70; average production per ton \$484. Total production of 70½ tons, \$34,297.64.

### WASHOE.

**SAVAGE.**—Gold Hill *News*, Sept. 16th: More Ore is extracted than can be milled; it accumulates in the dumps. Hoisting through the new incline, below the tenth level; will commence soon.

**CROWN POINT.**—The ore breasts at the lower levels continue yielding well, especially at the 900 ft. level. Winzes for air connections are being made between the three lowest levels.

**AMOUNTS.**—The regular monthly dividend disbursed by the Crown Point on last Saturday amounted to \$120,000 and that of the Chollar-Potosi to \$28,000. The August receipts of the Hale & Norcross amounted to \$46,500.

**OVERMAN.**—The hoisting machinery for use at the new Overman shaft, will be completed by the last of this week.

**MINING ACCIDENT.**—A miner in the Yellow Jacket had one of his fingers broken, besides sustaining other bruises and contusions yesterday, by an accidental fall of about 7 ft. in the mine.

**QUINN MINE.**—Virginia *Enterprise*, Sept. 16th: A shaft is down upon the lead to the depth of 50 ft. In the bottom the ledge is four ft. wide and the ore averages over \$200.

The Segregated Belcher M. Co. are making preparations for sinking a new shaft 500 ft. further east than the one at present in use, in hopes of finding the continuation of the rich deposit of ore now being worked by the Crown Point and Belcher Co. on their 1,100 ft. levels.

**ORE YIELDS.**—Last week there was extracted from the Chollar-Potosi 631 tons of ore assaying \$45.22 per ton. The Hale and Norcross yielded 330 tons and the Savage 550 tons, the latter assaying \$33.70 per ton.

The Caledonia Co. yesterday began breasting out and hoisting ore from their 400 ft. level.

**ACCIDENT.**—Pryor, an old miner at the Yellow Jacket, yesterday fell the distance of one set of timbers and was severely injured.

**ANOTHER ACCIDENT.**—A Mexican working at the Ophir mine had his right hand mashed yesterday by a rock falling down the shaft and striking it while it was resting on a car.

The Ione mill, on Gold Cañon, near Devil's Gate, day before yesterday started up on ore from the Caledonia mine. This mine is also supplying two other mills with ore—the Gold Hill Quartz and the Sapphire mill.

**SUTRO TUNNEL.** was yesterday in a distance of 2,421 feet.

**NORTHERN COMSTOCK MINES.**—The Ophir and Consolidated Virginia are now at work to test the lead in two different ways. The Ophir folks have their main shaft down over 1,000 ft, and will put it down to 1,300 before drifting. The Consolidated Virginia are at work at a middle depth, yet with several hundred feet of unexplored ground above them. From their shaft on North F street they have run a main west drift to and through the lode, and from this they have drifted north and south in the vein matter for a considerable distance. From this drift running northward (they have for the present discontinued work on the drift to the southward) they are now raising two shafts. The most northerly of these shafts is within 100 ft of their north line, and the other is 100 ft south or 200 ft. from the line. In the shafts now being raised they are meeting with occasional holders of good ore (assaying from \$40 to \$80) in a species of quartz cement.

**SOUTH CAMP MINES.**—Cor. same: Situated about 12 miles from Shellbrun, on what is known as Ruby Hill. The first location made was the Cow and Calf, sometime in last July, also the "Rattler." The Cow and Calf consists of an immense reef, or ledge of quartz, inclosed in limestone, the quartz carrying mineral throughout, some of it being very rich. The character of the ore is black sulphuret of the "Comstock," and said to be "free as air." The quartz is entirely dissimilar in appearance from anything ever seen in any other district in the State. It is a brownish color and of a shelly nature. The next claim north of the Cow and Calf is the Silver Wreath, on which there is as yet but little work done. In the Rattler's Joy and the Rambler's Luck, some of the ore shows copper glance and stetteldite, etc. They are very rich on top, but undeveloped. The names of the principal locations, exclusive of the above named, are Lookout, Columbus, O'Dare and Starling, Monitor, Lookout No. 2, First North Extension of the Cow and Calf, and the Prospect Shaft.

### WHITE PINE.

**BULLION FORWARDED.**—W. P. *News*, Sept. 10th: W. F. & Co. shipped to-day to N. Y., 8 bars weighing 522 lbs., valued at \$9,270.81, and during last week, bullion footing up the sum of \$55,836.52.

**NORTH AURORA.**—In the Lady's Chamber there are now from 1,500 to 2,000 tons of ore in sight and broken down.

**SOUTH AURORA.**—Contracts have been let to sink three shafts, each 70 ft. deep—one in the Turner drift, one in the Trewelle drift and one in the Hanly drift.

**GREAT WESTERN.**—Drift from upper shaft in 30 ft. in ore of low grade. Lower shaft is down 61 ft., going through a hard cap of lime rock.

**BEECHER CONSOLIDATED.**—Sinking incline in main shaft, in order to take out ore to advantage; 3 drifts now running in ore. Dumps cleaned out and in at mill.

**HEMLOCK.**—Found a fine body of ore. Sinking in Hemlock Chamber.

**WABASH.**—Down 45 feet; good ore in sight.

**GLAZIER.**—Oshorne shaft sinking. Have found a large body of chloride and horn silver ore. Also sinking Miller shaft to strike ore at a greater depth.

**GEN. LEE.**—Running drift on spar seam. Now in 110 ft. Quality of ore improving. The foot wall pitching sharply to the northeast, could not be followed further, as the drift is running on a level, with ore on all sides of it, and prospects of soon developing a large body.

**EAST SHEBOYAN.**—Force of men increased. Work is pushed ahead night and day, in breast and shaft. The breast is now about 16 ft. long, 10 wide, and 9 high with ore throughout the whole face. The ledge is pitching fast into the hill, and becoming more solid. There is a good showing of horn silver in the ore, which resembles Hidden Treasure. The shaft shows 8 ft. of solid ore with a very rich streak between 2 and 3 ft. wide pitching into the hill. This company shipped their maiden brick this week; value \$538.19, proceeds of 12 tons of ore.

**NEVADA.**—Taking out good ore.

**WARD BEECHER.**—The Phillpots shaft is down, connecting with Phillpots chamber. Now hoisting ore from that chamber with the engine. The horsepower has been moved from the whip-shaft and erected on the Risdel shaft of the North Aurora. A large body of ore is in sight in this mine.

**ENERHARDT.**—Work is going on in the Keystone shaft and other portions of the mine.

**GENESE.**—The South Aurora Company is preparing to sink a new shaft from the bottom of the main incline 100 feet deep.

**SOUTH ICEBERG** is taking out very fine ore.

**CASPIAN.**—Situated about 250 yards southwest of the Pocotillo. Incline now down nearly 200 ft., with drift from the bottom in 40 ft.

**SILVER WEDGE.**—This mine shows a marked improvement since last week. A year and a half ago a top deposit of ore was obtained at a depth of 70 feet. In the floor of this ore chamber a shaft has been put down 57 feet—40 feet of the distance in solid limestones. A drift is in 30 feet in a southeasterly direction, toward the main ore channel, where there is good ore. Plenty of ore in the face of the drift.

**TRENCH.**—50 tons of ore from this mine are now at the Monte Cristo mill. It assayed \$325 to the ton; 5 tons per day is hauled from the mine to the mill. It is estimated that there is now \$30,000 worth of ore in sight. Running three drifts with ore in all of them. Ledges from 3 to 6 ft. wide. Working 8 men.

**BALD EAGLE.**—Incline down about 75 ft. Ledge from 4 to 5 feet wide; 125 tons of ore on the dumps that is expected to go \$90 per ton.

**PHILADELPHIA.**—Incline down 8 ft. Ledge going down at an angle of 34°; 50 tons of ore on the dump.

**OUTSIDE DISTRICTS.**—PIERMONT.—Mill running on company rock. Sinking shafts and running main tunnel. Working 22 men. There is a probability that 10 more stamps will be added to the mill.

**SCHELL CREEK.**—Accounts are favorable as to the existence of rich croppings found for a distance of 15 or 20 miles on the Schell Creek range of mountains.

## Arizona.

**ITEMS.**—Prescott *Miner*, Sept. 2d: W. N. Kelley and others have discovered another promising silver ledge. Its location is a little west of the Gen. Crook lode. The silver is contained in galena, assays of which have yielded enormously.

C. Y. Shelton is purchasing animals to run his astras on Upper Lynx Creek. He has, ready for crushing, several tons of Vernon ore, worth, he says, about \$1,000 to the ton in free gold.

To test the Tiger mine thoroughly, for the next 4 months, shafts will be sunk in different places.

## British Columbia.

**DISCOURAGING REPORTS FROM PEACE RIVER.**—An Olympia paper is informed that 400 men returned to Victoria during last week, half starved and ruined in health and purse.

## Colorado.

**BOULDER Co.**—Cor. Central *Reporter*, Sept. 13th: The average of a foot crevice in the "Democrat" and "Brick Pomeroy" veins, Gold Hill Dist., shows over 300 ozs. per ton.

A recently discovered gold lode in the same dist., with a 15-inch crevice, is reported to yield 35 ozs. gold per cord, under stamps. The silver ores are sulphurets, with smaller quantities of argentiferous

ous galena and brittle silver. A great number of lodes are opened to well defined crevices of the most valuable silver ore.

Work is to be resumed on the Trojan, Cardinal Dist. It is leased, we are told, with the expectation of a sale. The main shaft is 80 ft. deep, with better pay in the bottom than was ever taken out above. The vein carries 14 inches of smelting ore, besides 3 ft. of stamp-mill ore, yielding 9 ozs. gold per cord.

On the same hill is the Laramie. The main shaft is down 31 ft., and shows a 4 ft. crevice of rich gold ore, an average of which assays \$70 per ton gold, and also carries silver.

On the hill west is the Corral, opened in numerous places along the whole location, with a great deal of pay ore on the dumps. Assays of ore from the Spotted Jack gave \$800 and upwards, per ton. The main shaft is 28 ft. deep.

The Idaho lode, Cinnabar Dist., is again producing first-class ore, with the appearance that soon the whole body of the crevice will show its former richness. On the same hill the Elephant lode is worked with most satisfactory results. Another lode near by the Monitor has a shaft 62 ft. deep, and a 5-foot crevice of ore.

The smelting furnace of Kearsney, Henderson & Co. will be completed in a few weeks.

W. Pierce & Co. are working the Elgin lode, Caribon hill. The depth is 18 feet showing 5 feet in width of solid mineral, carrying 80 oz. of silver per ton.

The Georgetown is a promising lode on the northern slope of the Caribon hill, and opens with a large amount of the surface ore.

The Caribon Mine, hardly down 200 ft. in its deepest shaft, continues its improvement and has in the bottom a crevice of shipping ore 5 feet in thickness, which averages so high that if we were to give the exact figures they would be deemed incredible.

The Western slope is now down about 45 feet looking first-rate, and is being worked actively. The Blue Bird, idle for several weeks, will be worked with a full force.

CLEAR CREEK Co.—Cor. same: The Stewart Reducing Co. shipped a Silver brick of 60 lbs worth \$1,000 coin.

S. Robertson & Co. on Equator Slide Leavenworth Mt. have struck several veins of rich silver ore, supposed to be a portion of the Compass and Square lode and have commenced working them. The ore is galena and sulphurets of silver, worth from 25 cts. to \$1 per lb. The average in thickness is about one inch. Two men have drifted from this claim in the past month 2,000 lbs.

of first-class ore, worth 600 ozs, silver, and 1,500 lbs. second class ore, worth 200 ozs., about \$1,000 for the month. Below, Mr. Thompson and associates have worked the ground 20x100 feet, and taken from it enough to pay them an average of \$10 per day; they are running a tunnel under this ground.

Bishop, McGlen & Rogers are working Compass and Square lode from the discovery, or a shaft near it. They have been raising one ton first-class ore and one ton second-class ore per month. The first-class runs 1,000 oz. per ton, and the second-class 500 oz. per ton.

The O. K. Lode has a tunnel 90 ft. long that cuts the vein 50 ft. deep. An adit on the vein 100 ft. long on the level of the tunnel has also been run. The main shaft is 116 ft. deep and 30 ft. below the adit a winze had been sunk 35 ft. at the east end of the adit, and has been found a uniform vein of sulphurets of silver and galena.

PARK Co.—Cor. Denver Tribune, Sept. 15: The Moose lode, discovered this summer, has been uncovered for 250 ft. and shows a crevice of ore from 16 to 20 inches in width. The ore assays at the rate of 400 oz. silver per ton. Miller & Fresler have a lode near the Moose that they have opened for a distance of 100 ft; ore is very similar to that in the Moose, and assays about the same.

Gross & Treweek have 3 silver lodes about one mile from Buckskin, that look very promising. The vein in each is 2 ft. wide, and the assay value of the ore is 155 oz. per ton. The Colfax lode has a crevice 20 inches wide, and the assay value of the ore is 215 oz. per ton.

SUMMIT Co.—W. King, has discovered two free gold-bearing lodes in Pollack dist, within the past two weeks.

MCCLELLAND MT.—Minneapolis ore is reported on good authority, to assay over 1,700 oz. silver, per ton. McKinney & Mason are running a prospecting tunnel. Campbell & Hazard are developing the Empire and Silver Crest lodes, close by. Davis & Co. are working the "Masto-

dou," an immenso mineral vein in Peewick dist, southwest from the Sugar Loaf Mt.

WATERMAN is through the cap on the Kansas and now has a 2-ft vein of splendid ore, which, on being raised to the surface, is graded into three qualities. The first assays gold per ton \$405.75, silver \$45.32. The second quality gold \$185.35, silver \$23.49; and third gold \$80.36, and 16.92.

### Idaho.

BULLION SHIPMENT.—W. F. & Co. shipped from here this week 10 bars of bullion, valued at \$16,366.10.

GRANITE CREEK.—Idaho World, Sept. 21: The excitement about quartz in the neighborhood is at a fever heat. T. S. Hart's new quartz mill commenced work Tuesday a week ago, crushing ore from the Lawyer ledge; a sufficient amount of quartz is now on hand to run the mill 10 or twelve months at least. Some 20 or 25 men are at present engaged in the mine and mill.

### Montana.

HENDERSON GULCH.—Deer Lodge Independent, Sept. 9th: Hennessey & Murray cleaned up \$1,600 from 3 weeks' run, with water only 4 hours a day. J. McDermott and C. F. McAndrews have purchased Murray's interest and one-third of Hennessey's, paying \$5,000 for it. Walwork, Terrill & Co., on the bar below, are making on an average \$12 per day, having water all day. O'Connors & Mastison are making from \$15 to \$20 per day to the hand. T. Smith & Co. are making from \$12 to \$15 to the hand. O'Connors & Mastison had their flume robbed (supposed) by Chinamen of some \$300 about 2 weeks ago.

FRENCH GULCH.—S. Garret, informs us that the claim in the main gulch, owned by himself, Birmingham and Louis was lately sold to Chinamen for \$1,500. Lynch, Garret & Co., in Fenian gulch, have been doing well all season. Brownell & Co., in the swamp claim, took out 150 ozs. from the last run of 3 weeks.

WASHINGTON GULCH.—D. Seaton reports that D. Brown lately purchased an interest with L. Flinn & Co. for \$800; also, that Stoner and a few others on the bar are making money.

CABLE.—Mr. Cameron expects to be taking out ore inside of this month. The water is receding in the mine. A drift has been started from another shaft to tap a large body of quartz above the present water level.

VIPOND DIST.—A prospector discovered a very rich ledge last week and has found good indications of another. The Vipond Bros. are taking out rock, which is said to be very rich.

PHILIPSBURG ITEMS.—Helena Herald, Sept. 7th: The 3 stamp battery, erected by Blay, Bell & Co. during the summer, is running but slowly owing to the scant supply of water. Col. Lyon has had a force of men employed in erecting a 5 stamp mill, etc., which will be in running order in a few days. The Trout mine shows a ledge of more than ordinary richness. The Franklin is developing a fine body of good ore. Estell & Holland are working in the Salmon Ledge and have struck richer ore in it than they anticipated.

### Utah.

BULLION.—S. L. Tribune, Sept. 16th: W. F. & Co., forwarded yesterday, of Pioche bullion, 6 bars valued at \$8,082.55, on the 11th; 17 bars valued at \$36,804.41 on the 12th; 21 bars 1,997 lbs valued at \$27,791.36, and on the 15th 6 bars 685 lbs valued \$8,082.55 the latter from Meadow Valley M. Co.

Woods & Co. shipped yesterday, an ore-crusher to the Utah Smelting Co., Birmingham Cañon.

SALE.—One-half interest in the Buckeye and Chadburn mines, Big Cottonwood, was sold on the 29th of Aug. to B. Lyon, W. N. Cowan and Wm. Shotwell, for the sum of \$7,000 cash.

THE FOOTE AND RICE TUNNEL, in the Emma Hill, is being run daily with a full force of men. It is the intention to strike the Emma, New York, and other rich mines that run in a line with this location.

ADELAIDE.—A very large body of ore has been struck, which runs high in silver, and the lode is increasing in dimensions.

WELLINGTON.—A depth of 100 ft. has been reached, revealing a very large body of rich ore.

### Oregon.

By TELEGRAPH.—Sept. 18th: The ditches are approaching completion and the mining prospect is very flattering: 300 men are now at work on the "big ditch."

A \$600 nugget, the largest ever turned out in Baker county, has been sent to the east.

### Mining Stock Market.

THURSDAY EVE., Sept. 21, 1871.

Mining stocks generally have been active this week. On Saturday last there was an increased firmness in Belcher, Kentuck, Overman, and Raymond & Ely, and the week closed with prices firm. The sales in the Stock Board up to last Friday aggregate \$2,188,000. The Raymond & Ely declared a dividend of \$1.50 per share against \$1.00 for last month. The yield of the mine on September account up to the 12th, was \$65,600—equal to \$6,000 per day. The highest average heretofore was \$4,100 per day. Up to Monday the receipts on this month's account of the Meadow Valley mine were \$44,600, and from the Golden Chariot, on same account, \$10,000. The Superintendents of the Raymond & Ely and Meadow Valley mines report no damage done to their respective mines or properties by the recent explosion and fire in their vicinity. The Pioche mine sent down \$12,000 on the 17th inst. At the Crown Point mine 1,400 tons of ore were taken out last week, valued at \$54,500. The last weekly report of the Hale & Norcross mine shows 600 tons of ore extracted and 2,200 tons on the dump. The Savage took out last week 820 tons, averaging \$32.40 per ton. The feature of the Stock Market yesterday was the large sales of Meadow Valley, Pioche, and Raymond & Ely, at improved figures. Stocks were active this morning. Raymond & Ely is still the feature, having an upward tendency, and rising to \$74—an increase of 100 per cent. in a week.

## NOTICES OF RECENT PATENTS.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

**HARVESTER.**—James H. Adamson, Auburn, South Australia, assignor to Rev. Wm. Taylor, Alameda, Cal. This invention relates to an improvement in machines for reaping, dressing, and cleaning grain, and consists of a frame mounted upon suitable wheels, and having a peculiarly shaped comb attached to the front so that it reaps or pulls off the heads of the grain and carries them with the assistance of a set of revolving beaters, into a cylindrical box or case, which extends across the front of the machine just behind the comb and within which the beaters revolve rapidly. These beaters loosen the grain from the husk, by their rapid blows, and, at the same time produce a blast of air which carries the whole up an inclined funnel or chute. The rear end of this funnel is bent sharply downward, and is provided with a series of stout wires below its mouth, between which the grain falls into a receptacle below. The chaff and light straw, guided and supported by the wires, are carried into the large end of a cone, the small end of which opens toward the rear of the machine. This cone is suitably suspended, so that as the front or reaper part of the machine is elevated or depressed, the cone will, to a great extent, retain its relative position with the other parts of the machine and the ground. The interior of the cone is provided with annular ribs, and also with longitudinal vanes, the former to prevent the straw from sliding endwise and the latter to lift it up as the cone is slowly revolved, and drop it through the current of air which passes through the cone. An adjustable screen at the rear end of the cone prevents the wind from blowing the chaff back. The front of the machine is supported upon a steering wheel operated by a lever, and may be elevated or depressed to suit the crop. The comb bar is so connected with the beater shaft that it and the comb can be moved about the shaft, and by means of a sort of parallel motion the front of the comb is held so that the grain will not be lost in descending hills or in lowering the front of the machine.

**IMPROVED HAY PRESS.**—Oscar Bossee, Milbrae, San Mateo Co., Cal. The object of this invention is to provide an improvement in upright hay presses, by which a greater capacity for work is attained with the same force, and it consists in making the chamber higher than the space necessary for the hay. The follower is at the bottom, and an upper rack is brought over the hay when the chamber is full, and secured, the follower being moved up towards it by suitable mechanism, till the hay is sufficiently compressed. The two racks are thus clamped together and the whole is raised to the upper part of the chamber to be tied, while another follower can be placed at the bottom and the work of filling the press can go on again. After the bales are tied, the discharge door can be opened and the bale rolled out either upon a wagon or upon a pile, all lifting being avoided in either case; meanwhile, the follower is removed ready to take the place of the one already in, and the pressing mechanism again connected, so that there is very little delay at any time.

**BLOTTING RULER No. 1.**—Louis Feusier, Virginia City, Nev. This invention relates to a clasp for paper rulers, which is intended to hold a blotting pad in the proper position to dry ink lines after they have been ruled, and thus prevent a further use of the ruler from blotting or spreading the ink. It consists of a thin piece of sheet metal cut and bent to fit the ruler on the underside, and hold a narrow piece of blotting pad, which is inserted into properly formed grooves in the clasp.

**BLOTTING RULER No. 2.**—Louis Feusier, Virginia City, Nev. This invention also relates to a paper ruler with a blotting pad, and is of simpler construction than the one first mentioned, which uses a metal clasp. In this ruler a longitudinal slot is made on each edge of the ruler, and a piece of blotting pad is bent into a shape

to cover the lower face, and its turned over edges enter the slots so that it is secured to the ruler.

**TUBULAR BOILER.**—Oliver Hyde, Oakland, Cal. The object of this invention is to provide certain improvements in that class of steam boilers through which vertical flues or heat passages extend upward from the fire-place, and it consists in surrounding each of these flues with a shell or tube of larger diameter than the flue, so as to form a jacket about it. The outside tubes are open at the bottom to admit water freely into the space around the flue, and are open at the top to permit the escape of the steam which forms quickly and creates a strong circulation and ensures the rapid heating of all the water in the boiler.

## Andrews' Patent Gang Plow.

The accompanying engraving represents the "Plowboy's Pride," invented by Jas. H. Andrews, of Benicia, Solano Co., Cal., the patent for which was procured through the SCIENTIFIC PRESS Patent Agency. The improvement in this gang plow refers more especially to the device for elevating or depressing the plows, as desired.

By referring to the cut it will be seen that there are two foot-boards in front of

ANDREWS' PATENT GANG PLOW.

the driver's seat. The plows are represented as being in the ground, and one of these foot-boards is depressed, as it would be in case the driver was plowing. On turning around or crossing a road or any obstacle, the foot is raised and the pressure put upon the other foot board, by which the plows are lifted by means of the levers shown in the engraving. The construction is very simple, and the manner of working is apparent to anyone who is familiar with the usual means of raising or depressing plows of this class.

These plows are easily worked, of light draught, and adapted to any character of soil. Improvements in implements of this kind are of the greatest benefit to the farmer, and in such a number of varieties as there are extant, everyone ought to be able to choose one to satisfy him perfectly. We doubt whether old Cincinnatus would have left a comfortable seat behind four horses, on a plow like this, with the same readiness that he did his old-fashioned crooked limb, with two handles like a wheelbarrow. His *amor patriæ* would have been more severely tested had he been using one of these plows. Further information concerning this invention, can be had by communicating with James H. Andrews, of Benicia, Solano County, Cal.

THE MOST EXTENSIVE MINING FIRM in the world is John Taylor & Sons, of England, who have mines in almost every quarter of the globe. They are said to give employment to 56,000 men in England alone.

## American Institute Fair, New York City.

BY OUR NEW YORK EDITOR.

Before this reaches the eyes of our readers the great Annual Fair of the American Institute will be open to the public. As in many respects this is one of the most important exhibitions in the Eastern States, we have taken some extra trouble to obtain beforehand some facts in regard to the scope of, the design and the method in which it has been carried out.

## The Building

in which the fair is held is the so-called 3d Avenue Skating Rink, at 63d street and 3d Avenue. It is an immense structure covering nearly a whole block and extending from 3d almost to 2d Avenue. It was built some years since for the purpose which its name indicates. We don't know as it can be better described than by saying that it looks like a three acre lot with an arched roof turned over it. It has about 120,000 square feet of floor surface available for the purposes of the Fair.

## The Arrangements this Year

are far ahead of those of last season. We

breakers and crushers, are also on the list; so also are leather dressing, ornamental carving, glass engraving and blowing, making of gimps, fringes and tassels, washing, fluting and ironing.

Now if a man, woman, girl or boy can go through the Fair and not learn something, we think their capacity for imbibing knowledge, is limited, to say the least. But we must not forget the last on our list, which are working models of engines, locomotives, marine, etc., engraving, and rock cutting by means of the sand blast of which so much has been said by the scientific lights, during the last six months.

Steam to the extent of 200-horse power will be provided, which should be amply sufficient to give every engine dry steam. Among the boilers we notice one of Root's, and one from the Allen Engine Works. Three or four large engines are already partly up.

## Why Some Refuse to Exhibit.

The pump department is pretty well represented, though many of our best makers will not exhibit. This is much too often the case. The best men do not come forward and compete, because they don't like to explain the details and proportions of their pumps for others to take advantage of, and if they don't make all the little refinements public, they stand no better chance than others for the reason that too often, the trials have not been exhaustive in character. There should be tests which should demonstrate the actual economy of each machine. The dollars and cents value of the work done by each pump should be ascertained, which together with the cost of the same, should be the basis upon which to grant the prizes.

In England the Royal Agricultural Society has been carrying on many competitive trials in this way, and has given us some of the most exhaustive tests that have ever been put on record. These faults—in the method, of testing articles for competition have become so great that

## An Entirely New Plan of Awards

Has been adopted. Only one prize is to be given—the grand gold medal of honor. But each machine exhibited is to have a thorough trial and the exhibitor has a report of the same. This will probably give all the advantages of the old system while avoiding its defects.

## California Exhibitors.

Arrangements have been made, we believe, to extend the time for entries from the Pacific slope in order to give time for California exhibitors to bring their goods on after the closing of the Mechanics' Institute Fair, at San Francisco. This opportunity should not be neglected, as it is exceedingly important that all the Pacific slope should be represented. People here are much too prone to forget that the extreme Western States are anything more than mineral in their production. Soon we will say a word or two about the opening scenes and incidents.

**NEW METHOD OF UTILIZING THE SOUTH CAROLINA PHOSPHATES.**—Hitherto these phosphates have been finely pulverized and in that condition subjected to the action of sulphuric acid, in order to render them soluble, and capable of serving as food for plants. This is quite an expensive process, and one which must be managed with much care and skill to avoid an excess of sulphuric acid, which would be very injurious to the soil; while a short supply of acid fails to render the entire mass capable of being utilized by the plants.

Mr. John Commins, of Charleston, near which city these deposits are found, has discovered a new, cheaper and perfectly sure method of preparing the phosphates, without any use whatever of sulphuric acid, and which, if the results are what he claims for them, is certainly a very important discovery. His process consists in heating the phosphates (which occur in round nodules, generally much harder than ordinary limestone,) in a furnace like a limekiln, and when so heated to allow seawater to drip upon them. By this operation the stone is thoroughly disintegrated—like the slacking of lime—and, as claimed by Mr. Commins, placed in a perfectly soluble condition, capable of being readily assimilated by plants. Aside from the simplicity and cheapness of this process, any method by which sulphuric acid can be dispensed with in the preparation of manures should be received with especial favor. It is to be hoped that the discovery of Mr. C. may prove entirely successful.

## What Is To Be.

It will be one of the great objects with the Board of Managers, this year, to make the Fair a source of instruction. In other words we have the school-master in the character of showman. For our life we can't see why he should not take the part if he can do successful teaching that way. Now let us see what he is to teach. As far as practicable, industrial processes are to be exhibited *actually going on*. Among these there are the following:—

Milling of grain. As they can't raise the wheat at the Fair, they have to begin with the grain, but they put it through all the other manipulations, grinding, bolting, making into bread, baking and eating. Planing, sawing and re-sawing machines will be at work. Carpet weaving, blacksmithing, forging, carding and burring, will all be shown. A great power press will be set up and editions of the "Mirror of Typography" and the "Aldine" will be run off—showing people just how the most splendid printing, that the world has seen, is done. The whole of the lithographers, art will be shown in operation, from the preparation of the stone to the printing of a chromo.

Stone sawing, diamond drills, stone

## USEFUL INFORMATION.

## Snakes in Ireland.

Once a Week corrects the common notion that there are not snakes in Ireland, as follows:

"A correspondent informs us that not only do serpents and frogs manage to exist in Ireland, but that they absolutely swarm, the latter especially, in the country districts—notably in the county of Dublin and the Queen's county. But as the snakes are there, and old authorities maintain that Ireland was free from them until comparatively recent times, the fact remains that somebody must have imported them. One account gives it out that they were first propagated from spawn, introduced as an experiment, in 1836, by a Fellow of Trinity College, Dublin; another, that a gentleman imported a number of vipers from England into Wexford, about the year 1797, but they died immediately after. In the summer of 1831, however, a gentleman, by the way of experiment, brought a few pairs of the common snake from Scotland, and placed them in a plantation at Milecross, near Newtonards, and the result was with which they multiplied was more alarming than pleasant. The late Marquis of W—d, well known in his day for his strange freaks, is said to have tried the same experiment on his own estate, but with no success."

**SUN LIGHT THROUGH THE BLINDS.**—Who is there that has not often admired the beautiful little circular forms which sunlight takes when shining through the blinds or any other elongated aperture, upon opposite walls. Some asks the *Herald of Health* why it is that the rays of light take those circular forms rather than forms corresponding to the shape of the opening through which they pass. That journal replies as follows:

All that can be said on this point is that such is the fact. Light thrown off by a luminous body assumes a conical or cylindrical form, according to the conditions under which it appears to the observer. All pencils of light are primarily diverged from every point of a luminous body throwing off light in a conical stream; converging rays and parallel rays are generally regarded as having a cylindrical shape.

**WHAT CLOVES ARE.**—Cloves are the unopened flower of a small evergreen tree that resembles in appearance the laurel or bay. It is a native of Molucca, or Spice Islands, but has been carried to all the warmer parts of the world, and is now cultivated in the tropical regions of America. The flowers are small in size, and grow in large numbers, in clusters to the very ends of the branches. The cloves we use are the flowers before they are opened, and whilst they are still green. After being gathered, they are smoked by a wood fire, and then dried in the sun. Each clove consists of two parts of a round head, which are the four petals or leaves of the flower rolled up, inclosing a small number of stalks or filaments; the other part of the clove is terminated with four points, and is in fact, the flower cap of the unripe seed vessel. All these parts may be distinctly seen if a few cloves are soaked for a short time in hot water, when the leaves of the flower soften and readily unroll.

**CAN NOT SPEAK FOR CHOKING.**—When I rise to speak, I am so embarrassed my heart seem to rise in my throat and choke me. It is not for the want of knowledge of my subject or from the loss of words. What is the trouble and what the remedy?

*Ans.* If you use coffee and tobacco, their effect is to induce a rush of blood to the head under excitement. Embarrassment can be overcome by practice. You should read in public, and after awhile you can speak your own thoughts. Some ministers are, for many years, afflicted in the same way, but by writing and reading their discourses, in whole or in part, they finally overcome the embarrassment. —*Herald of Health.*

**AN ARTIFICIAL WHIRLWIND.**—The fact that whirlwinds are caused by upward currents of heated air, was demonstrated in the town of Queensburg, N. Y. in the following manner:—A farmer having occasion to burn a yellow pine fallow of some 20 acres, fearing that the fire might spread into the adjacent timber, ignited the fallow in several places on the edge, after taking the precaution of cleaning off the brush

from a strip surrounding it. The flames rushing toward the centre from every direction, the air and smoke soon assumed a rotary motion, which increased in intensity. This whirlwind—for such it was—after becoming fairly formed, moved with wonderful velocity on its axis, tearing up small trees by the roots and lifting them into the air, stripping the branches from some that adhered too firmly to the ground, and fairly wringing the bark from others. It was accompanied by a noise resembling thunder, and lasted from five to ten minutes, but did not pass the bounds of the fallow, although it swayed back and forth across the field of fire several times.

## How Scientific Men Work.

It is said when an eminent foreign savant once called on Dr. Wollaston, desiring to be shown over his laboratories, in which science had been enriched by so many important discoveries, the doctor led him into a little study, pointed to a table on which was an old teatray containing a few watch-glasses, test papers, a small balance, and a blowpipe, and said: "There is all the laboratory I have." Now, how was this possible? How could this meagre apparatus, which a schoolboy would find insufficient, serve to suggest and establish some of the highest and most fundamental truths of chemistry? Does not the explanation at once suggest itself, that the true field in which the leader of scientific thought works is his own mind? A great man uses the things which he sees to suggest to him ideal existences, and in his capacity of creating such as are consistent with all the known facts of the universe; his fame and distinction are grounded. Nothing could be farther from the truth, than to suppose that science accords with Mr. Gradgrind's demand for "facts, facts, nothing but facts". On the contrary, Prof. Tyndall long ago defined science as "the art of seeing the invisible," and, in a recent brilliant lecture, has happily shown that its progress depends largely on the fullest possible use of the imagination.

## How to Clear a Discharge Pipe.

It is not unusual to find the discharge pipe from the sink stopped, in consequence of the carelessness of a servant. In such a case, especially in the city the plumber has to be called in, who applies his air pump, and the clearance is effected. But plumbers are not always men of their word—in a recent instance we were compelled to wait two days before the plumber made his appearance. In consequence of this plumber's delay we set to work to study an air pump that might answer for the occasion, and one that would always be on hand. Here is the result and it works perfectly: Take a straight poker, or stick, and wrap one end with a wet cloth, holding the other end in the hand for safety, and use it as a piston in the pipe. Work it up and down a few times, and the clearance is effected.

**THE CARAT.**—WHAT IT IS.—The carat is an imaginary weight, that expresses the fineness of gold, or the proportion of pure gold in a mass of metal; thus, an ounce of gold is divided into twenty-four carats, and gold twenty-two carats fine is gold of which twenty-two parts out of twenty-four are pure, the other two parts being silver, copper or other metals. The weight of four grains, used by the jeweler in weighing precious stones and pearls, is sometimes called diamond weight—the carat consisting of four nominal grains, a little lighter than four grains troy; seventy-four and one-sixteenth carat grains being equal to seventy-two grains troy. The term or weight carat derives its name from a bean, the fruit of an Abyssinian tree called kuara. This bean, from the time of its being gathered, varies very little in weight and seems to have been from a very remote period, used as a weight for gold in Africa. In India also the bean is used as a weight for gems and pearls.

**PHARAOH'S SERPENTS.**—These, once so largely popular toys, have been almost entirely abandoned, owing to the poisonous character of their constituents and of their fumes. Dr. Puscher now announces that a mixture of 2 parts of bichromate of potassa, 1 part of nitrate of potassa and 3 parts of white sugar will produce the effect of the serpents without the attendant inconveniences. He recommends the mixture to be done up in paper or tin foil cones, as the original "serpents" were; and also the addition of some balsam of Peru to perfume it.

## GOOD HEALTH.

## Remedy for Chronic Diarrhoea.

The following remedy for chronic diarrhoea is from a medical work by Dr. Fancher:

Take two pounds of the bark of the root of blackberry; add a suitable quantity of water; boil for two hours, then pour off the liquid; then add more water; continue to boil and pour off till all the strength is extracted; then strain, and add all boilings together; simmer to two quarts; strain; add four pounds of loaf sugar, and when cold, add half a pint of the best French brandy. Dose, a tablespoonful three times a day, fasting. If it does not arrest the disease in a few days, gradually increase the dose as the stomach can bear.

The author says it will effect a cure when every other means fail.

Another and simpler remedy is as follows:

Put a tablespoonful of wheat flour in a tumbler of water; beat until it foams, and drink immediately. If the patient is thirsty more water may be added. It should be taken four times a day before meal times, and on going to bed.

**PHYSICIANS AS TEACHERS.**—Mrs. Julia C. Hill, who recently delivered the annual address before the Oregon and Washington Health Reform Association, remarked as follows on the duties of physicians:—"Permit me to say a word in regard to the duties of physicians. While the duty of curing the sick is justly regarded as of great importance, it has always monopolized too great a share of the physician's attention. The duty of teaching people how to live correctly, so that sickness will not be necessary, should be considered by every physician as paramount to any other duty. Physicians should also be qualified to instruct the people in regard to nursing the sick. In many cases, as much depends on good nursing as on the skill of the physician, and there are but few persons who properly understand the art of nursing the sick. Hence, to know and to teach how to nurse the sick, becomes one of the most important duties of the physician."

**BUTTER AND WORMS.**—There is no doubt that the larvae of the various worms which infest the alimentary canal of children, and frequently, too, of adults, are taken in with the food. Greasy substances are apt to abound with them. In a late German medical journal, a Dr. Huber relates many experiments he has made on this subject, and he comes to the conclusion that no article used by man as food, especially during childhood, is so prolific a cause of intestinal worms as butter. The use of butter serves also for the introduction of insects, as well as worms; and as American children seldom eat bread without a thick coating of butter, the general presence of intestinal worms need not be wondered at.

**AN INDICTMENT AGAINST ALCOHOL AND TOBACCO.**—The report of the British Factory Inspector, contains a statement made by the certifying surgeon at Bolton-le-Moors, that the children of the mill population are year by year getting smaller, and physically less capable of doing their work. He attributes this partly to their being the children of intemperate parents, partly to their being brought up on tea and coffee, instead of more substantial food, and partly to the circumstance that many young children, of about 12 years old, begin to smoke, acquiring the habit from their fathers, and possibly from their mothers.

**MEDICINAL PROPERTIES OF COFFEE.**—There are many medicinal virtues in coffee. When taken in moderation it is a gentle stimulus to the digestive organs. It relieves some forms of headache. It is excellent when one is fatigued or exhausted.

Very strong coffee will cure drunkenness. Many fashionable bar-rooms keep it made for that purpose. It is eminently useful to cure the habitual drinker, or those who wish to cure themselves of the habit of using intoxicating liquors. It will keep any one awake, and, therefore, should not be drank last before going to bed.

**DRINK WATER IN THE MORNING.**—If we would establish the habit of drinking water freely in the morning, soon after arising, commencing with small quantities, increasing gradually as we learn to relish it, until the chief portion taken during the day is before breakfast, it will promote the health to a much greater extent than it ordinarily does, eradicate disease from the system, and become a most decided luxury in time.

**FOR CHOLERA AND CHOLERA MORBUS.**—A correspondent of the *St. Louis Republican* furnishes the following hint which is timely, and may be worthy of trial:—"Make a weak ley from good wood ashes, about as strong as common tea. Drink after each meal about half a wine glass full of the above water, which I guarantee will prove a complete preventive against cholera morbus or dyspepsia. This can be given to an infant without injury. Whenever the bowels become lax, or unchanged, ley water should be freely used. In the year 1819 I passed up the Missouri river on the steamer Robert Campbell, William Eads, Captain. Two men died out of the cabin from 4 o'clock in the afternoon to 10 o'clock next morning. I consulted with Capt. Eads, and advised that he should put wood ashes in the drinking water, so that all the passengers would have a drink of it. He did so. This happened at Wakadaw Prairie. He had not another sick or complaining passenger from there to Council Bluffs, and I have conversed with him frequently since, and he told me he had always adopted that plan, and never had any sickness on his boat during the California emigration of that year. This simple medicine is in the reach of every body. When made and put in bottles it will last good for a year."

If you wish to have a healthy stomach do not wear a belt or any other thing in the form of clothing tight around your waist. Dyspepsia with girls and women is often caused by reason of tightness of clothing over the stomach. With men it is often caused by the high waistband on their pantaloons or drawers, worn tight about the body over the pit of the stomach. Let all your clothing be thoroughly loose at that point. Bad as tight clothing is on any part of the body, there is no place where it can be more productive of disease than at, or about, or over the stomach. The stomach needs plenty of room to act. Do not press it from without. If you do it will shrink to get away from the pressure. A great many persons have dyspepsia because they have contracted the stomach from without. Not having space enough in which to work healthy, it becomes so shriveled up that it is not large enough to retain what food the body needs for the maintenance of strength and health.

**TO REMOVE WARTS AND CORNS.**—*Home and Health* contains the following:—"Warts are not only very troublesome, but disfigure the hands. Our readers will thank us for calling their attention to the following perfect cure, even of the largest, without leaving a scar. It has been tested by the writer: "Take a small piece of raw beef, steep it all night in vinegar, cut as much from it as will cover the wart, and tie it on, or, if the excrescence is on the forehead, fasten it on with strips of plaster. It may be removed during the day and put on every night. In a fortnight the wart will die and peel off." The same prescription will cure corns.

**A CURIOUS MEDICAL EXPERIMENT.**—In Russia, not long since, it is said, some murderers were placed, without knowing it, in four beds where four persons had died of the cholera. They did not take the disease. They were then told that they were to sleep in beds where some persons had died of malignant cholera; but the beds were, in fact, new, and had not been used at all. Nevertheless, three of them died of the disease within four hours.

**COLORADO FOR ASTHMATICS.**—The last number of the *Medical and Surgical Reporter* mentions the case of a citizen of Detroit, who had for thirty years suffered intensely from asthma, recently migrating to Colorado, where he soon experienced a decided relief, and, after a stay of three or four months, found himself entirely cured. He regards the pure, rarified atmosphere of that elevated, non-malarious region as a positive antidote for asthma in all its forms.

**GENERAL PREVALENCE OF CANCER.**—Dr. Bliss, of Washington City, estimates the number of cures of cancer now under treatment in the United States at 100,000, with an average number of 6,000 deaths per week.

**WATERMELONS** are very injurious for debilitated and nervous people, but good for persons of full habits and torpid livers.

Those who use a plain, unstimulating diet, have little thirst.

**SLEEP** will do much to cure irritability of temper, peevishness and uneasiness generally. It will cure headache and neuralgia and brace up and make strong a weary body.

**THE MONT CENIS TUNNEL.**—A telegraph dispatch announces that this tunnel, one of the wonders of modern times, has been opened and that trains are passing through successfully. When first tried, a serious difficulty was met with from the fact that the smoke of the locomotives became so dense, through want of a current of air to carry it off, that the engineer and fireman were suffocated while passing through. This obstacle has been overcome by employing smoke-consuming locomotives. The work was inaugurated fourteen years ago, and has progressed since then without interruption. Running through the Alps, it is the means of facilitating travel between France and Italy. Modern inventions have so far increased the means of completing an enterprise of this kind, that it is to be hoped that our much-talked-of tunnel under the Sierra Nevada, estimated at between five and six miles in length, to be used by the Water Co. and the C. P. R. R., will be finished in a much shorter space of time, proportionally. To modern science and engineering skill, mountains and rivers, instead of obstructions, are only considered as mediums for the exercise of ingenuity and ability, and these two important enterprises will show which of the two, American or French engineering, excels.

Germano Sommeillier, the great Italian engineer, who was the first to project the tunnel through the Mont Cenis, and was finally entrusted with its undertaking, died a few days ago, at his home in the Savoy mountains, after having lived to see the successful completion of his task.

DEER are unusually numerous among the foothills of Los Angeles County.

## The California State Fair.

The Fair opened on Monday, and at the time of our writing (Wednesday) is considered more than an ordinary success.

The pavilion is well filled—above and below—notwithstanding its enlargement. We can only speak briefly of some of the features of the exhibition this week.

The fruit display of our own State with that from Nebraska, Kansas, Illinois, etc., attracts more than usual attention. The Nebraska fruit is notable for its large and fresh appearance.

The silk culturists present a more varied representation than formerly.

The display of horned and small stock at the grounds shows decided improvement, and affords much of interest for examination and comparison.

The plowing match was thinly attended, this morning. At the trial there was a new sub-soil gang plow, by Myers & Gammow, of Marysville; a 2-gang plow, and a large stubble single plow, by Hill & Knaugh, Marysville; a 2-gang plow and a single plow, by Matteson & Williamson, Stockton; a Napierville, (Illinois) single plow by O. C. Ely, agent, S. F.; and last, (but not least by any means) Thompson's Road Steamer, with a 7-gang plow, by Jones & Hewlett, of Stockton.

A general view of the exhibition shows decided advancement in agriculture, horticulture and stock raising in the State, and an increased determination for improvement in the same. Such evidences of encouragement after such a discouraging season, for most farmers in the State, is the subject of pleasant reflections, and we feel sure that this is but the beginning of better things in California husbandry.

## The President's Address

Was delivered to a large and attentive audience at the Pavilion on Monday evening, by Mr. Reed, who rendered an account for the seventh year of his stewardship. After alluding to the prosperous condition of the Association, under conditions most unfavorable for Agricultural industry, he passed to a brief review of some of the chief features of the present exhibition, and took occasion to comment somewhat severely on the neglect which was shown to dairy products in California—a State which presented more favorable conditions for such business than any in the Union.

He presented to his audience, as disgraceful to the intelligence, industry and financial common sense of California agriculturalists the fact that we are paying for the making and bringing 3,000 miles one hundred tons of butter a week—and all this while tens of thousands of acres of as good dairy lands as ever lay out door, and as many loving herds of the best dairy kine, united in calling young men to marry, milk the cows, make butter and get rich.

The speaker dwelt upon the importance of horses—the best of horses—horses of pure blood, easy pace, speedy trot and long endurance. Having presented some practical information on horses and horse-raising, Mr. Reed congratulated the audience upon the success of the Fair, and closed with a cordial welcome to one and all.

**AUSTRALIAN SPIDER.**—Mr. A. G. Bourd of the Southern Australian Telegraph party, says that spiders abound in great numbers in that part of the world—that in riding through the hush both rider and horse become covered with webs. He sends to the editor of the South Australian Register a specimen 6 or 7 feet in size, broken off while he was riding through the Mulga scrub. The fibre is as strong as silk and very tough when first taken. Immense quantities may be obtained. He heard that one of the advance parties had made the material into a cracker for their whips!

A BEET sugar enterprise is projected for Santa Clara.

## ROASTING GOLD AND SILVER ORES.

In Mr. Raymond's report on mines for 1870, page 356, he says of the Keith furnace: "The cardinal defect was in trying to desulphurize in a reducing flame, and in the time—one second." Some person in Virginia City calls Mr. Raymond's attention to the remark and propounds the following queries:

1. Is there any more reducing flame or effect in the Keith than in the Stetefeldt furnace, chloridizing or desulphurizing like the Reno furnace; that is using wood, and like Keith's—completing the operation in a second or two?

2. If so,—why?

3. Is there any possibility of desulphurizing or chloridizing in an upright shaft, with the proper condensing chambers, feeding the pulp with a blower, and thereby furnishing also the required draft?

Mr. Raymond's reply, which is given through the *Engineering and Mining Journal*, will be found of considerable interest to all who are engaged in smelting gold and silver ores. We append it in full as follows:

## Reply.

1. We cannot do better than to recommend to our correspondent a more extended perusal of the report to which he refers. He will find on pgs. 749-755 a full description of the Stetefeldt furnace together with a full explanation of the chemical reactions which take place in the furnace.

Of course Mr. Stetefeldt cannot accomplish an oxidation of sulphur, and its removal as sulphurous acid, except by the presence of oxygen in the furnace. He never attempted to do it. Mr. Keith, it appears, did make the attempt and failed.

The difference between an oxidizing and a reducing flame, is simply that the former contains an excess of oxygen which it is ready to yield to substances, which, at the prevailing temperature, have sufficient affinity for it. In order to oxidize the sulphur contained in pyrites, a good supply of free oxygen at a high temperature is requisite; this, Mr. Keith, probably through some defect in his apparatus, did not obtain. If he had used salt and supplied a sufficient amount of oxygen to his flame he would doubtless have obtained different results. Our correspondent must remember also that the Stetefeldt furnace is used for silver ores, and that the roasting is at the same time a chloridation. Mr. Keith's experiments were made with gold ores, and without the use of salt.

If gold ore mixed with salt were to be passed through the furnace at Reno, there is some doubt as to what the result would be. The chloride of gold is decomposed at a comparatively low temperature, so that it is exceedingly doubtful whether it would be formed at all. If it were formed and again decomposed the gold would probably be left in a good condition for amalgamation.

It has been suggested that the chloridation of the base metals might be accomplished and the gold simply freed from the pyrites and rendered easy of amalgamation. If this were possible, the copper, for example, could be lixiviated as a chloride, and saved. The heat, however, would probably decompose the base metal chlorides, as well as the gold chloride, and nothing would be gained.

Still it appears probable that salt might play a very important role in the desulphurization of gold ores by merely shortening the time necessary to complete the operation. The sulphuric acid of the sulphates formed in roasting would decompose the salt and unite with the soda—the heat being so high that the chlorine would not unite with either gold or copper. The salt in that case would only serve as an agent for the decomposition of the sulphates formed in the roasting, and to accomplish this purpose perhaps some better and cheaper agent might be found. If a piece of pure, bright gold be allowed to remain in a heated muffle for a few minutes, near a piece of pyrites, it will on removal, be found apparently unchanged, but inert with reference to quicksilver. Now, if we immerse the piece of gold for a short time in hydrochloric acid and again bring it in contact with quicksilver, amalgamation will commence at once, showing that something has been removed by the acid. It has been suggested, in conformity with such observations, that the main object in roasting gold ores is to free the small particles of the metal from a coating which prevents their contact with quicksilver. A simple roasting does not accomplish the removal of this coating, but only its conversion

into an oxide, which is still sufficiently strong and thick to prevent many of the particles coming in contact with the quicksilver. It is claimed that what is really wanted, to obtain good results in amalgamating roasted pyrites, is a cheap means of removing this coating of iron oxide. At a red heat, chlorine unites with iron and forms an exceedingly volatile chloride, which would pass out of the furnace with the products of combustion. It is considered probable, by many of our best metallurgists, that the chlorine set free from the salt would combine with the fine films of iron rust covering the gold, and the chloride becoming volatilized by the heat, the gold would be left bright and in an excellent condition for amalgamation. A few months' practical working would prove more than all the theorizing in the world, but the owners of the furnace have never had sufficient confidence in its adaptability for gold ores to be at the expense of a trial.

2. The reason for the superior oxidizing power of the Stetefeldt furnace is that proportionally more oxygen is admitted to the flame.

3. We do not doubt the possibility of constructing a furnace so that the finely divided ore could be blown in by a current of air from a blower. We fail to see, however, that this plan would possess any advantage over the method now employed at Reno, viz: sifting the pulp in at the top of the furnace and using a natural draft instead of an artificial one. The easy, cheap and effective manner in which the Stetefeldt furnace is fed constitutes one of its chief merits.

## ON THE ASSAY OF GOLD.

BY HENRY G. HANKS.

[Expressly for the Press.—Continued.]

When the gold is in a fluid state the mould must be placed on a level surface, and oil poured into it. To make a clean bar it will be found best to use considerable oil—pour in sufficient to cover the bottom of the mould to the depth of at least one-fourth of an inch. Turn the mould in such a manner as to allow the oil to flow to all parts of its interior, and then place it again level and in the position you wish it to occupy while you cast the gold. If the gold is clean, and the quantity less than 50 ounces, it is best not to attempt to skim it. Two spoonfuls of nitrate of potash ought to be added, and one of carbonate of soda, and the whole allowed to flow over the surface of the gold. When very hot, and the slag very fluid, lift the crucible from the furnace and with a bold and steady hand pour it into the mould, holding it for a little time in an inverted position to allow the last portion to flow from the crucible. The oil inflames and remains burning on the slag, which flows evenly on the surface of the gold. If the mould was clean, and of the right temperature, and if sufficient oil was used, a clean bar will result. A little practice will enable the operator to hit the exact conditions. The oil used should be a cheap animal oil; common whale oil answers every purpose. Lard oil is also well suited; coal oil is too inflammable as well as dangerous, and should never be used.

When cold, the bar falls easily from the mould; a slight tap with a hammer separates the slag, and the bar may be cleaned with water, and nitric acid, or if necessary, with sand and a suitable wash. A good way is to place the bar in the furnace until it becomes nearly red hot, and then quenching it suddenly in water. This will be unnecessary if proper precautions have been observed in preparing the mould.

When the gold is very impure—which is the case when in the form of retorted amalgam which has not been properly cleaned,—a different method of treatment should be adopted. A larger sized crucible will be required. Three or four times the amount of flux must be put in and a spoonful of carbonate of potash with it. A skimmer must be prepared by forming the end of a large wire about the size of a common lead pencil, into a spiral about a half inch in diameter, and bending it so that when the skimmer is let down vertically into the crucible, the spiral will lie flat upon the surface of its contents.

A bucket of water is set convenient to the furnace, and when the slag has become fluid and it is beyond question that the gold has become perfectly melted, the

skimmer is touched to the slag and gently moved from side to side; a portion of the slag adheres to the iron, the skimmer is removed and plunged into the water, and immediately replaced in the crucible; an additional portion attaches itself to the skimmer—which is again quenched in the water. This is repeated until a large portion of the slag is removed, and a new charge of flux, consisting this time of borax and nitrate of potash, is allowed to fuse down upon the surface of the gold. The first flux is removed from the skimmer by a slight blow from a hammer and the crucible is skimmed with it as at first. This must be repeated until all iron and other impurities have been removed, and the surface of the molten gold appears when exposed, clean and reflective as a mirror. It may then be poured into the mould as described before.

In large meltings it is customary always to skim the gold before pouring, and so far to remove the slag that any remaining portion may be left on the sides of the crucible, and the gold only allowed to flow into the mould; this requires some skill and considerable practice; as it is imperative that the bar should be homogeneous to ensure a correct assay; it is usual to mix it thoroughly before pouring. This is done in the large way by stirring just before lifting from the furnace. It may be done with an iron rod, with a piece of black lead held with the tongs or with a clay stirrer made for that purpose; which even if used it will be necessary to allow the stirrer to remain in the crucible until it has acquired the temperature of the fused gold; otherwise, a portion of the gold may attach itself to the rod and be removed with it. In small meltings it will be found sufficient to mix the gold by giving the crucible a rotary motion while holding it with the tongs, just previous to pouring. This must be done so quickly that the crucible has no time to cool.

For very small fusions it is best to use a small Hessian crucible, and when the gold is melted with plenty of flux, to set it aside to cool, and then break the crucible and separate the pieces of crucible and portions of slag by slight blows of a hammer on the edges of the bottom. It is very difficult to pour small quantities of gold without loss—by portions remaining on the sides of the crucible.

When the bar is clean, a small portion must be taken from different parts for assay. It is customary to cut from opposite corners with a cold-chisel; but this is extremely clumsy and in every way inconvenient. If the bar is brittle, a much larger piece may break off with the chip than is required. If the proper sized chip is cut off successfully it is likely to fly away, and either be lost, or if found its identity is doubtful. The proper way is to bore into the bar in different parts with a small drill. This may be done in a lathe, or by means of a ratchet drill. In any case the bar should be placed in a clean copper pan so that no loss may occur, the surface borings resulting from the first revolution of the drill should be rejected. Those that follow to the extent of a little more than a grain are to be placed in a suitable vessel and carefully preserved for assay. Before cutting or boring the bar the number of the assay should be stamped upon it, and the same number placed with the clippings. This number should represent the bar through every stage of the assay by which its value is ascertained. Some assayers stamp the initial of their name in the cut faces so that no portion can be removed after it leaves their hands.

[To be continued.]

**SAWMILLS IN OREGON.**—The *Oregonian* gives the number of sawmills in operation in each county in that State, which foot up a total of 173, about one-quarter of which are driven by steam—the balance by water. The capacity of these mills is estimated at 1,200,000 feet of lumber per day. The largest of the number is located at Milwaukie, owned by the Oregon and Central Railroad Co., and has a capacity of about 140,000 feet per day. This list is supposed to be quite incomplete; and aside from those here enumerated are quite a number of mills situated on the Washington side of the Columbia, but which supply much lumber for Oregon, and for many vessels engaged in the Oregon trade.

**THE WILD GEESSE** are migrating southward rather earlier than usual—an indication of an early setting in of the rainy season.

### An Improved Oar.

We give herewith an illustration of an invention which is likely to popularize still further the already favorite amusement of rowing.

In the ordinary method the oarsman is obliged to sit with his back in the direction of his boat's course, and consequently if he has no one to steer the boat, he must either run the risk of frequent deviations from his course, and an occasional collision, or be subjected to the alternative of constantly looking over his shoulder, which is very tiresome. Although the practiced oarsman can direct his boat with little difficulty, yet the majority of amateurs will be inclined to favor the new invention if it is made to work to their satisfaction.

With this explanation we will proceed to describe the engraving, which represents a portion of the side or gunwale of a boat having a semi-circle of metal, *a*, secured to it, as shown. Another semi-circle *b* is formed with flanges and fits into the first one so

PRINGLE & WOOD'S IMPROVED OAR.

that the oar can be turned in the hand or feathered, as it is called, after completing a stroke and while reaching for another. The oar itself is formed in two parts, *c*, *d*, which meet just over the gunwale, and are each fitted with a metal cap, *e*, which has teeth on its outer curved end, as shown in the small figure.

Pivots from these caps extend into the plates, *g*, which lie above and below the joint, so that when the handle of the oar is pulled in one direction the blade will by means of the gearing be made to move in the same direction, thus propelling the boat in the direction to which the operator faces. The inner end of the oar is depressed and the outer end elevated at the termination of a stroke and the oar turns on pivots, *n*, shown at each side.

The inventors, Thomas Pringle of New York, and John Wood of this city, are desirous of disposing of their interest, either wholly or in part, for this coast. Any further information can be had by calling on or addressing Mr. John Wood, 135 Folsom street, San Francisco, where a model can be seen.

**IN MEMORIAM.**—Passed on from this life, in Washington, D. C., September 18, 1871, Mrs. Eliza Dewey Sweeney, widow of the late Hugh Bernard Sweeney, and sister of Edw. M. and A. T. Dewey, of California. She leaves two daughters. Although personally departed, the influence of her noble mind will ever shine with brightness in our pathway on this side of the border.

## PATENTS & INVENTIONS.

### Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING SEPT. 5.

**BED LOUNGE.**—Althor Frederick Bonten, San Francisco, Cal., assignor to himself and Farrell Jerome O'Reilly. Antedated August 11, 1871.

**CHURN.**—Elias Groat, Napa, Cal.

**CHURN.**—Elias Groat, Napa, Cal.

**MEDICAL COMPOUND.**—Benigno Gutierrez, Santa Barbara, Cal.

**NOTE.**—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

### Mining Claims.

The following important instructions have been received by the Register of the

person forming such association in the manner hereinbefore described.

You will notify all applicants accordingly, informing them that no patents will issue upon any application already made and pending, or which may hereafter be made for mineral claims, in default of a compliance herewith. Very respectfully, your obedient servant,

WILLIS DRUMMOND, Commissioner.

### The Mechanics' Institute and Its Awards.

**EDITORS PRESS:**—At the close of the late Fair of the Mechanics' Institute, President Halldie stated that it was not probable another Fair would be held for some years. This can scarcely be a subject for regret, as the late Fair was confessedly not a good representation of the industries of the Pacific Coast. As a promenade for ladies and gentlemen in the evening it was a success; but for the purposes announced it was a failure. Very few exhibitors of former years, except those who had goods which they wished to advertise, appeared at this Fair, and a great number who had an eye to the awards were there who had never exhibited before, and were not familiar with the principles governing the distribution of awards as adopted in this Institution.

The action of the Board of Managers at the late Fair will have a tendency to destroy whatever confidence may have existed in their system of awards. It makes a Californian blush, that an Institution which is supposed to represent the industries of the State, should, after granting a premium in accordance with the recommendation of an examining committee of its own appointing, and after announcing it through its President, attempt to take it away.

It puts one in mind of a custom that formerly prevailed in some portions of England, where, if a widow who inherited lands from a deceased husband, should neglect the observance of a certain commandment, she was compelled, in order to regain her lands, to ride into court on the back of a black ram, and to repeat the following, or words to that effect:—

"Here I am upon this black ram,  
Weak woman that I am;  
For this world's gain  
I have done this shame,  
I pray you let me have my land again."

Not only this was done, but in other cases, after the Examining Committee had made their recommendation, and the "Committee of Three" had made the same recommendation, changes were made by the Managers, discriminating against California productions.

Until such abuses are corrected, the public who know how affairs are conducted will have no confidence in any awards of the Mechanics' Institute.

The receipts at the Fair were about \$60,000, and the full value of all of the awards was not to exceed \$2,500. Cash premiums were announced amounting to \$3,350, of which only \$700 were awarded. And now, after clearing more than \$30,000 above all expenses, we find the Managers could not afford to pay a premium which their chief officer had publicly announced.

What motive could have induced the Managers to go behind the recommendation of their own Committees? It must have been a very strong one. Had they rested on the action of their Committees, as they announced in their circular they would do, no error in the judgment of the Committee would have affected them. I am credibly informed that articles in which the officers had an interest were taken from one Committee who were not allowed any first premiums, and given to another Committee which was allowed to recommend first premiums. With such practices as this, although no wrong might have been intended, confidence in the Mechanics' Institute will remain at a low ebb.

San Francisco, Sept. 20, 1871.

**LOSS OF QUICKSILVER.**—We would call especial attention of our mill men to the communication of Mr. A. B. Paul, upon the loss of quicksilver, which will be found in another column. The subject which he presents is one of the highest importance, and the information which he solicits, will be considered strictly confidential, and will in no case be made public, or even communicated to any second party. It will be used by him, alone, and only as a means for deducing such generalizations as will lead to the suggestion of means for considering such losses in future. We know of no man who would be better able to make a proper use of such information than Mr. Paul. Whatever deductions or suggestions he may make will be published in the SCIENTIFIC PRESS for the benefit of all. We trust our mill men will give a free and unreserved response to his queries.

**CATTLE FROM SAN JOAQUIN.**—A band of 1,000 head of cattle, belonging to Mr. Anderson, arrived at Winnemucca, Nevada, on Friday of last week, on their way to Idaho, from San Joaquin County in this State.

## DOMESTIC ECONOMY.

### How to Carve.

It is a great accomplishment to be able to carve well and easily, without awkwardness; but it is one that receives altogether too little attention. Too often, it would seem that whoever is called upon to perform this table duty, has no idea of there being anything needed but to hack off in the most expeditious manner as much meat as is required to satisfy the wants of those present, without the slightest reference to the mode in which it should be done, or the choice hits to be secured by careful carving. We have seen those who in every other respect were real gentlemen and ladies, carve poultry or a piece of meat, in such a barbarous manner as to banish all desire to eat, and almost the ability to taste the big uncouth, mangled lump that was put or rather thrown on our plates. To cut off a thick, rough piece from any part that the knife happens to light upon first, aside from being untidy and unpalatable, is also very wasteful. After two or three such careless cuttings, the whole piece is so defaced and uneven, that it is no longer possible to secure a decent looking hit; and the bone is left with much adhering to it in ragged morsels, that dry and become worthless if left over to the next day, but which, had the joint been properly carved could have been sent to the table for a cold relish for tea, in a neat and attractive form.

Our ladies are seldom good carvers, and do not often attempt it. Few have been taught, or thought it worth while to try and learn; but in early times it was considered an indispensable part of a girl's education. The want of such knowledge often leaves one in an unpleasant and embarrassing position; for to every one there occasionally comes a time when the gentleman of the family must be absent, and the lady must do the carving, or ask a guest or stranger, who may be more awkward than herself.

To stand up while carving is not as proper or as skillful a way of doing the work as to be seated; but it is sometimes easier and more convenient, and, if the table be at all crowded, less troublesome to guests. In such cases it is quite allowable.

The carving knife must be sharp and thin. A large, broad-bladed knife is needed for meats; a long, narrow, and sharp pointed blade for poultry and game; both should be kept in perfect order, and always ready for use.

### How to Carve Poultry.

When dished, poultry and game must be laid on the hack, the breast uppermost, for the greater convenience of the carver, who should put the fork into the breast, holding the bird firmly until he has taken off the wings and legs, cut out the "merry thought" or "wish bone," cut nice, even slices from the breast, and removed the collar bone. A skillful carver will do all this without once turning the fowl over. Next cut off the side bone, and cut down the back dividing the carcass in two. Separating the drumstick from the second joint, and in helping a lady, if she prefer the wing, cut in two parts that she may handle it more conveniently.

### To Carve a Leg of Mutton.

A ham, or leg of lamb or mutton, should be first cut in the middle clean down to the bone, passing the knife all round. Then cut thin, even slices from the upper or thicker part, separating each slice from the bone at the bottom, carefully, without tearing it. Some slices can also be cut from the lower part of the leg or ham, which are just as good as the upper part; but after a little you come to the cords or fibres, and then the remainder of the lower part should be set aside, to cut out all the little bits for a relish at tea, or, in ham to chop up as seasoning, or, with scraps of other kinds of meat for hash. By cutting meat in this way much may be saved. Good carving is good economy.

In carving a forequarter of lamb, divide the shoulder from the ribs; then separate the ribs; and in carving the hindquarter, serve a bit of kidney and fat with each piece, if agreeable to your guests. Some people dislike the kidney, and would eat with more relish if it were not on their plate. The forequarter of pork and mutton should be carved in the same way.

### A Fillet of Veal, Etc.

In carving a fillet of veal, begin at the top to cut, serving a portion of the dressing to each guest. When carving the breast of veal, cut the upper portion of the

brisket, or that part of the breast that lies next to the ribs separately, and in helping, inquire what part is preferred.

The middle portion of hoiled tongue is the best, and should be first served to guests. The tip is only fit for hashes. It should always be cut crosswise, never lengthwise.

When dishing a sirloin, place it on the platter with the tenderloin underneath, and in carving cut thin slices from the side next to you; then turn the piece over, and carve the tenderloin carefully, serving equally from both parts.

Some like to send a young pig whole to the table, with a lemon or a bunch of parsley put into the mouth. We think it much nicer to take the head off and cut the pig in halves or quarters before sending it to the table, and then carve it. It would be very unpleasant to many to see such a revolting caricature of a *live pig* brought before them. But each one must judge for himself.—*Mrs. Henry Ward Beecher.*

**PLEASE EXPLAIN.**—Will the Editor of the PRESS please explain the philosophy of the following occurrence, and oblige a

HOUSEKEEPER.

A Western lady recently met with a serious mishap. While the soap she was making was boiling at a lively rate, she turned into the kettle a quantity of cold lye, when the contents exploded with great force, scalding the persons present in a shocking manner. The explosion was instantaneous and so powerful as to leave the kettle entirely empty.

We are not sure of our ability to "explain;" but if the occurrence took place as stated, we should suppose that the temperature of the "boiling soap" was so much above that of boiling water, that when the water was poured into the kettle, it was so rapidly converted into steam that an explosion was the consequence; much as the same occurrence takes place, when water is poured upon melted iron. We do not know the temperature at which soap boils; but our impression is that it must be much above the boiling point of water; else the above explanation cannot be correct.

### Something New—A Water-Proof Starch.

A patent has been recently taken out in France for the preparation of a finish, or starch, for vegetable tissues, yarns, clothes, etc., which is not soluble in water, and which, therefore, when once applied, will remain throughout several successive washings. In this case, the articles in question are properly starched and then placed at a temperature of about sixty degrees Fahrenheit through a bath of chloride of zinc, by means of which such a change is produced in the fibre and the starch that the latter resists the action of the water in the most thorough manner. A bath of three parts of sulphuric acid and one of water, may, it is said, be used instead of that of chloride of zinc. The liquid is to be placed in a trough, in which a revolving barrel is immersed, almost to its axis, and above which is a roller which is moved in an opposite direction by the turning of the lower one. Between the two the material to be impregnated is passed, being moistened from below by the bath, and in passing between the two, receiving the necessary pressure. If the material be heavy, the barrel lies entirely in the bath, and a pair of rollers fixed above it is used to press out the superfluous liquid. The articles are carried directly from the trough into running water, from which they are to be removed, pressed out and dried.

**TO MAKE SOUP TABLETS.**—The *Chemical News* gives us from the German Manuals of Pharmacy the following receipt, by Reinsch, for making the soup tablets so much in use in the German army during the late war. The formula is as follows: Take eleven parts by weight of good suet, melt it in an iron pan, and make it very hot, so as to become brown; add, while keeping the fat stirred, eighteen parts of rye meal, and continue heating and stirring so as to make the mass brown; add then four parts of dried salt and two parts of coarsely pulverized caraway seed. The mixture is then poured into tin pans somewhat like those used for making chocolate into cakes. The cakes have the appearance of chocolate, and are chiefly intended for the use of soldiers while in the field. A quantity of about one ounce of this preparation is sufficient to yield, when hoiled with some water, a ration of good soup, and in case of need, the cakes being agreeable to the taste, may be eaten raw.

### Domestic Receipts.

**BAKING CAKE.**—Here is a simple way of preventing cake from sticking to the tins in which it is baked. Grease the tins thoroughly, then put in a handful of flour, shake it all over the inside of the dish, in which you bake; then, after turning it upside down, strike it on the edge of your flour bowl; that will free all that does not adhere to the grease. Now put in the dough and your cake will "come out" nicely.

**TO CLEAN LOOKING-GLASSES.**—Take a newspaper, fold it small, dip it in a basin of clean cold water. When thoroughly wet, squeeze it out as you do a sponge; then rub it pretty hard all over the surface of the glass, taking care that it is not so wet as to run down in streams; in fact, the paper must only be completely moistened, or dampened, all through. Let it rest a few minutes, then go over the glass with a piece of fresh newspaper, till it looks clear and bright. The insides of windows may be cleaned in the same way; also spectacle-glasses, lamp-glasses, etc. White paper that has not been printed on is better;—but in the absence of that a very old newspaper, on which the ink has become thoroughly dried should be used. Writing paper will not answer.

**PRESERVED WATERMELON RINDS.**—Cut the rinds into squares about an inch thick; boil in alum water a few minutes; then rinse in cold water, and drain. Make a syrup of equal weight of white sugar; boil until clear. When cool, add a little essence of ginger, or what is better, when the preserves are to be used, add a little extract of lemon.

**ONION SOUP.**—Alexander Dumas recommended onion soup as an infallible remedy for nervous prostration, headache, and debility. He prepared his soup, which has become quite famous among the gourmands of the French capital, of cream and onions.

**SUNDERLAND PUDDING.**—Six eggs, whites and yolks beaten separately; one pint of sweet milk or cream; three tablespoonful of wheat flour; a little salt. Add the whites lastly. Bake twenty-five or thirty minutes.

**GRAHAM BREAD.**—Two cups of sweet milk, two cups sour buttermilk, one-half cup molasses, one teaspoonful of soda, with unbolted wheat meal to make a stiff batter. This cannot be heated for bread.

**APPLE JELLY.**—Slice apple without paring, hoil till tender, then strain, and take  $\frac{3}{4}$  pints of juice to one pint of sugar; hoil about twenty minutes.

### Mechanical Hints.

**TO MAKE TUNGSTIC GLUE.**—Tungstic glue hides fair to be an acceptable substitute for hard india rubber, now so high in price. It is prepared by mixing a thick solution of glue with tungstate of soda, and hydrochloric acid, by means of which a compound of tungstic acid and glue is precipitated, which at a temperature of 86 to 104 Fahrenheit, is sufficiently elastic to admit of being drawn out into very thin sheets. On cooling, this mass becomes solid and brittle, and on being heated is again soft and plastic. This new compound, it is said, can be used for all the purposes to which hard rubber is adapted.

**HOW TO RENOVATE WORN OUT FILES AND RASPS.**—Boil the file in a very strong solution of soda, or, what is better still, soap-boilers' soap lees, which removes all the inherent dirt. It must then be allowed to remain for about half a minute in a solution composed of two parts of water and one part of nitric or muriatic acid; and after that washed with water, and slightly brushed over with oil of turpentine. To show the efficiency of the diluted acid in producing a keen edge on instruments, dip therein a round pointed needle, or worn knife, and the result will be satisfactorily seen.

**MARINE GLUE.**—The following receipt is said to be an excellent one:—Take of coal naphtha, 1 pint, pure (not vulcanized) rubber, 1 ounce, cut in shreds; and macerate for 10 or 12 days, and then rub smooth with a spatula on a slab; add at heat enough to melt, 2 parts of shellac by weight, to one part of this solution. To use it, melt at a temperature of about 248° Fahr.

The cabs in New York City are painted dark red, and striped sparingly with black. Vermillion broad lines, and carmine glazed on vermillion, are still used to some extent. Blue on panels, and for broad lines on the carriage part, may be occasionally met with.

If a coat of varnish be not rubbed down level, and freed from all grit and scratches, it may not be expected of the next coat that it will be perfect.

## LIFE THOUGHTS.

WHAT is virtue but a medicine and vice but a wound.—*Hooker.*

THE childhood shows the man as morning shows the day.—*Milton.*

ETERNAL life is spiritual substance, present and incident to the possessor.—*E. H. Chapin.*

THE mere learning of language is like expending one's money for handsome purses.—*J. P. Richter.*

REAL happiness is cheap enough, yet how dearly are we in the habit of paying for its counterfeit.—*Ballou.*

WOE to the physician who does not do his best for the beggar, just as for the millionaire.—*E. E. Hale.*

THE measure of civilization in a people is to be found in their just appreciation of the wrongfulness of war.—*Arthur Helps.*

EVERY newly discovered truth judges the world, separates the good from the evil, and calls on faithful souls to make sure of their election.—*Julia Ward Howe.*

If you can but give to the fainting soul at your door a cup of water from the wells of truth, it shall flash back on you the radiance of God. As you save, so shall you be saved.—*Conway.*

HE who begins by loving Christianity better than truth, will begin by loving his own sect or church better than Christianity, and end by loving himself better than all.—*Coleridge.*

### Singleness of Object.

In the work of life, the great secret of success in any undertaking lies in a concentration of one's powers upon a single object. One may have talent and wealth, but if he has no well-defined object, toward which all his energies are bent, the world would be nearly as well off without him. There is a beautiful illustration of this principle in the burning glass. A single ray reflected from its surface is almost imperceptible in its effects; but when many are concentrated upon a common point, they produce a heat so intense as to fuse the hardest metals.

Perhaps there are men who have succeeded in more than one kind of business, but are there not scores all around us who have failed? Again there are those who, after years of toil and application to a single object have made but little advancement. Is the fault in the effort, or in the object? Have they not cherished some pet scheme in opposition to their own reason, some wild theory without foundation? Is it right to bring up, as evidence, the case of a man who has spent his whole life in an attempt to discover perpetual motion, or in some other pursuit equally absurd, and call it a failure? This is "hobby-riding" not an earnest attention to business.

**HOW SOON FORGOTTEN.**—So lately dead; so soon forgotten. This is the way of the world. Men take us by the hand, and are anxious about the health of our bodies, and laugh at our jokes, and we really think like the fly on the wheel, that we have something to do with the turning of the earth. Some day we die and are buried.

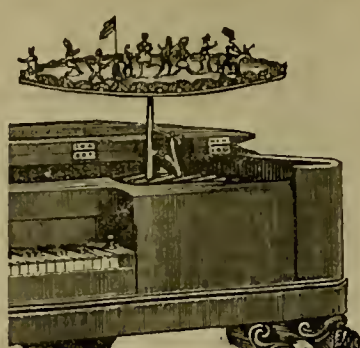

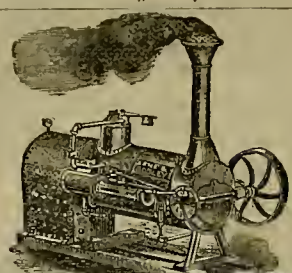

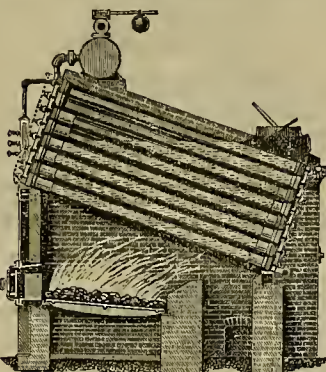

The sun does not stop for our funeral; everything goes as usual; we are not missed in the street; one or two memories still hold our names and forms; but the crowd moves in the daily circle, and in three days the great wave of time sweeps over our steps and washes out the last vestige of our lives.

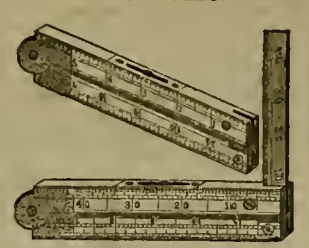

**HOW TO KEEP A SITUATION.** Lay it down as a foundation rule, that you will "be faithful in that which is least." Pick up the loose nails, bits of twine, clean wrapping paper, and put them in their places. Be ready to throw in an odd half an hour or hour's time when it will be an accommodation, and don't seem to make a merit of it. Do it heartily. Though not a word he said, be sure your employer will make a note of it. Make yourself indispensable to him, and he will loose many of the opposite kind before he will part with you. Those young men who watch the time to see the very second their working hour is up—who leave, no matter what state the work may be in, at precisely the instant—who are lavish with their employer's goods will always be first to receive notice that times are dull, and their services are no longer required.—*Workingman.*

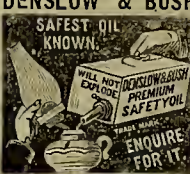

**WORK.**—There is a perennial nobleness and even sacredness, in work. Were he never so benighted, and forgetful of his high calling, there is always hope in a man that actually and earnestly works; in idleness alone there is perpetual despair.

MANUFACTURERS OF  
**U. S. STANDARD BOXWOOD AND**  
**IVORY RULES.**  
  
ALSO EXCLUSIVE MANUFACTURERS OF  
**L. C. Stephens' Patent Combination Rule.**  
This cut represents the COMBINATION RULE, which  
comprises a Foot Rule, Spirit Level, Try Square, Bevel,  
Plumb, Slope Level, Etc.  
It is made of the very best quality of Turkey Boxwood,  
heavily bound with brass, and is graduated with mathe-  
matical accuracy.  
The Square is adjustable, and can be tested and made  
perfectly true by the aid of a small screw-driver, but this  
is seldom required.  
In its application as a Slope Level it is especially  
adapted for Miners' use, as it shows the PITCH to the  
foot, and DEGREE of INCLINATION at once. It is six  
inches long when folded, by one and three-eighths wide,  
and three-eighths inches thick, the cut being just one-  
fourth size.  
By the use of one of these, a builder, mason, car-  
penter, or other workman, can always have in his pocket  
the most valuable of his apparatus used in construction,  
combined in a portable, useful and cheap form.—Scientific  
American.  
Price by mail, prepaid, \$4. For agents' terms, address

Dr. MacGoway; for essays on insect wax, grass cloth, artificial manufacture of pearls, feather work and tree tallow, all of Chias, \$200.  
A. J. Bigelow; for best method of clearing and cultivating tule lands, \$100.

## Scientific Lectures.

The want of an Evening School in this city, which young men employed during the day might attend, for the purpose of acquiring a thorough acquaintance with the present state of science, has been greatly felt. This deficiency has now been met, we are glad to see, by the establishment of a class at the St. Ignatius College, on Market street. The instruction will embrace a complete course of physics and chemistry, adapted to older students of ordinary intelligence, and the subjects will be illustrated by numerous experiments. The lectures will take place every Monday, Tuesday, Wednesday and Friday evenings, beginning at 7½ and ending at 8½ o'clock. To those desiring to perfect themselves in metallurgy and mineralogy, this class affords a splendid opportunity, and for these branches, destined to become of the utmost importance on this coast, a knowledge of chemistry is indispensable. We have had the pleasure of examining the laboratories and extensive apparatus of the College, and from that fact are assured that nothing will be wanting to render these lectures both interesting and instructive. An extensive mineralogical cabinet, containing specimens from all parts of the world, will facilitate the studies connected with geology and mineralogy. These lectures are not for young men only; but for all whose tastes lie in that direction.

LOS ANGELES.—The grape crushing season has commenced here. A reliable estimate of the crop near Anaheim, is, that it will be only two-thirds that of last year owing to the ravages of grasshoppers and the dry season. At Cocomungo Beach and vicinity the grasshoppers were only checked by ditches. The loss there is greater than at Anaheim. A single wine grower in the Los Angeles valley expects to realize 200,000 gallons. The total wine yield of the county is estimated at from a million to a million and a quarter gallons.

INACCURACIES OF THE CENSUS.—Great complaints have been made of the inaccuracies of the last census. So imperfect was it shown to be in Philadelphia, that the Census Bureau ordered a new census for that city, which resulted, among other facts, in advancing the value of the annual manufacturing industry of that city from \$206,000,000 to \$326,000,000—an increase of about 60 per cent.

WHEAT FROM CALISTOGA.—The shipments of wheat from Calistoga during last week averaged about fifty tons per day.

## Our Printed Mail List.

Subscribers will notice that the figures found on the right of the printed slips, represent the date to which they have paid. For instance, 21st/70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4/72, that he has paid to the 4th of January, 1872; 4/72, to the 4th of July, 1873. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction. Please notify us if you are not properly credited within two weeks after paying.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

W. H. MURRAY—General Traveling Agent.  
TALBOT P. POWERS—Solana and neighboring Counties.  
I. N. HOAG—Sacramento, General Agent.  
F. M. SHAW—San Diego.  
L. P. McCARTY—California.  
T. W. DEVLAND—California.  
M. W. LEVY—Denver, Colorado.  
M. H. STAMM—Pacific Coast.  
T. POYER—California.  
Wm. J. CLARK—California.  
JOSEPH DIMMICK—California.  
E. P. HICKS—California and Oregon.  
A. C. KNOX, City Soliciting and Collecting Agent.

SUBSCRIBERS should send former address, when ordering the paper sent to a new place. Returning a newspaper or blank slip, WITHOUT THE NAME AND RESIDENCE OF THE SUBSCRIBER is a thoughtless act, and useless both to subscriber and publisher.

Complete Volumes of the Scientific Press from January, 1864, can be had at this office at \$3 per volume. Bound in cloth, \$5. A limited number only on hand.

IN COLORADO.—Mr. W. H. Murray, special agent and correspondent for the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS of San Francisco, left copies of his journals when he was here, and judging from these numbers, much valuable information regarding irrigation and mining can be obtained by reading them. The interests of California and Colorado are identical, and the people should become more acquainted with each other.—Greeley Tribune, Colorado.

UNIVERSITY OF CALIFORNIA.—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-keeping are taught.

Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TARR, Oakland, Master Fifth Class.

N. Selbert's Eureka Lubricators for steam cylinders are acknowledged by all engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not rust or gum, and will pay for themselves in a short time, in the saving of oil, over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First street, San Francisco. 8v23-3m

A UNIVERSAL REMEDY.—"BROWN'S BRONCHIAL TROCHES," for Coughs, Colds, and Bronchial Affections, now stands the first in public favor and confidence; this result has been acquired by a test of many years. Its merits and extensive use have caused the Troches to be counterfeited, and we would caution purchasers to be on their guard against worthless imitations.

SUCCESS IN BUSINESS.—Success in the business world usually depends upon being thoroughly prepared for its duties. Young men! if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24 Post street, San Francisco. This is the only school on the Pacific Coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book-keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which cannot be discussed here. Call at the College and examine its workings. If unable, send for circular, and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address E. P. HEALD, President, Business College, San Francisco, Cal. 10923p-3m

PLACERVILLE, Sept. 1, 1871.

MESSERS. DEWEY & Co.—Gentlemen: I am happy to acknowledge the receipt of my Letters Patent for my Self-Operating Gas Burner; and for the manner in which you conducted the case, I will say that it is entirely satisfactory; and I can assure you that I will recommend others to you who have Patents to obtain.

Yours respectfully, C. B. BROWN.

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. ORDERS from the country attended promptly. 8v23-3msa

READERS will favor advertisers by mentioning the information gained from notices in our paper.

W. H. CORBELL, Pres't. F. MALOON, Sec'y.

## Pacific Bridge Company

Are prepared to build Wooden and Iron Bridges on SMITH'S PATENT TRUSS PLAN.

Plans and specifications furnished to counties or persons desiring to build. Lithographs and prices sent on application.

Smith's Cast Iron Pier, durable as stone, and adapted to resist rapid currents, put in at low rates.

Address PACIFIC BRIDGE CO., 3v23-3m-cov Oakland Cal.

## STANDARD American Billiard Tables AND COMBINATION CUSHIONS!

Endorsed for Accuracy and Durability by all the best players. Tables of all Sizes, Styles and Finish. Particular attention is called to our NEW DESIGN. Patented June 6, 1871.

Balls, Cloth, Cues and every article relating to Billiards, for sale by GEO. E. PHELAN, 11v2-5mhp 541 Market street, San Francisco.

The Great Equivalent.—The world may be safely challenged to produce so perfect a simulation of anything in nature, as

Tarrant's Seltzer Aperient

Is of its original, the Seltzer Spring of Germany. The Aperient, based on a correct analysis of the Seltzer Water, is even superior to the manufacture of Nature herself, because it contains all the active medicinal properties of the spring, unalloyed by any of the inert and useless particles found in all mineral fountains. The GENUINE ARTICLE BEING SECURED, you have the Seltzer Water of Europe, purified and perfected, and probably the best, the most genial cathartic and antilithic preparation on the face of the earth.

SOLD BY ALL DRUGGISTS.

## The California Powder Works

No. 314 CALIFORNIA STREET. SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER, FROM THE SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

## Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

## HERCULES POWDER,

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office. 16v20-3m JOHN F. LOHSE, Secretary.

## ACTIVE MEN!

With Experience in Canvassing business, can now obtain lucrative and permanent employment by DEWEY & CO., Patent Agents and Publishers of the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS, No. 414 Clay street, S. F.

## Mining and Other Companies.

On account of the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

## Alameda Coal Mining Company—San Francisco and Alameda Counties, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 7th day of September, 1871, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, 409 Battery street (first floor), between Clay and Market streets. Any stock upon which said assessment shall remain unpaid on the 7th day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 30th day of October, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

M. PHILLIP, Secretary. Office, 400 Battery street, San Francisco, Cal. se104w

## Bellevue Mining Company—Location of works, Ophir District, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of August, 1871, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 409 California street (up stairs), San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 3d day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 30th day of October, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

T. F. CRONISE, Secretary. Office, 409 California street, San Francisco, Cal. se24w

## Jeinsen Lubricator Company.—San Francisco, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 1st day of August 1871, the several amounts set opposite the names of the respective shareholders, as follows:

**GARRATT'S CONDENSING LUBRICATOR,**

Or "TALLOW OUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION.—D, is a glass chamber which contains the lubricant. O is a valve, connecting with cap which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted siphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the siphon of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. fe18-ff

# THE PATENT Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.  
For further information apply to  
**R. STONE,**  
25v22-3m 422 Battery street, San Francisco.

# CRAIG & BREVOORT'S Patent Condenser for Steam PUMPS, &c.

NO. 1.

The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have. W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as a guide to float F.

The valve, G, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.

NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is specially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address

# HUGHES' PATENT

# REMOVABLE GLOBE LANTERN.

Since the time when King Alfred made the first lantern by surrounding a candle with a transparent casing of horn, this class of appliances has been one of the greatest utility and most extended use. Among the latest improvements in its construction is that illustrated in the accompanying engravings, and designed to secure the threefold object of providing for the easy cleansing of the glass portion, the secure retention of the upper in place upon the lower part of the lantern, and the affixing of the hall to the top of the lantern in a durable and efficient manner. The base of the lantern is provided with the usual detachable lamp, and at one side has hinged to its upper edge a wire frame designed to carry and protect the glass portion or body of the lantern, and at the upper end of which is the cylindrical top, perforated in the ordinary manner to permit the escape of the products of combustion from the lamp. Arranged at that side of the base opposite the hinge is an angular spring-catch or applied as to catch over the annular lower rim of the wire frame, and in conjunction with the hinge, to hold the said frame firmly in place upon the base as required when the lantern is in use.  
This Lantern is offered as

The Best and Most Desirable in Use,

all things considered. Its price is reasonable, and when once tried no other will be accepted.

Individuals, Dealers, Railroad Companies, and all persons and institutions about to purchase Lanterns, should inquire for this kind; and if not for sale in your locality, address the inventor for circular of full description, price list, etc.  
Patented August 10 and December 28, 1860, by

# Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of the value of the machine. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.  
Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.  
Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

Dewey & Co., U. S. and Foreign Patent Solicitors and Counsellors, Scientific Press Office. Principal Agency for the Pacific States. Established 1860.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. ADVICE AND OPINIONS FREE. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. ENGRAVING ON WOOD, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in colors, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals. Publishers, Patent Agents, and Engravers.

IMPORTANT TO MINERS.

A CHEAP AND DURABLE DEVICE FOR SAVING FINE GOLD AND QUICKSILVER. Frey's Improvement on Evans' Undercurrent Sluices.

This is a sluice made of cast-iron, with transverse corrugations on the bottom, semi-circular in shape and three inches deep. At the bottom of each alternate corrugation is a narrow slit through which the heavier material falls down into another sluice below with larger corrugations. Both riffles are set on the same grade, which should be about one foot in twelve. The lower box is charged with quicksilver. These Sluices do not cake, nor do they require any attention beyond cleaning up once a week. These sluices have stood the test of use in quartz mills below all the contrivances for saving gold and have made large returns of gold, silver, concentrated sulphurates and quicksilver, that would otherwise have been lost. From the Green mine, Ophir District, Placer county, I have received the following certificate:

Ophir, August 5th, 1871.  
Dr. Jos. M. Frey—Dear Sir: Having been engaged as assayer in Green & Co.'s mill, where we are using the Hepburn pump and settler, and having below the settler a set of Frey's Undercurrent Sluices and Riffles, I am well satisfied, after some six or seven years experience in the use of various modes and machines for amalgamation of ores, that your Riffle is capable of concentrating and saving most of the fine quicksilver and light amalgam, in which consists the great source of loss in every known process of working ore.

(Signed) Yours respectfully, J. R. MORRIS, Works, 21 First street, San Francisco.

Dear Sir: Having had opportunity to watch your Corrugated Riffles, in operation for over a month at Reno, I can say that these Riffles work splendidly as quicksilver savers and concentrators of unroasted ore. I have also no doubt that they could save very fine gold, as for instance in black sand or slimes, better than any like apparatus in use. Respectfully, (Signed) E. N. ROTTIE, Assay of tailings saved at the Rhode Island Mills, Nevada, by these Sluices:

Gold.....\$75 24  
Silver.....76 96  
Quicksilver.....250 lbs. to the ton  
This was the saving of one week.

For further particulars address WATERS & CO., No. 54 J street, Sacramento, the Agent for the State. 12v23-3m

## Rail and Car Mortising Machine.

This machine is of a heavy and substantial description, as may be seen by the accompanying illustration. It is built upon a column of cast iron, the mandrels carrying the auger and the chisel stand, seven inches from the fall thereof. The carriage, which has a suitable vertical adjustment, will receive timber sixteen inches wide. Chisels of any needed width may be used, a three-inch mortise in hard oak producing no concussion to the foot of the operator and no injury to the machine. The stroke is four inches, but may be increased to seven inches or less, if desired. The auxiliary boring apparatus, by means of levers easily handled, has a horizontal adjustment of sixteen inches, and a vertical motion of the same amount, using augers of that length; with it all holes needed for bolts or other purposes may be bored whilst the timber is in hand for mortising.

There are several different classes of these power mortisers—those for agricultural implement works; wagon and hub factories; furniture and carpenter shops, and the one represented in our cut. The excellence of these machines consists in the automatic graduation of the stroke, perfect subjection to the will of the operator, and absence of any jarring to the foot of the workman, even in working hard wood. The machines are built with iron columns, and the carriage is set to the proper elevation and firmly held, without the use of bolts. The cut of the chisel is initiated as in the foot mortising machine, each stroke descending deeper and deeper, but always rising to the same altitude—as the treadle is gradually depressed until the maximum is reached. This is accomplished through the action of the treadle upon the toggle joint in moving a sliding wrist upon the vibrating arm, to a point more and more remote from the center, the increasing leverage of the toggle joint, as it is straightened, presenting a more powerful resistance to the return of the wrist as the labor of the chisel increases in severity. When the pressure of the foot is removed from the treadle, through the action of a weight the toggle joint resumes its normal position, retracting the sliding wrist until its center coincides with the center of motion in the vibrating arm, instantly arresting the chisel at the highest point of its range and without any concussion. For further information concerning this machine, address Lane & Bodley, corner John and Water streets, Cincinnati, Ohio.

TEA.—Great Britain consumes four times as much tea as the United States.

MINING MACHINERY FOR CARIBOU.—The Prince Alfred on her last trip, took up a steam pump and hoisting machinery of 20-horse power for the Black Bull Mining

INDUSTRIAL FAIR IN MONTANA.—The Second Annual Fair, of the Montana Agricultural, Mineral and Mechanical Association, was opened at Helena, M. T., on

## New Silver Ore Chloridizing Process.

An ingenious method of roasting and chloridising silver ores in a mass, and without stirring, the invention of Mr. Crosby, is said to have been successfully tried in Colorado. The process may be referred to that of cooking in square ovens, and is equally simple. The ore chamber is of oblong form, 10 feet long, 7 feet wide, and 10 feet deep, and has a perforated floor made of bricks or tiles, with 2-in. holes, about 7 in. apart; doors are provided on each side of the chamber for drawing the charge. Underneath the perforated floor are fire boxes, the flues of which are made to pass under the floor of the chamber. Round wooden 2-in. poles are placed upright in the perforations in the bottom, and held in place by wire or light hoop-iron, passing across the top of the chamber. These being in position, and the side doors closed, the furnace is ready for charging.

The ore to be treated is prepared by mixing with it about 10 pounds to the ton of cut straw, hay, or other fibrous vegetable material, with the necessary quantity of brine, the whole being moist enough to pack well. When the chamber has been charged by shoveling in the mass around and among the poles, the poles are withdrawn and a slow fire applied beneath. The flame and heat pass under the ore chamber, and thence upward, through the ore by means of the openings left by the removal of the poles. The moisture is rapidly expelled, and the flame then attacks the straw incorporated with the charge. As this burns out innumerable little flues are formed, which not only lead the flame through every particle of the mass, but form avenues for the escape of sulphur and other volatile matters. A charge of 40 tons of ore can be treated in from 48 to 60 hours, and the consumption of fuel is from one-eighth to one-tenth of a cord of wood for each ton of ore.

The cost of a 40-ton furnace will vary from \$1,750 to \$2,500, and in its use it is claimed to be extremely economical; it is also claimed that it provides a way for the treatment of low grade ores that cannot be profitably handled by any other method; as the ore must be wet when put into the furnace, it can be used by either dry or wet crushing mills, the latter being at no expense for drying ore; whilst the furnace may be made of either brick or stone, requiring no power, and having no iron work exposed to the fire, the grate-bars excepted.

THE discovery has been made by Captain Ericsson that the heat of the sun is 4,060,000 degrees Fahrenheit.

LANE & BODLEY'S POWER MORTISER.

Company in Caribou, and it is said that other companies in that section of country intend also to ship machinery from here. Thus it will be seen that all developments in mining regions on this coast, no matter how far off, contribute something to our industrial prosperity. The Lane & Kurtz company of the same place have sunk 64 feet on their ledge and their steam machinery is operating successfully.

the 25th of September, and will continue six days. The awards in the different departments will consist mainly of cash premiums. We expect to be able to give some account of the proceedings.

CARBOLIC acid sprinkled in small quantities about a room will abate those intolerable nuisances, fleas and mosquitoes.

## MECHANICAL PROGRESS.

### Coal Dust as Fuel.

We have frequently, within the past two or three years alluded to the progress of experiments in utilizing pulverized coal-dust as fuel; always holding the matter to be of great industrial importance. It appears from the *Am. Railway Times* that the chief credit of this improvement is due to Mr. Whelpley & Storer of Boston, who have been experimenting in the matter for the last ten years, and that they have now almost completed arrangements for introducing it into general use.

They have protected themselves with some 40 American patents, besides securing patents in most foreign countries. They have just sold to a company of capitalists the "right to use their patents in New England; and are now negotiating for sales in California, Pennsylvania, Ohio and other States. Their patents cover devices for its use for puddling and other furnaces, and for locomotive, marine and stationary boilers.

They claim an economical advantage of 30 per cent. over ordinary fuel expenses for boilers, and from four to five dollars per ton economy in working iron. The advantage of such a method of burning coal, if it has been made practicable must be apparent to every one conversant with such things, and there appears to be high authority for the assertion that they have fully overcome all obstacles in the way of its practical introduction. We know of no invention of late years that seems to promise more than would the successful introduction of pulverized coal for steam fuel, and for furnace operations. We hope soon to be able to give a full description of the application of the invention.

### Berlin Iron Castings.

The delicacy and beauty of outline characterizing the Berlin iron castings have given them a world-wide reputation. The minutest details are sharply defined, and the entire surface has an admirable bronzed-like smoothness, resembling works of art. It has been generally supposed that this kind of work was made by mixing with the iron some metalloïd, which has the effect of giving to the metal more fluidity and density; this appears, however, not to be the case—they being made of iron alone, and perfected in the processes of manufacture by the ingenuity of M. Schott. His attention, it is stated, was first directed to the importance of procuring the finest quality of moulding sand made by mixing burned clay with pulverized sandstone, having a maximum porosity. It has also the fineness of grain so essential for delicate moulds. The most important part of the process, however, is the preparation of the metal. M. Schott made a series of experiments to determine the melting point of different kinds of pig iron, and by mixing several in proper proportions, he found it practicable to vary the melting point at will. Indeed, his experiments proved that the melting point of different samples of charcoal iron, made at his own blast furnaces, varied more than eight hundred degrees Fahrenheit. The iron ore used by him is not different from that found in many other places. It is reduced in a series of small charcoal furnaces in the vicinity of the mines, which are situated in Northern Germany, near the town of Brunswick.

**WATER AS A SUPPORT FOR BEARINGS.**—Experiments have recently been made, with considerable success, in the introduction of water as a support for the journal of a shaft. Lubrication by water has often been practiced, especially upon car-journals, a continuous stream being directed upon the bearings; but although it is claimed to have proved entirely satisfactory in its results, reducing the friction and at the same time preventing the heating of the journals, it does not appear to have met with general approval among engineers.

The more recent modification of the method above referred to consists in forcing a stream under pressure beneath the journal, lifting it clear of the metal of the box. This has been done with excellent effect in the case of vertical shafts, a valve being introduced by which the water

escapes whenever the pressure exceeds a certain limit. If an ample supply of water is provided, it will thus constitute a steady and uniform bearing for the shaft, both the heating and friction being avoided. The friction is not actually done away with, in the strict sense of the term, but merely transferred to the pump by which the water is supplied and the upward pressure exerted on the journals.

### A Piano Without Strings.

For more than a hundred years innumerable attempts have been made to discover a substitute for the string in pianos. Without the discovery of such a substitute, all attempts to construct a steel instrument would only be partial successes. The essential points in a new sound medium for this purpose, without either of which it would be useless, being, that it must furnish a compass of from six to seven octaves; that it may be operated upon by an ordinary pianoforte action; that it shall occupy no more room in the instrument (laterally) than the key board; that it may produce a tone at once pure, free from harmonies other than those necessary to produce the proper quality of tone or "tone clang," free from the disagreeable sound of the hammer on the sound board, and of the proper sonorous power; that the instrument constructed with such a sound medium may be simple in construction, not liable to get out of tune, to break, or deteriorate, nor occupy too much room, not be too heavy, and at the same time be cheap and durable, and that the sound medium may be mounted on an iron plate, and yet effect a communication with the sound board. All of these points the inventors claim for their new steel piano.

If these claims be fully established, a struggle between the steel hook and the steel string will commence, with the chances in favor of the former. That this new instrument must prove a formidable rival to the piano, the inventors claim is evident from the fact that unless the piano was not known to be so defective, no attempts would ever have been made to discover a substitute for the string.

The peculiar, unpleasant tone of the stringed piano is caused by the shock of the hammer on the sound board, imparted through the action of the tightly drawn strings. If this noise, so unpleasant to a fine ear, especially in old instruments, could be separated from the genuine tone of the string, the instrument would still be exceedingly weak in tone. In the instrument under consideration, this disagreeable noise is said to be obviated, as the metal plate only transmits musical vibrations, not noise.

The steel hook can also be used in combination with reeds, as it is the only sound medium of a full compass that will keep in tune with reeds. The power of the new instrument is said to be only limited by the quality and size of the steel hooks, the power of the action, the space within the instruments, and the quality of the sound board. The hooks are attached to a metallic frame or bridge, which is fixed to a sound board in a vertical position.

The *Scientific American*, from which we quote, says the acoustic principle adopted is scientifically sound, and is inclined to believe that a good and powerful toned instrument can be made in the manner indicated. Only one instrument has thus far been constructed, and that under the immediate supervision of the inventors themselves, Messrs. Thos. Atkins and Henry Drewer, Cincinnati, Ohio, the accounts of which the *American* thinks are highly flattering to the success of the instrument.

**WOODEN SHIPS.**—A leading Maine paper, in a thoughtful and elaborate article on the subject of wooden ships, states that the depression in that class of shipping is represented as being much worse than it really is, and that the complaint that ship-building is dull and ship-yards are deserted, comes from outside of the United States, as well as inside. In Canada, where the alleged disadvantages under which our ocean ship-builders labor, do not exist, the business is fully as dull, and the papers of New Brunswick and Nova Scotia equally complain. In many places where ten vessels were formerly employed, hardly one is now used. The days when wooden sailing vessels were the chief vehicles of commerce are past, just as the old stage coach has been superseded by steam, and is now but comparatively seldom brought into requisition. It appears, too, that the profitability of ship-building has been greatly overrated, and that the country has actually suffered but little from its decline.

## SCIENTIFIC PROGRESS.

**NEW MODE OF OBTAINING THE EXTRACT OF HOPS.**—Mr. W. S. Newton, of England, has proposed and patented a new method of extracting the useful substance of hops. The process is based upon his discovery that the light products of petroleum, naphtha, etc., are rapid and complete solvents of the essential oils and of the bitter principle of hops, while at the same time they have no solvent action on the other constituents of the plant, which are either useless or hurtful. The hops are simply steeped in the naphtha, under a moderate heat. The apparatus employed is similar to that used for hi-sulphide of carbon when employed for similar purposes. The lighter hydro-carbons, those which boil at 100 degrees F., are preferable for this purpose.

**DISTANCES OF FIXED STARS.**—Prof. Safford read a paper before the late meeting of the British Scientific Association in which he proposed a new way to ascertain the distance of the fixed stars. He finds that the solar motion with which our sun is revolving around a center somewhere in the Pleiades, has a velocity six times as great as that of the earth in its orbit. As a base for the calculation of the distances of fixed stars, he considers the solar better than the orbital motion. He has observed for this purpose many groups of fixed stars, his general theory being that those stars which under observation show the greatest motion, are probably the nearest to us.

**IMPROVING THE POTATO.**—Mr. Simpson, an English scientific gardener, claims to have succeeded in materially modifying the character of the potato by, in some way, mixing it with the artichoke, and expresses his intention of displaying some specimens of his improved vegetables at the September meetings at Kensington. Doubts are entertained with regard to Mr. S.'s claims, although it is acknowledged that there is ample room for improvement in that direction.

**TESTING BY MEANS OF THE BLOWPIPE.**—According to the *Chemical News*, M. F. Jean states that sulphuret of sodium is one of the best blowpipe tests, if used in the following manner:—First, a bead is made with borax and the substance to be tested, and this bead, having been made very fluid within the reduction-flame, there is added to it some dry and pulverized poly-sulphuret of sodium, and the bead again heated in the reduction-flame. If the substance under investigation can form a sulpho-acid, there will be formed a soluble sulpho-salt and a clear bead; but when no such salt can be formed, with lead, for instance, an opaque bead will be formed. Iron, lead, bismuth, nickel, cobalt, palladium, thallium, silver, copper, uranium, etc., fused in a bead of borax, to which afterwards, sulphuret of sodium is added, yields a black or brown-colored opaque bead; zinc yields a white opaque bead; cadmium, while yet hot, scarlet red, and yellow after cooling; manganese, a dirty chestnut-brown; gold and platinum, a clear, transparent, mahogany brown bead; tin, a clear transparent yellowish brown bead; chromium, a green bead; arsenic and antimony, colorless clear beads; vanadium and iridium, blood-red beads.

**THE BENEFITS OF SCIENCE.**—The water used by the inhabitants of a certain locality in Philadelphia, among whom several cases of typhoid fever had appeared, was drawn from a shallow well, and was highly charged with various unoxidized compounds of nitrogen. It was suspected that, from some defect, the contents of a public urinal obtained entrance to the well. Professor Church obtained absolute proof by the following method. He introduced two grammes of a lithium salt into the urinal, and, two hours later, was enabled readily to detect with the spectroscope the presence of lithium in a litre of the well water, which by previous examination had shown no trace of this substance.

### The Productive Power of Soils.

Dr. Vöckler has recently given an interesting lecture on the Productive Power of Soils, in relation to the Loss of Plant Food by Drainage, from which we give the following extracts:—The lecturer began by showing the futility of the belief that a soil analysis could reveal whether a land was productive or not. The addition of 3 cwts. of good superphosphate to an acre of soil, 6 inches deep, increases the turnip crop in a favorable season, from 6 to 10 tons. Yet the percentage of phosphoric acid in the soil, was increased only 1-60,000th per cent. by the superphosphate. Chemical analysis cannot detect so small a difference.

The lecturer then discussed the relative values of various mineral salts as manures, quoting the experiments of Lawes and Gilbert, and his own examination of drainage waters. He had found that in whatever form nitrogen is applied to the soil, a large portion of it is always carried off in the drainage, chiefly in the form of nitrates. Nitrate of soda, especially, seems to be rapidly removed by the rain. It should therefore be applied late in the spring, in the middle of March in England. Farm yard manure gives the best results when applied late in the autumn. At all times of the year, but especially during the period of active growth of the crops, nitrates were found in the waters circulating in the land, while ammonia salts are never met in appreciable large quantities. It may be assumed therefore that it is chiefly, if not solely, from the nitrates that plants build up their nitrogenous organic constituents.

The analysis of these drainage waters, showed also that the potash and phosphoric acid are almost entirely retained by the soil, while the less important lime, magnesia, and sulphuric acid pass out more freely.

**NEW FOSSIL CONIFERÆ.**—The last Quarterly Report of the Mining Department of Victoria, Australia contains a matter of considerable interest to Science—a full diagnosis, for the first time given, of a new genus of fossil coniferæ, from the pen of Dr. Von Mueller. They were first found several months ago in one of the lodes at Haddon, by Mr. R. B. Smyth, secretary to the Victorian Mining Department, and during the past year a brief description of these fossils was sent by him for publication in the *Geological Magazine*. The genus has been named by the doctor, *Spondylostrobus*, and, as all the specimens as yet found belong to one species, it has been named after the discoverer, *S. Smythii*. Attached to the observations are a series of drawings of the fossil coniferous fruits found, of different sizes, which give a good idea of its general appearance.

**NEW APPLICATION OF CHARCOAL.**—A new application of charcoal has recently been made in England for the manufacture of a permanent enamel, or varnish for coating the insides of casks. The charcoal, which is made from the wood of *Salix Alba*, is reduced to a very fine powder, and mixed with proper proportions of shellac and methylated spirit. When ready for use it is laid on with a brush, and the inside of the cask is fired, so as to remove the spirit and leave only the lining of charcoal and shellac; it is then coated again and fired a second time, after which it is allowed to stand a short time before being used. This composition is said to form a perfect enamel, and while it prevents any chance of leakage it preserves the casks in an extraordinary manner. It answers admirably for beer and acids, and is largely adopted by some of our principal brewers.

SOME very interesting observations have lately been made on the properties of gun cotton. This substance, obtained with the ordinary process used by the manufacturers of collodion, is not soluble in alcohol; but, with the addition of a little camphor, it dissolves instantaneously. A beautiful artificial ivory is prepared by powdering gun cotton with camphor, and placing it under hydraulic pressure, covering it afterwards with a mixture of gun cotton and castor oil; by this process hilliard balls have been produced, which have been declared by connoisseurs to be superior to those of real ivory.

**TESTING LUBRICATING OILS.**—Some ingenious inventor has contrived an apparatus to test the relative merit of lubricating oils. The point is decided by an indicator that registers the different degrees of heat produced by the action of the machinery during the test, the heat revealing the relative amount of friction, decides the merit of the lubricator used. The invention is to be patented.

# CORRESPONDENCE.

## A VISIT TO TREASURE HILL, NEV.

BY OUR OWN TRAVELLER.

EDS. PRESS:—My last letter was dated from Utah, and here I am now in Nevada for the purpose of seeing the famous White Pine mines. The first in importance on Treasure Hill is the

### Eberhardt and Aurora Co.

This company has bought some of the principal mines on the Hill since I was here last, the Eberhardt and North Aurora consolidated, and 300 feet of the Ward Beecher. Mr. Thos. Phillips of London, Eng., is engineer and general manager; Geo. Attwood of San Francisco, Cal., is milling superintendent; Jos. Petts, chief foreman of the mines on the Hill; John McChrystal is foreman of the North Aurora; Wm. Davis of the Ward Beecher, and John Goodfellow of the Eberhardt.

I visited the mines with the chief foreman, and began by going down the shaft of the Ward Beecher—no doubt the most valuable mine on the Hill. It is located between the Hidden Treasure and South Aurora mines, well known to all of your readers. We descend 50 feet and find ourselves on a platform, where we have a fine view of the mine and chamber; then going down 35 feet more on a ladder, we arrive at the large chimney or ore chamber, which runs north and south. Places can be seen that I would judge were 100 feet in width, 40 in height, and 200 in length, and I am told that nine-tenths of all the rock taken out was good ore. There are 23 men in each shift, at work in this chamber. There are only two heavy timbers to support the roof—all being a capping of lime-rock and very solid. The general character of ore is horn silver and chlorides, resembling the old Eberhardt rock. This company has made some fine developments since they took the property, and their work is being vigorously prosecuted, giving new life to Whitto Pine District. The ore that is being extracted is hoisted from the mine by horse and steam power. They have four shafts, and hoist 130 tons of ore per day out of the Ward Beecher and North Aurora mines, which is carried on the tramway to the mills below, at Eberhardt City. I am told that they have from 5,000 to 6,000 tons of ore in the mine and on the dump, that is broken up ready for shipment. It is good milling ore and averages \$50 per ton. They sent to mill 51 sacks, while I was there, that was expected to yield \$1,500 per ton. There is a fine 20-horse power engine for hoisting—which is the only one on the hill, all the rest being done by horse power. The water used is brought from the White Pine Water Co.'s tank, a distance of 1,800 feet, in a pipe. In the famous

### Eberhardt Mine,

they are sinking on the old Keystone shaft which is looking very well. They are taking out ore daily that will mill \$80 to \$150 per ton, and some much higher. A side track is now being built that will connect with the company's tramway, in order to facilitate the transportation of ore to the mill.

### The Earl Mine,

is located south of the Ward Beecher and is yielding about 40 tons of rich ore per day. There are three shafts in this mine, the main one of which is 116 feet deep. The company have sunk deeper and worked further to the east, and found the continuation of the ore body worked by the former owners. There seems to have been a slide on the hill from east to west, which has carried the croppings a distance of 37 feet, misleading the miners as to the location of the main body of ore. The present owners have shown good judgment and engineering skill, and proven that the body of ore in these large deposits runs down to an indefinite depth. They have built walls, tramways, etc., employing a large number of hands, and have been rewarded for their energy and perseverance. The deposit runs from the north to the south end of the hill, dipping at an angle of 32°, and is bounded on the west by a large spar vein, dipping to the east at the same angle. This spar seam evidently forms the western boundary of all the ore deposits running

north and south in this Hill, and the flats known as chloride, etc. In the shaft I noticed that the old company had followed the main spar seam down for some 40 feet, to the slip that I have spoken of; and, finding no ore after that, it was supposed by some that the deposit had given out. The present owners after a careful examination of the mine, proceeded to drift to the east of the main wall of spar, and struck the body of ore which they are now working, in 37 feet.

## BUSINESS AND MINING AT BELMONT, NEVADA.

EDS. PRESS:—This is at present one of the dullest towns in the State of Nevada. It is difficult to account for this inactivity where one would expect to find all life and bustle; for there is a permanency and value developed in the mining resources of this district which should make the place thriving and prosperous, business good, and property valuable. There have been many causes to produce this state of affairs; but there are none whatever, for its continuance, unless it is the temerity and inertness of some of the principal mine owners.

The failure of the Combination Co., about three years ago, and the poor success of the Belmont Mining Co., may still make the miners distrustful of their own ability to succeed where others have failed. But when companies have failed through the grossest mismanagement and extravagance, it should rather be a source of encouragement. Moreover, during the past three years, improvements in the modes of reducing the ores of this district have been made, so that mines which formerly could not be worked profitably can now be made to pay handsomely. The use of the Stetefeldt furnace here is accomplishing most beneficial results.

### Bad Policy of Mine Owners.

There is an inordinate desire manifested here, among some of the mine owners, to sell their property. They are not satisfied to go to work and mine in a legitimate manner. They unfortunately have heard of grand stock operations in other parts of the country, and they imagine that they too must be at the head of a great company, having its principal office in the City of London, before they can be satisfied to work their mines properly. If their mines were worthless or undeveloped, it certainly would be a wise policy to sell, or have others prospect them. But when the value and permanency of mines are proven beyond a doubt, it only injures their sale to be always hunting a purchaser. The mere fact that such anxiety is shown to sell, makes persons looking for opportunities to invest in such property suspicious that it is not as valuable as represented; and when they join this to the fact that but comparatively little work is being done on these rich mines, they conclude, with almost absolute certainty, that the owners fear they will work their mines out. It requires no shrewd man to make the assertion, that it is folly to allow well developed mines to remain idle waiting for a purchaser, when there is sufficient ore in sight, if properly worked, to pay the price asked.

Having spent several days in examining the mines in this district, I will give you a few items regarding some of the best, thinking it may probably be of interest to some of your readers to know more concerning them.

### The El Dorado South

stands first in the way of developments. It is one of the oldest locations in the district and is owned by the Hon. Robt. Mullen, and Messrs. Leonard and Singletary, who purchased it from the locators soon after its discovery. It has been worked ever since, paying all the expenses for working and improvements, and yielding its owners large profits. The mine has been thoroughly prospected and shows now larger bodies of richer ore than any other mine in the district. The vein matter is in places 60 feet between foot and hanging walls, though only about six feet of it is solid quartz. Rich deposits of chloride ores, however, are found outside of this solid quartz, mixed with broken slate. An incline follows the vein down on the hard quartz, 365 feet, extending 100 feet below the water level.

The vein is found continuous from the surface. At the water level adits are cut north and south—210 feet in all—showing a solid front of ore varying in width from 2 to 9 feet. This body of ore extends to within 60 feet of the surface, where it was first found in the incline. The incline has been well timbered throughout its whole length. Hoisting apparatus, and pumping machinery, with a fine 25-horse power engine, have been erected at its entrance. A great deal of other work has been done on this mine; but at present the work is confined to the 265-foot levels, from which ore is being taken as fast as teams can be procured to haul it to Austin, where it is worked, yielding \$200 per ton. The owners of this mine say that in a short time they will be able to take from it \$30,000 per month.

### The Arizona Mine

is on the same vein with the El Dorado. It belongs now to Messrs. Vellmer and Canfield; contains 600 feet, and was located in 1866. It was owned and worked for three years by a Mexican, Antonio Bergues, who took out \$25,000, working the ore in an arasta. It was purchased about one year ago, by its present owners, who have secured on it an U. S. patent. The pay ore is found in chimneys, three of which crop out on the surface and run in a southerly course through the ledge, growing wide and narrow alternately, so as to form what the German miners call Tinsengange. Two other chimneys of rich ore have been found, which were not visible in the croppings. This mine has been steadily worked during the past year, without levying one dollar of assessment, has paid all expenses and yielded large dividends to its owners. It now shows richer bodies of ore than ever, and the proprietors are confident that they have enough ore in sight to yield them large profits for 8 months to come. The mine can be worked 400 feet below the present deepest workings, before reaching the water level. The ore is worked at the Stetefeldt mill, and is all roasted, though a good portion might be worked without, it being very free from base metal.

### The Silver Bend Co's Mine

comprises 2,000 feet on the celebrated Transylvania ledge. It is the most southerly location on the vein. This mine has been worked more thoroughly than any other in the district. Eight hundred feet of it, only, has been prospected. The ore from this portion of it has nearly all been extracted to the water level. An adit is now being run to develop the southern portion of the mine, which is expected to prove equally as good as that already worked. The Silver Bend was for a long time the chief support of the district, and had other mine owners displayed the same energy and skill in working their mines, that Mr. Canfield has, Belmont would now be a more prosperous camp. The yield during the last year, has been \$130,000. The ore from this mine has been worked at the Stetefeldt mill, of which R. B. Canfield is sole owner and proprietor. The mill was erected in the fall of 1870, has 10 stamps, 8 Freiberg barrels and 2 large settlers. It reduces between 9 and 10 tons of ore per day, and has in connection with it a Stetefeldt furnace, which has a capacity for roasting one ton per hour. It has chloridized the ores, according to statements of average chlorinations made each month, to within 88 and 90 per cent of the assay value. The furnace works in every respect to the entire satisfaction of its owner.

### The Monitor Co's Mine

is on the same ledge with the El Dorado and Arizona, and shows as rich a deposit of ore as any mine in the district. It will, no doubt, in a very short time produce more bullion than any other mine here. Although it was located some years ago, yet it is only very recently that it has produced anything, or shown any bodies of ore worthy of notice. It was purchased about the 1st of June last by Messrs. Sharp, Stein, Roberts, Flagler, and Carroll. Since that time 31½ tons of ore have been worked in Austin, at the Manhattan mill, yielding \$20,235.60 or \$642.40 per ton. Eighty tons more of equally as good ore are now at the same mill, awaiting reduction. The mine is worked through a tunnel 250 feet in length, which tap the ledge 240 feet from the surface. The ledge shows no croppings and was prospected through this tunnel by an adit run from where the vein was first found, 250 feet. The width of the ledge is from 2½ to 30 feet between the walls.

This is doubtless enough in regard to mines of this locality for one time.

H. R.

Belmont, Nye Co., Nev. Sept. 12, 1871.

## Bull Run District.

EDS. PRESS:—All of the mines in this district that are being worked are looking well, and the pack trains are busily engaged in transporting ore from here to the Vance mill at Mountain City. I understand that a rich strike has been made in the Blue Jacket mine, and one also in the Franklin. The Tiger ledge is looking well, and has considerable ore on the dump; which they will ship to Mountain City for reduction. Their last 8 tons yielded \$187 per ton. Good ore is being extracted from the Oregonian, and prospects ahead are excellent. The tunnel on the Lady Don is being pushed with energy. The Johnson mine shows a good body of ore. It is reported that ex-Governor Chellis has made a sale of his mine to an English company for a good figure. I think that most of the mines will be closed up during the coming winter.

CHLORIDE.

Bull Run, Sept. 14, 1871.

## Cotton in California.

We have received another very fine sample of cotton from the Merced plantation of Messrs. Buckley & Strong, and are assured that this experiment has resulted in a complete success, although the season has been the most unfavorable which we have had for many years. A large part of the ground had to be planted the second time, on account of the dry hot winds which, it will be recollected, swept over the country with such damaging effect in the early part of the season. These winds cut down all tender vegetation within the reach of their direct sweep. The ground planted was less than one half that originally intended, on account of the dryness of the season. There has been only a very small portion of the ground irrigated—some 10 out of 70 or 80 acres planted.

Col. Strong is quite confident that he can produce the finest quality of cotton in this State. The sample before us affords ample proof of that. It can also be produced here, the Colonel thinks, 25 to 30 per cent cheaper than it can be grown in the Mississippi valley, on account of the many advantages incident to our climate and other conditions. The planter is not troubled here with rains as he is there, at picking time, which not only seriously interferes with the work of picking, but is also productive of much loss in staining and otherwise damaging the fibre. We have here no army or cut worm to encounter, and but little care or cultivation is needed to keep down the grass which the summer rains of the Southern States so persistently nourish to the great disadvantage and cost of the planter. Cotton cannot be raised there for less than 12½ cents; while eight cents and possibly six may cover the expense of cultivation here.

It is thought that 10,000 acres will be platted with cotton in Merced county, next season, if this experiment turns out according to present promise, and if Friedlander's irrigation canal is completed in season to put out of the way all danger from another dry season. We cannot feel otherwise than confident that we are on the eve of the development of a new agricultural industry on this coast, which will eventually be worth as much to the State as either wheat, wine, or wool.

NIAGARA FALLS.—Scientific men are anxious for a careful survey of Niagara Falls, in order that the changes which are constantly going on there, by the wearing away of the rocks, may be accurately noted. It is also proposed that large photographs be taken of the various points subject to change, with which future photographs, taken from the same points, may be compared.

These falls are making a slow, but sure and steady march up the river; but their beauty and grandeur will never close until the precipice over which they rush shall, in its recession, reach and break through the river-rock and drain off the water of Lake Erie—a result sure of accomplishment at some future time. A series of photographs showing the different phases which the falls must assume in this retrocession, would in future ages be regarded as of priceless value.

# MINING SUMMARY.

THE following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**NEARLY READY.**—Alpine *Chronicle*, Sept. 19th: The Whelpley & Storrer's furnace at the Monitor & Northwestern Mill is nearly ready to start up.

**PROGRESSING.**—Work on the new mill of the Schenectady Co. is progressing finely.

**TARSHISH.**—Monitor *Miner*, Sept. 16th: In the Monitor No. 3 mine on this lode good ore continues to be found at several points. The Silver Glance mine is also showing good ore on two or three levels. The better known Schenectady mine on the same lode is opening out valuable deposits in many directions.

**GLOBE.**—A Steam Pump is to be put in at once and the work of going down on the copper vein, resumed.

**THE NEW MILL** in the lower end of town is being pushed ahead rapidly, a large force being daily at work.

### BUTTE COUNTY.

**QUARTZ MILL.**—Oroville *Record*, Sept. 23d: Col. R. F. Derrick, is erecting a quartz mill of 4 stamps, at Inskip. He has found a large vein of quartz, that prospects well, at the head of Blowhard Ravine, upon which a shaft has been sunk to a considerable depth. The mill is located some 200 or 300 ft. below, and will be propelled by an over-shot wheel, nearly 40 ft. in diameter. The tunnel from the mill to the vein, will be through the bed rock, a species of decayed sandstone, easily penetrated.

**A QUARTZ VEIN** has been discovered near Humbag Valley road, 8 or 10 miles from Carey's Station, which discloses an abundance of crystallized quartz and free gold. Parties are at work, prospecting and developing the ledge. On Saturday last, about \$500, free gold, was taken from the claim.

**ALDER CREEK CO.**—Chico *Enterprise* Sept. 23d: This Co.'s claims, in the Inskip Dist., are prospecting richly. We have seen specimens of coarse gold taken from surface diggings yielding at the rate of 30 cents to the pan.

A few rods below the Alder Creek Co.'s claims, one man with a rocker is taking out from \$8 to \$10 a day.

In the same dist. Williams & Ducey have opened a claim about a mile below Inskip which is yielding handsomely.

### CALAVERAS COUNTY.

**WHAT CHEER.**—Mok. Hill, *Chronicle* Sept. 23d: Everything is being put in readiness for washing. Dump-boxes, and sluices are being constructed.

**WOLVERINE.**—Operations are progressing favorably. The shaft is down 150 ft. It is the intention of the Supt. to put it down 200 ft. before running levels.

The Petticoat has been started up. The water has been taken from the mine and work commenced sinking the shaft. A. E. Kennedy has a contract to put the main shaft down 300 ft deeper which will make it 500 ft. in all. The sinking of the shaft will thoroughly prospect the mine and determine whether the Railroad Flat leads are permanent or not.

**PRUSSIAN HILL MINE.**—On Wednesday we were shown the gold yield of 100 tons of quartz taken from that lode. The rock netted 180 ozs. of gold, worth nearly \$3,100, a trifle over \$30 per ton, unassorted rock. The Co. have a large quantity of quartz in eight, a considerable portion of which will pay \$200 per ton. Work is being vigorously prosecuted.

**GWIN MINE.**—Owing to the scarcity of water but 16 stamps are in operation. The sinking of the main shaft, continues without interruption, and has reached 478 ft. At that point the lode shows better than ever, and the rock being taken out averages more per ton than any previously crushed. 30 additional stamps, making 76 in all, are to be immediately erected.

**ANGELS.**—Cor. San Andreas *Citizen*, Sept. 23d: The Angels Quartz Mining Co. are operating their 30 stamp mill night and day, crushing rock taken from over 400 ft. below the surface. Some of this rock is very rich, showing free gold.

Messrs. Foster have found another rich pocket in their mine. The Stickles Mine has been sold, and hopes are entertained of the erection of another mill soon.

**CUNNINGHAM MINE.**—Four months ago a Co. of miners took a lease of the mine. They have since run a tunnel and struck the ledge, finding first rate looking rock.

**DAM RAISING.**—Nevada *Gazette*, Sept.

22d: The North Bloomfield Gravel M. Co., have filed a notice that they propose to raise their dam at Big Cañon Creek 100 or 135 ft. higher than at present.

### EL DORADO COUNTY.

**GOOD HOPE.**—Downieville *Messenger*, Sept. 23rd: This mine is now taking out splendid rock.

### LOS ANGELES COUNTY.

**BULLION.**—Los Angeles *News*, Sept. 23rd: 364 bars from the Union works, Cerro Gordo, were received yesterday, on the 21st: 215 bars 17,841 lbs were received from the same place.

One hundred bars of silver-lead bullion were received yesterday from the O. L. S. L. Co's works. The aggregate weight was 8,053 lbs.

**BY TELEGRAPH.**—Sept. 21st. Rich silver and galena quartz was brought in yesterday from the new mines found in the mountains, 8 miles from Desert Springs, on the Owen's River road, 80 miles from Walker's Pass.

### NAPA COUNTY.

**Calistoga Tribune**, Sept. 21st: Another rich quicksilver mine has been discovered on Mt. St. Helena, about ten miles from this place. We have seen some of the ore, which is rich in native quicksilver. A company has been formed and work commenced on the mine, a tunnel of 40 ft. having been run in.

### NEVADA COUNTY.

**RUMORED SALES.**—Nevada *Transcript*, Sept. 24th: It has been rumored that several of the best mines in this county have been handed to English companies, and the sales will be completed in a few weeks. One company sells for \$1,000,000, another \$450,000 and another at \$300,000.

### SAN DIEGO COUNTY.

**BULLION.**—San Diego *Union* Sept. 16th: Bullion amounting to \$5,500, was shipped through W. F. & Co.'s Express yesterday, to S. F. principally from Julian.

**RICH ROCK.**—McMahan's mill at Julian City has just cleaned up, after crushing 30 tons of Golden Chariot ore, which yielded \$4,630, an average of \$156 to the ton. The mill is engaged upon Redman ore, over 200 tons being ready for crushing. The owners of the Kentuck lead are taking out rich rock.

**ITEMS.**—All the mills at Julian and Banner are busy at present. The Antelope recently started crushing ore from their own lead, which will go \$50 to the ton. They have plenty on the dump, which awaits crushing. The mill of Gunn, Reynolds & Co. is now running on "San Diego" rock. The Stonewall Jackson mill is always busy and is now at work on ore taken from the "Stonewall." This lead is full 12 feet wide and the ore will average \$30 to the ton. The well from which the mill receives the water it uses, is 100 feet deep, and is to be made 100 feet deeper. The Parsons' mill, is crushing ore from the Owens mine, having just finished a lot of ore from the Helvetia. This latter Co. has a large amount of ore on the surface, which will be crushed at the mill of Gunn, Reynolds & Co.

### SISKIYOU COUNTY.

**PAYING WELL.**—Yreka *Union*, Sept. 23d: The Oak Grove claim on McAdam's Creek is paying well. Carroll & Co.'s claim is not being worked.

### TRINITY COUNTY.

**PREPARING FOR WINTER.**—Weaverville *Journal* Sept 23d: All the miners in Weaver Basin are now engaged in cutting bed-rock and doing other work in the way of preparing for the winter.

### YOLO COUNTY.

**COAL IN CAPAY VALLEY.**—Woodland *Mail*, Sept. 21st: S. Chase, has discovered a ledge of coal, on the west side of the valley. The vein of coal is supposed to be deep enough to work well and the quality is good. It was tried at the blacksmith shop at Capay City, and proved to be excellent. Mr. Chase says that he thinks the coal is inexhaustible. R. Anderson, has also discovered a ledge of fine coal, and has proved it to be of the best quality for welding iron.

## Nevada.

### EUREKA DISTRICT.

**Eureka Sentinel**, Sept. 19th: \$30 silver ore is being thrown over the waste dumps in New York Cañon, for lack of cheap means of reducing it.

**STRIKE.**—W. Mooney and J. Magnire, after two days' prospecting in Secret Cañon found fine ore which assayed \$1,000 per ton in gold and \$640 n silver to the ton.

**MARYLAND MINE AT PINTO.**—A new strike has been made in the old shaft of great richness and extent.

**EXCELSIOR AND GASLIGHT.**—These are the names of two mines on the east slope of Prospect Mt., for which the owners have been offered \$30,000 but desire \$40,000.

In the Excelsior there is a drift driven into the hill, which shows a face of 7 ft. in width of ore, containing both silver and gold.

**DIAMOND MINE.**—The owner has a width of 10 ft. of solid ore at a depth of 20 ft. It is composed of carbonates well mixed with galena, and assays into the hundreds.

**NEW FURNACES AT THE RICHMOND.**—Work is being rapidly pushed forward to completion on these furnaces, and the east or back wall is completed. The erection of the furnaces proper will occupy but little time after starting, as the stone is being got out ready to be placed in position.

**LITTLE GIANT MINE.**—Major McCoy has let a contract to run a tunnel into Prospect Hill to strike the vein of the Little Giant in New York Cañon. The contract calls for 1,000 ft. and when completed will develop a fine body of ore.

**NEW MILL.**—A 20 stamp mill is to be erected at Eureka. The site was purchased on the 20th; and men put to work grading.

**SALE.**—The General Lee Co's property has been sold for a large sum; \$20,000, is to be paid down in cash, the balance on or before Feb. 1st. 1872.

### ELY DISTRICT.

**MEADOW VALLEY MINE.**—Ely *Record*, Sept. 19th: This mine is shipping between 60 and 70 tons of ore to mill per day. The levels and stopes are looking well, and new bodies of rich ore are being discovered. The mill at Dry Valley has only been running 15 stamps for a week or more past, owing to a breakage in the machinery.

### HUMBOLDT.

**NEW MILL STARTED UP.**—Unionville *Silver State*, Sept. 22nd: The new quartz mill, erected by the Batavia & Pacific M. Co., Relief Dist., was started up a few days since, and worked satisfactorily.

### WASHOE.

**AUBURN MILL ROBBERED.**—Reno *Journal*, Sept. 23d: About three o'clock Monday morning, two men, disguised, entered the Mill, bound and gagged the amalgamator, the only man on duty, then took the bullion almost red hot from the retorts, and placing it in a sack made away with it—about 170 lbs valued at \$1,800. Hotly pursued by officers they buried the bullion, all of which was recovered, and one of the robbers arrested.

**CROWN POINT.**—Gold Hill *News*, Sept. 22d: At the 1,200-ft. level of this mine the ore body is found to extend 60 ft. farther north than in the level above, and it is of better quality. They have drifted into it over 30 ft., and it looks better.

Last week the mine yielded 1,400 tons of ore, valued at \$54,500. The Hale & Norcross yielded 609 tons. The Savage yielded 820 tons, the average assays being \$32 40 per ton.

**CALEDONIA.**—The good body of ore developed at the 400 ft. level of this mine is looking and yielding well. The Sapphire, Ione, and Gold Hill Quartz mills are all being run on ore from the Caledonia.

### WHITE PINE.

**BY TELEGRAPH.**—OUTSIDE DISTRICTS.—The mines 4 miles north of Schell Creek, at what is called North Camp, are being vigorously worked, and are looking as well if not better than the croppings indicated. The South Camp, 12 miles south, from the fact of the extraordinary richness of the ore on the surface, is perhaps attracting more attention than those immediately surrounding it.

Two miles south, is located the town of Queen Springs, surrounding which are some of the best mines in this locality, including the Nutmeg, Citizen, El Capitan, Silver, Chariot, and Leviathan. The Leviathan, recently located, is reported to be one of the finest mines ever discovered in Nevada. All these mines show upon the surface the same character of ore, namely: horn and native silver.

**ECLIPSE MINE.**—The prospects continue looking well. The size of the ledge is 5½ ft. in width—3½ of high grade ore.

**ORE PRODUCTS OF HUMBOLDT Co.**—The number of tons of ore extracted and worked in the county, including that shipped abroad during the two years preceeding June 30, 1871, was 22,874 tons giving an average yield of \$107.31 100s per ton and making in the aggregate the sum of \$2,448,246.

**MILL CITY.**—Cor. same: Central Dist. continues to improve. Clark & Bro. contemplate erecting a mill for the purpose of working the ores from their mines. D. Merritt lately sold his interest in 10 ledges for a large sum. J. Hendria, on the first of last July shipped 6 tons of rock from the De Soto, and returns received Saturday informed him that it had worked \$417 to the ton.

F. F. Osbiston shipped from the same

mine 71 tons of third class ore which proved much richer than was expected, and it is said will consummate the sale of the mine.

**GALENA.**—The Butte mine and mill is at a stand-still, resting under an attachment. The Copper mine still continues to yield its usual quantity of ore.

The White mine, is thought to be one of the best mines in the State.

**DUN GLEN.**—Cor. Winnemucca *Register*, Sept. 23d: In the Tallula mine, a tunnel has been run to strike one of their veins; they are still at it and are now near where they expect to strike the first vein of a series of lodes which show prominently in the upper tunnel. The ore resembles the Sheha, and shipments have been made which yielded from \$5 to \$800 per ton.

Work is going on in a small way on the Anburn, Lady Godiva, Dolphin, and Cambria claims, all new discoveries, which show some very rich ore. The Old Langsyne mine is being put into working shape. Sprague & Co. are erecting the new quartz mill at the same place where the Langsyne mill stood.

### REESE RIVER.

**EL DORADO SOUTH.**—Austin *Reveille*, Sept. 22d: 25 tons of ore just worked at the Manhattan mill, yielded an average pulp assay of \$402.50 per ton.

A big strike has been made in the upper level 240 ft. from the surface and 90 ft. south of the main incline. The ledge is about 4 ft. in width and composed of chlorite and stetefeldite, several assays of which gave an average result of \$2,472.56 per ton, selected ore. There is now upon the dump 3,000 tons of rock that will assay from \$70 to \$150 per ton.

**PROSPECTORS.**—Judge McKenney, R. H. Egleston, H. W. Remington, and W. Remington, left town this morning on a prospecting trip to the range of mountains beyond Mammoth Dist.

## Arizona.

**BRADSHAW DISTRICT.**—The shaft on the discovery of the Tiger lode was down 90 ft. Near the bottom a drift was run 40 ft. north; all the rock taken out contained some native silver, and black sulphurets in abundance. A shaft 450 ft. north has been sunk 39 ft. The rock is similar to that of the Discovery; 800 tons of ore have been taken from these shafts and 20 men are at work on the ledge. The shaft on Beardslee and Co's claim is sunk 60 ft. Select specimens from the Gen'l Crook and La Plata lodes yielded \$2,000 to the ton.

## Colorado.

**CLEAR CREEK Co.**—Cor. Central *Register* Sept. 20th: The Comet lode is now in a fair way to be ranked with the richest in the county.

A limestone ridge has been discovered near Montezuma. The stone is hard blue limestone, and makes excellent lime.

Palmer & Nichols shipped on Tuesday a silver brick weighing 775.30 oz., 812 fine, \$717.99 coin value.

A silver brick from the International mill, weighing 1,170 oz., 819 fine, worth \$1,245.40 coin, from Belmont ore, has been shipped.

**QUARTZ VALLEY.**—The Laughran boys are working the Robert Emmet lode with good results. The shaft is 40 ft. deep, carrying a crevice of pay ore from 12 to 14 inches in width, that yields 4½ oz. per cord under stamps.

**GRAND ISLAND DISTRICT.**—Central *Herald*, Sept. 13th: The Elgin lode is producing a large quantity of ore averaging 103 ounces of silver per ton; 10 tons are on the dump. Mt. Vernon has a large quantity of quartz awaiting reduction.

Forty tons ore are raised a week from the Cariboo mine. The crevice in the main shaft is 5 ft. wide without waste rock; 40 miners are employed in the lead.

Rich lodes are being discovered about Dayton.

Mammoth lode has developed a crevice that assays 600 ozs. in silver per ton. Spotted Tail has been leased and is turning out rich gold ore.

**KIMBER & Co's Polar Star Mill**, 32 stamps, in Black Hawk, runs without intermission, are crushing ore from the Gunnell mine; 12 are running on quartz from Stalker's claim on the California, 8 on Kent Co, and 4 on Whiting ore. The Kimber & Fullerton 15 stamp mill on North Clear Creek is employed on Gregory Second and Puzzle. Grinnell lode is being extensively worked again and is yielding very rich ore.

**MEAD** is running 50 stamps at his mills in Black Hawk on custom ores, principally from the Kansas lode.

An assay of surface quartz from the Switzer lode, gave 434,20 100 oz. of silver per ton (\$564.46). A tunnel is being driven into the mountain to intersect the lode.

Caribou Post, Sept. 19:—It is confidently stated that the losses of the Trojau mine will put up a good stamp mill at Cardinal. LODES.—The Magnolia is attracting attention as a saleable mine. It is opened 20 ft. to a well-defined crevice of rich sulphurets of silver.

The Peabody, a parallel vein, has the main shaft 30 ft. deep. This crevice, carries several streaks of rich sulphurets. In the Sherman a new shaft is being sunk 70 ft. west of the main one, where a large body of surface silver quartz is found near the surface. This is being piled on the dump for market. The main shaft is 70 ft. deep.

## Idaho.

Brown & McGuire continue to take good paying ore from the Little Giant. Peck has again commenced work in the Belle Peck shaft, and is preparing to run his tunnel, and also to take ore from the Udola & Tallula Peck. Operations continue in the Morning Star, Noonday, South Extension thereof.

WARREN'S CAMP, Idaho Co.—Cor. Lewiston Journal, Sept. 9th: Mr. Ironsbeck has 20 men employed in and about the Rescue mill and mine. The ledge is over 2 ft. in width on an average throughout the mine. The quartz now extracted is superior to any found in the ledge. There are 50 others in the district, some of which are superior in gold and silver. Placer mines exhibit an increase in richness.

THE HIO JACET is running night and day, crushing rock from the Rescue ledge, and from indications the yield will be good. They have about 200 tons of the ore at the mill.

## Montana.

Helena Herald, Sept. 14th: The Big Ditch, covering the gold placer fields about Helena, the joint property of Judge Truett and J. S. Atchison has passed entirely into the hands of the latter gentleman for \$15,000.

NEW SILVER MINING ENTERPRISE.—The Imperial S. M. Co., has been organized for the purpose of working the mines of Phillipsburg. They have leased the Saunders Co.'s works and mines at Flint Creek, and other valuable property is now being negotiated for, with good chances of its being obtained.

ITEMS.—Several drains are being worked night and day on deep ground. Rothschild, Edinger & Co., are putting in a bed-rock flume at an expense of \$12,000.

WASHINGTON GULCH.—Cor. same: Sevens, in Clark Gulch, is taking out \$16 per day to the hand and upwards. Stiles, Brigham & Co. are working 4 hydraulics, which pay from \$10 to \$15 per day to the hand. Kroger & Co., are driving ahead in Hog'm with success.

EMERY.—Deer Lodge Independent, Sept. 15th: Mr. Stanchfield 4 miles below Silver Bow, has discovered a strata of very fine emery 18 inches thick, which has proved to be an excellent article for polishing glass, cutlery, silverware and jewelry.

MEADOKER CO.—Helena Gazette, Sept. 18th: Nothing has been done in Trout Creek since the cave in the drift of the Co. Little work is being done in New York gulch, although some claims are doing well in the upper dist. In Oregon gulch several claims are turning out good pay. In Cave gulch but few miners are at work except on the foot hills near the mouth. Hornbuckle and Marshall are among the most successful miners on the bar. Stafford & Co. have made some good runs.

## New Mexico.

BULLION.—Las Cruces Borderer, Sept. 7th: 490 oz. of silver were brought down on Monday from Silver City. On the same day T. J. Bull shipped east \$1,325 in gold from Pinos Altos.

## Utah.

BULLION.—S. L. Tribune Sept. 22d: W. F. & Co. received and forwarded, during last week, from Pioche and East Cañon (mainly from the former), \$100,000 worth of fine bullion; on the 18th, they received 2 bars, worth \$2,493 from East Cañon and 1 bar from an anarasta known as the Ophir mill, worth \$367.33; on the 20th W. F. & Co. shipped to N. Y. 5 bars of fine bullion from the Meadow Valley Works at Pioche worth \$7,217.97, and received one bar from the Pioneer mills at East Cañon worth \$1,157.97. From Sept. 1st to the 19th, the amount of bullion and ore shipped from this City foots up as follows: East, 160,000 lbs of ore; 380,000 lbs of bullion. West, 560,000 lbs of ore; 80,000 lbs of bullion.

SALES.—Col. Taylor & Son recently purchased an interest in the Chadbourne and Buckeye mine for \$7,000. They have purchased in addition 400 ft. in each of the

above lodes, 400 ft. in the Christopher Columbus, for \$10,000. They have sold property in the Bingham for \$25,000.

OPHIR DIST.—The Brevoort mill in East Cañon is a perfect success. Two or three different kinds of ore have been tried and all been successfully worked. That of the Velocipodo, considered very refractory, has been treated without difficulty. A portion of the original interest has been sold to two young men from the Eastern States, who bring \$30,000 to complete the enterprise.

The Pioneer mill is running regularly on Tiger ore; and there is sufficient ore in that camp to run 3 mills the year round.

The Webster shaft, down on the Mountain Lion 60 ft., displays a handsome vein of chloride ore 5 ft. in width.

The Virginia, worked by a tunnel, is taking out 5 tons of ore daily worth from \$100 to \$300 per ton. The Co. has 10 tons from this mine worth \$1,000 per ton.

The Lizzie, 40 feet down, has a vein of ore matter 8 ft. thick; assays made average \$139 per ton.

The Occidental sunk 60 ft., shows a lode 5 ft. in a breast, which has been drifted on 100 ft. The ore is a rich chloride.

The Tampico, Silveropolis, Grand Turk and Norman are looking well. The Norman is owned by T. W. Cooke. He has reached a depth of 50 ft., and has ore that is worth on an average about \$200 per ton.

LITTLE COTTONWOOD.—The tramway of the Flagstaff is in running condition and is 300 yards long.

Two good prospects have been discovered within the last few days near Alta City. One of these is known as the Yreka, and the other as the Henry Clay.

C. Brewer has made a discovery near the Chicago Hill in East Tintic. A nice vein of ore has been struck which it is thought will hold out.

Another party has made a similar discovery in the same part of the dist. out of which they have taken a block of galena weighing 300 lbs.

The shafts on the Sunbeam are being successfully worked. The mines on Eureka Hill, owing to lawsuits, are mostly at a stand-still.

The furnace at Homanville is running regularly. Another furnace is going up at Diamond.

OPHIR.—Cor. same: A blast in the Irene, to-day, uncovered a deposit of fine ore of the milling class, and good judges say much of it is \$200 ore.

KELTON.—Cor. Corinne Reporter, Sept. 18th: The Black Pine mines, are attracting considerable attention, owing to a sale made last week by Doc. Rice and Nichols, to Mr. Johnson and associates, for \$50,000—\$12,500 being paid down.

LAKE SIDE DIST.—S. L. Review, Sept. 21st: Mr. Sevier, after going down 22 ft, has struck 4 ft. of good ore.

PARLEY'S PARK.—The Walker & Webster mine is ready to ship ore. The Flagstaff is prospecting finely, having a large body of ore in sight in the shaft. The Norfolk at 30 ft., has a ledge 5 ft. wide; tunnel East 15 ft., have struck another ledge of superior quality of ore.

LION HILL.—The South side is attracting considerable attention. Several locations have been made by an English Co. Two of them show very well. One, the "Bateson Lode," opens with a black spar similar in appearance to the rich Arizona ores.

A tunnel is in contemplation to tap Lion Hill from the east side, running for the main body of ore struck at the surface.

STOCKTON ITEMS.—Metropolitan.—Working 3 shifts; 15 men taking out a large quantity of good ore.

ST. PATRICK.—8 men at work, have plenty of ore in sight, but are now drifting to facilitate future working.

GRAND CROSS.—Working 8 men.

BOLIVIA.—Promises to be one of the leading mines of the dist., as the ore now being hoisted is good.

PAUL PRY.—Running a tunnel for air to their shaft and to facilitate working; they have excellent ore and plenty of it.

TUCSON.—Not working, but has a fine vein of rich galena ore.

FIRST NATIONAL.—Working 6 men on a good vein of ore.

PUTNAM.—Working 10 men. Have good ore but are now developing.

OUR POPULATION.—Forty millions has been the figure generally set down as the population of the United States in 1870. The census figures report 38,500,000. We may fairly charge the war of the rebellion with the missing two and a half million, in the depreciation which it produced in the arrival of emigrants, deaths caused by violence, and disease contracted in the armies, and in the lessened rate of births.

## Mining Stock Market.

THURSDAY EVE., Sept. 28, 1871.

The meeting of the Ophir Copper, Silver, and Gold Mining Co. announced under the appropriate head below, is for the purpose of taking into consideration an increase of the capital stock from \$375,000 to \$1,000,000. The last weekly report of the Chollar-Potosi shows 420 tons of ore extracted, assaying \$43.11 per ton. The officers elected at the meeting of the Gen'l. Lee Mining Co. were: President, Ira G. Hoyt; Secretary, C. F. Schultze, and Trustees Messrs. Hoyt, Schultze, Patridge, Rushman, and Cline. The North Star Co. elected as Trustees, Messrs. Harmon, Bell, Browne, Gashwiler, and Paul. On September account \$77,700 have been received from the Meadow Valley mine; this and the Raymond & Ely are reported to be in excellent condition. At a meeting of the Trustees of the North Star mine, A. P. Harmon was re-elected (President); W. C. Ralston, (Treasurer); and D. Jennings, Secretary. The Meadow Valley Extension Company have elected the following Trustees: L. A. Booth, (President); C. T. Hamilton, N. C. Paddock; M. F. Game, (Secretary); and W. H. Clark, (Superintendent.) The Trustees of the Magnolia, appointed at last meeting, are Messrs. Teese, Copp, Mesagaces, Falk, and Rosener. For the week ending September 23d there were extracted from the Savage mine 755 tons of ore; average assay value \$28.30. Raymond & Ely still continues a favorite. On September account \$11,700 have been received from the Caledonia mine and \$85,000 from the Meadow Valley. Trustees of the Imperial Consolidated Co., elected to-day, are: Messrs. Harmon, Sharron, Fry, Weller, and Dobinson. September receipts of the Raymond & Ely mine aggregate \$148,257 equal to \$6,177 per day; the last weekly run showing the highest yet, an average of \$7,140 per day. Overman continues to be the feature in the Stock Board, and there is also a marked improvement in Belcher and Segregated Belcher.

## Leather Market Report.

[Corrected weekly by Dolliver & Bro., No. 109 Post et.]

SAN FRANCISCO, Thursday, September 28.

SOLD LEATHER.—Eastern shipments still keep the market firm and the demand good.

City Tanned Leather, #1 B. 26c/29  
 Santa Cruz Leather, #1 B. 26c/29  
 Country Leather, #1 B. 26c/29  
 French stocks continue in great freedom and prices are easier in leading skins. The cheaper grades still continue firm. California kip and calf skins are still scarce and high.

Jodot, 8 Kil, per doz. \$30 00  
 Jodot, 11 to 12 Kil, per doz. 30 00  
 Jodot, second choice, 11 to 15 Kil, per doz. 30 00  
 Lemoine, 16 to 19 Kil, per doz. 30 00  
 Levin, 12 and 13 Kil, per doz. 30 00  
 Cornellian, 12 to 14 Kil, per doz. 30 00  
 Ogerau Calif, #1 doz. 30 00  
 Mercier Calif, 16 Kil, per doz. 30 00  
 Robert Calif, 7 and 8 Kil, per doz. 30 00  
 Common French Calf Skins, #1 doz. 30 00  
 French Kips, #1 B. 1 00  
 California Kip, #1 doz. 65 00 to 80 00  
 Eastern Wheel Stuffed Calf, #1 B. 1 10  
 Eastern Bench Stuffed Calf, #1 B. 1 10  
 Sheep Roane for Lining, #1 doz. 5 50 to 10 50  
 Sheep Roane for Lining, #1 doz. 5 50 to 10 50  
 Good French Calf Boot Legs, #1 pair. 4 50 to 5 00  
 French Calf Boot Legs, #1 pair. 4 50 to 5 00  
 Harness Leather, #1 B. 45 00 to 50 00  
 Fair Bridle Leather, #1 B. 45 00 to 50 00  
 Skirting Leather, #1 B. 34 00 to 37 00  
 Welt Leather, #1 doz. 30 00 to 50 00  
 H. L. Leather, #1 foot. 17 00 to 21 00  
 W. Side Leather, #1 foot. 18 00 to 22 00

SORE THROAT, COUGH, COLD, AND SIMILAR TROUBLES, if suffered to progress, result in serious pulmonary affections, oftentimes incurable. "Brown's Bronchial Troches" reach directly the seat of the disease, and give almost instant relief. They have been thoroughly tested, and maintain the good reputation they have justly acquired. As there are imitations, be sure to obtain the genuine.

Opera Glasses, Pebble Spectacles, and Eyeglasses, in great variety, wholesale and retail. O. MULLER, Optician, 205 Montgomery street, Russ Block, San Francisco, 7c23-3m

## Liverpool Copper Report.

We learn from the monthly copper report of Messrs. Lewis & Son, dated Sept. 1st, that the sales for the previous month were very quiet. The sales for August amounted to 1,400 tons, at from £66 10s., to £68 15s. per ton on arrival, according to brand. Quotations up to date were: Ore and Regulus, 13s. 9d. to 14s. per unit; Bars (Lots), £66 15s. to £67; Urments, £67 5s. to £67 10s.; other brands, £68 to £68 10s.; Chile Ingots, £74 to £75 per ton. Stocks of West Coast Produce equalled 17,822 tons fine, against 18,250 tons on 1st of August, and against 19,564 tons fine, Sept. 1, 1870, when quotations were—Bars, £64; Ore, 12s. 9d.; against 13,240 tons fine, Sept. 1, 1869, when quotations were—Bars, £68 10s.; Ore, 13s. 6d.; against 8,400 tons fine, Sept. 1, 1868, when quotations were—Bars, £67 10f.; Ore, 13s. 9d.; against 8,964 tons fine, Sept. 1, 1867, when quotations were—Bars, £73; Ore, 14s. 9d.

## Mining Shareholders' Directory—Meetings, Assessments and Dividends.

(Compiled weekly from advertisements in the Scientific Press and other San Francisco journals.)

\*Advised in this journal.

The San Francisco Scientific Press of July 29th has a well written communication from Mr. Murray, its agent, giving a truthful description of Gold and its uses. In connection with it is a sectional cut of our coal beds, which is an important accompaniment. The Press is an excellent paper, and is doing much in the dissemination of knowledge of our growing west.—Transcript, Golden, Cal.

TO THE MINING INTEREST.—Believing that they can thereby aid the mining interest, the managers of the Eighth Industrial Exhibition of the Mechanic's Institute request contributions of ores, minerals and metals from the mines, mills and furnaces of the coast. Such contributions will be given a prominent place, and will be labelled with details furnished of the condition, etc., of the works from which they come. The collection, if a full one, will attract attention and CAPITAL TO OUR MINES. Wells, Fargo & Co., will forward, free of charge, all such packages, to be sent before August 5th, addressed to Mechanics' Institute, care J. H. GILMORE, San Francisco.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have endeavored to obtain reputation for their prepared Cocoa, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopathic and invalid use we could not recommend a more agreeable and valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers, Original Homeopathic Cocoa and Soluble Chocolate Steam Mills—Brick Lane, London. Export Chicago Mills, Chicago, Belgium. 7c23-3m

N. Selbert's Eureka Lubricators for steam cylinders are acknowledged by all engineers to be superior to all others they ever used. The oil is regulated by pressure of water in the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not rust or gum, and will pay for themselves in a short time in the saving of oil over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First street, San Francisco. 8v23-3m

## A FEW WORDS TO SPORTSMEN.

As the shooting season begins we wish to enter an earnest protest, not so much against sporting, as a cruel and barbarous pastime, but against the careless use of good arms, and all use of poor ones. Every year the papers have to chronicle a large number of accidents resulting from the use of fire-arms. Several have already occurred the present season. Some of these accidents result fatally, while others only maim or disfigure their victims to a greater or less degree. While many of them could not well be foreseen or avoided, the vast majority are caused by gross carelessness. That this is true we think no one will deny who has made a study of the matter.

Well! how would you help the matter? some one asks.

In the first place, be sure that you have a reliable weapon. One that has been well tested in its making, and which will bear heavy charges and rapid firing. Unless you are in the habit of handling guns, and a good judge of the article, get some one who is posted in such matters to go with you, or at least to send you to some responsible dealer.

It is well to concede at the start that a good gun must cost a good fair price. No matter how free from useless carving, engraving and varnish, the making of a good stock, lock, and barrel requires good stuff and much hard work, all of which must be paid for. Without entering into a discussion of the comparative merits of long barrels or short ones, muzzle-loaders or breech-loaders, bar or back-action locks, we insist that your gun should be selected by a competent person, and the price should be high enough to pay for good work. No doubt many cheap guns will throw shot as well as those that cost ten times as much, but those who use them run a terrible risk. At one time it is some promising boy who is killed outright, at another time the principal of a large school loses a precious hand by the bursting of one of these infernal machines.

It has been held by some that dealers in this miserable trash should be held responsible for all casualties resulting from their defects. This may appear to be a severe doctrine; but it is hard to see why men should be put under restraint in dealing in gunpowder, kerosene and chemicals, and yet be allowed to sell guns which are as dangerous as any of the above articles.

Let it not be inferred from what we have said against cheap guns, that high priced ones are of necessity good. On the contrary, many of the poorest shams are set off with much carving, varnish and fancy case, and sold for enough money to buy a good gun. The only way in which you can be reasonably sure of buying a safe new gun is to deal with a reliable gunsmith who knows what he is selling, and has a reputation to lose.

Don't have too great faith in the old English gun, which was brought over by your ancestors. Very likely if you have the breech-pins taken out, the chambers will be found worn quite too thin for safety. It is well known also that metal which is frequently jarred or strained, as a gun is when fired, finally loses much of its strength, by the re-arrangement of its atoms which gradually takes place.

If the following simple rules were generally observed, at least nine-tenths of the accidents arising from the use of fire-arms would be rendered impossible:—

*First.*—Never point a gun or pistol toward yourself, or anybody else whom you do not intend to shoot. No matter how sure you are that the weapon is not charged, observe this rule for the sake of good habits. Not only should you refrain from levelling a weapon at a person intentionally, but it is just as important that you make sure at all times, that, in case of an accidental discharge, the shot will do no damage.

*Second.*—When loaded and capped always carry your gun at half-cock. It is a

very common custom to carry the gun with the hammers resting on the caps; but it is by far the most dangerous method that could be selected, as there are three ways in which the gun may then be accidentally discharged. If the lock is a strong one, the simple pressure of the hammer will often be as efficient as a quick blow in exploding the cap. Any hard blow upon the back of the hammer will certainly discharge the gun. And lastly, if the hammer is caught by a twig, or in passing a fence, and raised a short distance and then released the cap must be fired, while if at half-cock, the hammer when released would be caught on the half-cock notch, or at worst be brought to full-cock. A gun that can be fired from half-cock, without breaking the lock, is so dangerous that no sensible person will use it a day, if there is a mechanic within reach who can repair it.

*Third.*—When getting into a carriage with a loaded gun, take the caps off. When you expect to shoot from the vehicle, this danger of carrying a gun capped, may be much reduced by putting an elastic wad, like Ely's, between the hammer and the cap.

*Fourth.*—Never leave a loaded gun in a house without its being capped, or in some way marked as loaded. We often see accounts of persons who have taken up such guns supposing them to be empty, put caps on them and snapped them at some friend whom they wished to frighten. The result of such sport is too frequently

aggressive farmer of Napa, Cal., who entered this general favorite at the State Fair last week.

Our drawing is reduced from an oil painting, by D. H. Woods of Sacramento. We hope to follow this publication with portraits of other celebrated animals on this coast, thus giving the first series of finely engraved and printed illustrations of home stock in the Pacific States.

## Books for the People.

## Questions of the Day.

Henry Carey Baird, the Industrial Publisher, of Philadelphia, is one of the staunchest advocates of protection to home labor, and to him is due the issue of a great number of works on practical and scientific technical knowledge. The range of these publications includes almost every branch of manufacture, and they are such as every intelligent employer requires in daily use. The best works written abroad are translated and their contents made available to benefit American industry. His last publication is a treatise on the "Questions of the Day," written by Dr. Wm. Elder, well known in the East, as a most profound thinker. It is the result

THE CELEBRATED CALIFORNIA HORSE "LODI."

a coroner's inquest, and a verdict of "accidentally shot."

We could give instances of fatal results from the neglect of each of these rules, and we fear that any one of the readers of this article could soon make a large collection of items on the subject.

Most fathers are too careless about the quality of arms which their boys carry, and the instruction which they have as to the proper mode of handling them. Everybody beginning to shoot should have the above rules impressed upon his mind, and the perusal of some good "Sportsman's Manual" will be repaid in added safety, efficiency and enjoyment.

## The Celebrated Horse "Lodi."

We present a finely drawn and executed engraving of this celebrated racing horse, whose best time we believe has been beaten only by his competitor, Norfolk, and then by less than a full length. We allude to the three-mile heat at the State Fair, in Sacramento, September 23d, 1865, which was made in 5:27 1/4; and the last mile in 1:47 1/4. He carried at that time a 110 lb. rider. At that trial, Lodi suffered from a quarter crack in one of his fore hoofs, from which the blood spirted freely. His color is dark brown, and, as truthfully shown (by our own engraver) he is of beautiful figure. Having spent the best of his eleven years in this State, he is too well known to Californians to need any lengthy description in this connection.

Lodi's pedigree is by Yorkshire out of Topaz by Glencoe. He is now owned by Mr. Nathan Coombs, a wealthy and pro-

of about 20 years' study and preparation. The main subjects of the work are: Political economy; formation of society; civilization; wealth—the laws and conditions of its growth; sources of advancement; law of increase in population; distribution of wealth—wages, and money as an exchange of value. It also treats of paper money; commerce; trade between nations; free trade and protection; doctrine and policy of protection with the most prominent and plausible objections to the system; guarantism; and secret societies. The chapters in coöperation will be read with special interest, as they give a complete survey of the field of coöperation in connection with stores, manufactories, banks, etc., and a general view of the system in the United States. The book is neatly printed on excellent paper, and is well worth a perusal by all classes of society. For sale by A. Roman & Co., 417 and 419 Montgomery street.

## Alcoholic Liquors.

This is the title of a volume on the manufacture and distillation of alcoholic liquors, comprising accurate and complete details in regard to alcohol from wine, molasses, heats, grain, rice, potatoes, fruits, etc.; with the distillation and rectification of brandy, whisky, rum, gin and absinthe. It also treats of the preparation of aromatic waters, volatile oils or essences, sugars, syrups, aromatic tinctures, liquors, cordial wines, effervescing wines; the ageing of brandy and the improvement of spirits with directions and tables for testing and reducing spirituous liquors, etc. It con-

tains also the United States revenue regulations for the assessment and collection of taxes on distilled spirits.

The work is translated from the French of Duplais, by M. McKennie, M. D., and is published by Henry Carey Baird. As the manufacture of alcoholic liquors is now attracting considerable attention in this country, this exhaustive treatise on the subject will be found convenient to those directly interested, as well as to the general reader. This work is illustrated, and may be procured postage free for \$10, by addressing Henry Carey Baird, 406 Walnut St., Philadelphia.

## Every Horse Owner's Encyclopedia.

This book is illustrated with nearly 100 fine engravings and treats of the anatomy and physiology of the horse; general characteristics, points, and directions how to choose one. Principles of breeding and the best kind to breed from; treatment of the brood mare and foal; training and breaking the colt; stables, stable management, riding, driving, etc. Horse diseases and the way to cure them is specially noticed. The American trotting horse is also treated of with suggestions on the breeding and training of trotters. There is also a list of stallions imported into America from the earliest dates and tables of pedigrees of celebrated trotters. The Percheron horses of which so much has been said in the PACIFIC RURAL PRESS, receives considerable attention. The engravings are well executed, and the frontispiece representing the race between "Goldsmith Maid" and "American Girl" in 1868, is cut on steel. The volume contains 582 pages, is handsomely bound, and is, as its title promises, a complete horse-owner's encyclopedia. It is for sale, by subscription only, at Roman & Co.

## Creighton's Pruning Shears.

We present to our readers to day, an engraving of a most useful little tool, for cutting off the stems of flowers or fruits, and at the same time grasping them to keep them

from falling. This will be especially useful in gathering grapes. The invention of agricultural implements in the United States is a source of wonder among people in Europe, from their variety and number, and the ingenuity displayed. Farmers now-a-days do their work with one-half the actual labor with which it was performed 50 years ago, from the facilities afforded them by the use of the numerous improved agricultural implements. Tools like the one shown in the cut become much more general in use than those of even greater importance, because they are usually within reach of all on account of their cheapness.

These pruning shears are merely an ordinary pair of shears, with the little apparatus for seizing the stems, fastened to the sides. The tool is made of two pieces of metal covering each other in the same manner as scissor blades, and the same bolt serves to fasten both the pinching apparatus and the blades. The handles are secured by means of screws to those of the shears, so that they operate simultaneously, cutting and grasping at the same time. The gripping strength can be regulated by the length of the arms. The gripping tool can be readily removed and attached when desired, and being for the most part independent of the shears, is not liable to be broken.

By means of this little tool the planter may go among the vines, and cut and grasp the bunches of grapes at once, using only one hand while the other is free. Its use will be readily appreciated by those who pick fruit for the market, or for the purpose of manufacture.

This useful implement is the invention of J. F. Creighton, Placerville, El Dorado county, and has been patented through the agency connected with this office.

## USEFUL INFORMATION.

## What Guides the Birds.

Swallows, and probably other migratory birds, return, as is well known, not merely vaguely to the North, but to the very caves they quitted on the previous year.

We might possibly explain the marvels of dog and cat journeys, by supposing the sense of smell in such animals to be (as it undoubtedly is) as powerful a guide as that of sight is to us; so that, as we find our way by remembering the appearance of walls, trees and brooks, a hound may find it by recalling the various odors of fields, and woods, and farmyards. But even if we could possibly so explain the recognition of places by a cat which has traversed them shut up in a railway van, it is clear that the theory cannot apply to those birds which, like the wild geese, soar up to the greatest distance from the smells of earth as the preliminary of their aerial voyage.

Is it, then, within the scope of credibility that to all the creatures who need such a faculty, Providence has accorded some other power altogether, some sixth sense, of which it is as hard for us to judge, as for a blind man to understand sight? Can it be that the magnetic currents to which our farmers are insensible, may, for the brutes, be as much a matter of clear perception as the direction of the wind is to us as we walk in a breeze, and that, consequently, wherever they go they have an internal compass which never deceives them, or leaves them in doubt as to whether they are going in the direction of the current or across it? I throw out this suggestion with great hesitation as the result of very long consideration of the riddle.

## Microscopic Examinations.

The air of printing offices contains particles of metal, particularly antimony. Dust taken from a rafter eleven feet above the floor of a printing office, was analyzed by Professor Sullivan, and found to contain antimony but not lead.

The air of a hair-dressing room contained scales, and minute hairs. In rooms where the machine brush is used the amount is increased.

The air of a dissecting room contained fragments and fibres, with the mark of the dissecting knife upon them. They were fibrils of muscles, yellow and white fibrous tissue, some cells, scales, and corpuscles. The air of stables was found to contain moth scales, a few pores, hair and fragments tinged blood color.

Tobacco smoke, examined by the microscope, was seen to hold little globules of nicotine twirling and flitting about in it. The statement is made that some remained on the walls of the month; when the smoke is breathed (by novices) more globules are retained in the lungs, and nausea supervenes. The globules, if found in the air distributed by a tobacco smoker, might be taken for germs.

**HOW A MAN FEELS WHEN HIT BY LIGHTNING.**—During a recent thunderstorm in Ohio, Mr. Sanford Ticknor and his hired man were crossing a field when they were struck down by a bolt of lightning from the clouds. The hired man was made insensible for twenty-four hours, when he became conscious. His only remembrance of the shock was that "suddenly the ground raised up and buried him"—at least so it seemed, but no trace of any disturbance of the earth could be found, nor any mark upon the man. Mr. Ticknor was not so badly stunned; indeed was not made unconscious at all. He describes his feelings as though he had been hit by a severe blow with a stone on the head and one foot, accompanied by the feeling that a shower of gravel had been thrown on him. He remembers a blinding flash of light succeeded by smoke. Both have recovered.

**TO REMOVE FOUL AIR FROM WELLS OR MINING SHAFTS.**—It is well known that many accidents occur to persons going down into wells and old mining shafts to clean them, owing to the noxious gas in such places. To remove the gas before descent is made into any well, a quantity of hurned but unslacked lime should be thrown down. This, when it comes in contact with whatever water is below, sets free a great quantity of heat in the water and lime, which rushes upward carrying all the deleterious gas with it; after which, the descent may be made with safety. The lime also absorbs carbonic acid in the well. Always lower a light before descending; if it is extinguished, there is still danger of suffocation.

## How To See Under Water.

The Indians of North America do this by cutting a hole through the ice, and then covering or hanging a blanket, in such a manner as to darken or exclude the direct rays of the sun, when they are enabled to see into the water, and discover fish at any reasonable depth. Let any one who is anxious to prove this, place himself under the blankets, and he will be astonished when he beholds with what a brilliancy everything in the fluid world is lighted up. I once had occasion to examine the bottom of a mill pond, for which I constructed a float out of inch plank, sufficient to buoy me up; through the centre of this float I cut a hole, and placed a blanket over it, when I was enabled to clearly discover lost objects on the bottom, and several lost tools were discovered and picked up. I am satisfied that, where water is sufficiently clear, this latter plan could be successfully used for searching for lost bodies and articles. I would now suggest that this experiment be tried on the sea; for I am satisfied that, with a craft like the Great Eastern, where an observatory could be placed at the bottom; with sufficient darkness, by the aid of glasses we could gaze down into the depths of the sea same as we can survey the starry heavens at midnight.—*Scientific American.*

**RAILROAD SIGNALS.**—It may be interesting to many of our readers to understand what the different whistles of a locomotive and the various motions of conductors mean. Here it is: One whistle means "down brakes;" two whistles, "off brakes;" three whistles, "danger." A rapid succession of short whistles is the cattle alarm, at which the brakes will always be put down. When a conductor gives a signal by a sweeping paring of the hands, on a level with his eyes, it means, "go ahead." A downward motion of the hand, with extended arms, "stop." A beckoning motion of the hand, "to back." A lantern raised and lowered vertically, is a signal for "starting;" swung at right angles or crossways the track, "to stop;" swung in a circle, "to back the train." A red flag, waved upon the track, is a signal of danger; so of other signals given with energy. A red flag hoisted at a station, is a signal for a train "to stop;" stuck up by the roadside, it is a signal of danger on the train ahead; carried unfurled upon an engine, a warning that another engine or train is on its way.

**MAKING CANDLES.**—Many of our farmers who study economy in their domestic affairs, find it more economical to make their own candles than to buy them. Such persons will find that by making the wicks about half the ordinary size, and dipping them in spirits of turpentine, and drying them carefully before the fire, or in the sunshine, before moulding, they will last longer and afford a much clearer and more brilliant light than those made in the ordinary way. A small portion of beeswax, melted with the tallow, has a tendency to prevent their "running," and renders them much more lasting.

**FISH HAVE GREAT TENACITY OF LIFE.** It is believed that the carp has attained the age of one hundred and fifty years, and the pike a still greater age. A pike was caught in a lake in South Germany in 1497, on which was found a ring bearing this inscription, "I am the fish which was first of all put into this lake by the hands of the Governor of the Universe, Frederick II., the 5th of October, 1280." It weighed three hundred and fifty pounds, and was nineteen feet long.

**TO WASH HAIR BRUSHES.**—Hair brushes, however dirty, may be washed and kept good for years, without loss of stiffness, by putting a small handful of soda into a pint jug of boiling water. When the soda is melted, put in the brush and stir it about till clean. Rinse it in cold water, and dry in the sun or by the fire. The quicker it dries, the harder the bristles will be.

**ACHING CORNS.**—Why do our corns ache just previous to rains? Because our feet swell with the sudden depression in the density of the air; and the hard corn, not being elastic, is painfully stretched and pressed.

**A HOT PLACE.**—The temperature of the sun has been determined by Capt. John Ericsson, by means of his solar pyrometer, to be not less than 4,000,000 degrees Fahrenheit.

A cord of wood furnishes sufficient material for the manufacture of 800 pounds of paper. A ton of straw, 750 pounds.

## GOOD HEALTH.

## Have We a Healthy Man Among Us.

It is the custom new-a-days, in speaking of the physical condition of the American people, to assume that whatever characteristics belong to it are to be traced back to woman, and as even the casual observer perceives that we as a people, are subject to various weaknesses or disorders, the consequence is that the delicate shoulders of women are weighed down with a heavy bundle of complaints and advice. Against this we protest. It is not courteous, to say the least, and besides, the assumption is unsupported. When it comes to a matter of health, the question is not one of sex, but of race; and although it is undoubtedly true that no people can long maintain themselves without healthy fathers.

Have we a healthy man among us? Yes, as individuals, but he is not what is called in current talk, "the average man." This is the land of patent medicines, and the supply is according to the demand.

There are two specific causes for the ill-health of men. In the first place, every man is trying to get on in life. We begin when we are boys. No one is born to a place in society. Every one is told, and feels, that he must make for himself a place. And also, that he may step higher up, he is continually aiming at a star rather than a tree, or often exhausts himself in seeking that which is still beyond him.

In the second place, the pleasures of men often injure them. The young man at college rows himself out of health, while the man of business mistakes excitement for pleasure. There must be something pungent and almost acrid about even the occupations of a day of leisure. There is no time in these days for one to sit in the sun and sing old songs.

Something more is charged upon woman. In her devotion to fashion it is said that she renders herself unfit to become a mother. But how is it with men? Has not indulgence as often ruined the father as fashion the mother?

## Diseases Incident to the Season.

The seasons of spring, summer and autumn very commonly give rise to certain atmospheric influences which tend to the development of malarial diseases. In low and marshy places it generally crops out in the form of chill fever, bilious fever, etc.; and in the more southern portions, congestive and yellow fever; while in more healthy localities, dysentery, pleurisy, acute inflammations, and attacks of indigestion—such as diarrhoea, cholera morbus, etc., will occur.

Where the eliminating organs are active, but the powers of the system only adequate to partially resist this atmospheric poison, it will manifest itself in chronic congestion of the liver, irritation of the bladder, constipation of the bowels, general debility, and neuralgia.

To obviate these effects, the body should be well protected with clothing; great mental or physical fatigue obviated; all excesses avoided; houses should be well ventilated, and fires in the lower portion of the house at least every evening. The sleeping apartments should be up-stairs and dry. In the treatment, active purgatives and all debilitating remedies should be avoided.

**DEATHS FROM DRINK.**—Doctor Edward Jarvis, statistician of the General Life Insurance Company of London, furnishes the following statement, as showing the death of persons who are intemperate as compared with an equal number of persons of temperate habits. He says that if 100,000 intemperate persons be taken from fifteen to seventy years of age, and an equal number of corresponding ages, who are not intemperate, 32 of the former will die as often as ten of the latter. Out of 100,000 of each, 15,907 of the intemperate will be dead before fifty years of age, but of those not intemperate, 4,266 only will be dead. From fifty to sixty years, the comparative number of deaths will be 6,419 and 2,254, and from sixty years to seventy they will be 55,175 and 33,280. Here is an argument *ad rem* which should be much more potent than any prohibitory laws to check the suicidal growth of habits whose fatal results are thus mathematically demonstrated.

Persons of a nervous temperament performing brains work should subsist mainly upon fish and cornmeal.

A TAPE WORM, fifty-two feet long, has been removed from the stomach of a man in Houston County, Texas.

## Glycerine as Food and Medicine.

Glycerine is one of the most valuable articles our pharmacopoeia can boast, while as an article of food, it is one of the best and most fattening nutriment. Sweet oil, or olive oil, has for ages been an article of daily diet in Palestine and other old countries, and glycerine is an essence of it. It is a perfectly natural and bland fluid, and the most penetrating, perhaps, in all nature. Oil itself will penetrate where water will not, and glycerine, which may be considered the ethereal part of oil has this property to a most remarkable degree—it penetrates the solid bone.

A medical journal tells us that if poured into a mixture of blood and matter, such as is expectorated from consumptive lungs, it will get between the globules of each and show them with greater distinctness. Being thus penetrating, it is the very best application for feverish sores, for inflamed or dry surfaces, simply from its quality of penetration and evaporability. If applied with a common brush to the surface of the throat in diphtheria, in a few minutes its permeative quality enables it to sink between the molecules of the false membrane, dissolving and detaching it in a few hours. It is the best application known in case of burns.

## Cure For Lead Poisoning.

The last published volume of Chambers' Encyclopedia recommends the following treatment as a sure and speedy cure for lead poisoning. The patient should be placed in a sulphuretted bath, which converts all the lead salts in the skin into the inert black sulphide of lead. These baths should be repeated till they cease to cause any coloration of the skin. At the same time he should drink water acidulated with sulphuric acid or a solution of sulphate of magnesia, with a slight excess of sulphuric acid, by which means an indissoluble sulphate of lead is formed, which is eliminated by the purgative action of the excess of sulphate of magnesia. Iodide of potassium is then administered, which acts by dissolving the lead out of the tissues, and allowing it to be removed by the urine. The palsy may be specially treated, after the elimination of the lead, by electricity, and by strychnine in minute doses. Persons exposed from their occupation to the risks of lead poisoning should be especially attentive to cleanliness, and if they combine the frequent application of the use of sulphuric lemonade, or treacle beer acidulated with sulphuric acid, as a drink, they may escape the effects of a metallic poison.

**TREATMENT FOR FAINTING AND LOSS OF CONSCIOUSNESS.**—Where the mind becomes intensely excited, it is liable to disturb the circulation to such an extent, as to result in loss of consciousness. It is best treated by placing the patient at once on the back with the head slightly elevated and the arms extended; water should be dashed in the face, and the palms of the hands and soles of the feet slapped or rubbed briskly. No more persons should be allowed to gather around than is absolutely necessary for the case; if immediate consciousness is not restored, ice should be applied to the spine, or, in the absence of ice, cold water should be dashed along the spine. Spirits of ammonia may be applied to the nostrils, and brandy or whisky injected into the bowels in extreme cases.

**INTENSE craving for food of improper kinds and at unreasonable hours, can be prevented to a great extent by drinking water.**

THREE persons in one family, the father and a son and daughter, died recently from eating pork containing "trichina," near Casey, Adair Co., Iowa.

CHILDREN of a weak and scrofulous habit should be allowed all the white sugar they desire. It improves digestion and strengthens the blood.

**INSANITY.**—Statistics prove that about one-half the cases of insanity have been occasioned either directly or indirectly by strong drink.

FUEL for domestic purposes became so rare an article during the siege of Paris, that several ingenious devices were invented to meet the positive hardship suffered from its scarcity. One process that met with great favor was to saturate porous cylinders of clay prepared for the purpose with bituminous substances. These were used like the charcoal, which is largely used under ordinary circumstances.

## Removal.

The entire business office of the SCIENTIFIC PRESS, PACIFIC RURAL PRESS, and our U. S. and Foreign PATENT AGENCY and ENGRAVING establishment, will be removed Oct. 1st to No. 338 Montgomery st., on the southeast corner of California street, diagonally opposite Wells, Fargo & Co.'s.

**NEW MINES IN ARIZONA.**—A party of ten prospectors have lately returned from Arizona, reporting the discovery of rich gold quartz and auriferous diggings among the valleys and in the White mountains. They prospected a section of country in this vicinity about ten miles wide and thirty long, and report plenty of water, and good diggings; but say they were driven away by the Indians. According to their assertions the country abounds in game, and there is plenty of good agricultural land in the White mountain range. Some of the party remained in Loe Angeles and are determined to return if they can get men enough to go with them to keep off the Indians. These miners are old frontiersmen and believe that the mines are excellent.

**TIN IN AUSTRALIA.**—The Sydney morning *Herald* reports the discovery of a large deposit of tin ore, of extreme richness, in the northern district, near Inverell. A bag of it has been received and melted by a rude process with a yield of 70 per cent. with a slight admixture of silver and a trace of gold.

**NASH, MILLER & Co.,** is now the name of the firm manufacturing Nash & Cutts' well-known patent fanning mill and grain separator in Sacramento.

## Use of Sulphur or Brimstone for Silver Ores in the Stetefeldt Furnace.

[Written expressly for the Press.]

In times when the roasting of silver ores was carried on in Freiberg for barrel-amalgamation, most critical investigations were carried on for several years, for the purpose of determining what amount of sulphur should be present in the ore, in order to form as much sulphuric acid as would be necessary to decompose the required quantity of salt, and to obtain the highest percentage of silver profitably. The amount of sulphur, or rather of iron sulphurets necessary, was finally agreed to be not less than twenty-five per cent., equal to 265 pounds of sulphur to the ton of ore. In case the ore has not enough pyrites to supply the above quantity of sulphur, more of the former had to be added. But since iron pyrites could not be obtained everywhere at a moderate price, experiments were instituted for the purpose of finding a suitable substitute, containing sulphur or sulphuric acid. The most economical substance was found to be green vitrol or sulphate of iron, of which 50 pounds were required to the ton of ore after 41.79 per cent. of water was driven out by previous calcination. These 50 pounds contained 26½ pounds of sulphuric acid.

It was found that the direct application of sulphur or brimstone did not answer in reverberatory roasting furnaces. When mixed with the ore before charging, the sulphur burned off at a temperature, too low to form sulphates, and this is the first and indispensable condition with reverberatory furnaces treating silver ores. This time and fuel consuming condition, does not exist with the Stetefeldt furnace, owing to the peculiar way of bringing the ore particles in contact with heat and gases, as mentioned in my edition on "roasting gold and silver ores" p. 64. It is stated there, that the sulphurous acid, emanating from sulphurets (or any other source) in contact with ore particles and oxygen, becomes sulphuric acid, acting directly on the salt. It is of course not immaterial, whether this sulphurous acid is created in or outside the furnace, for it seems to be more advantageous to produce this gas outside, if introduced into the furnace below the fire-places, it being thus completely utilized in rising up through the descending shower of glowing ore.

What a waste of sulphur occurs in common reverberatory furnaces, can be seen from the high amount of 265 lbs. which was found necessary to perform the chlorination in a ton of ore. It certainly must be admitted, that little attention is paid here as to the amount of sulphur, especially with the Stetefeldt furnace, wherein, under like circumstances, more chlorine is produced than in common furnaces, and the above proportion of sulphur should be looked upon as a local standard for the Freiberg ore principally. In Hungary for instance, black copper (from smelting) containing from \$140 to \$150 per ton is treated with 7 to 9 per cent. of salt where there is no sulphur at all in the mass, and no sulphur-containing substance is added. On the other hand, argentiferous arsenical pyrites, bare of sulphur, cannot be chloridized in roasting without the addition of sulphate of iron. These facts show, that in some instances chlorine can be obtained from salt without the action of sulphuric acid, depending on substances and circumstances not yet sufficiently known, and for this reason the presence of sulphur under ordinary circumstances, must be considered a necessary part of silver ore.

The Stetefeldt furnace admits of the most convenient and most economical application of brimstone. This chemical is by far the cheapest, (about four ounces per pound) containing the highest amount of sulphur, and the perfect consumption of it in the furnace allows the use of a small percentage. It is important with ores that are generally termed "carbonates and chlorides," the latter sometimes containing either only a small percentage of chloride of silver or none at all. Also for Stetefeldtite and similar ore. Ore having no other sulphurets but a small amount of sulphurets of lead (galena,) yields very little sulphur as the greatest part turns into sulphate of lead and remains so.

In using brimstone I found that a certain class of ore, called "chloride ore" could not be chloridized higher than 70 to 72 per cent., but applying one-half of one per cent. of brimstone, brought it up to 85½. Treating ore that contained galena, 7 per cent. of chloride of silver more was obtained with the aid of brimstone.

As to the mode of administering the sul-

phur, it may be that by crushing the ore and brimstone together, it would give the same result as to introduce it below the fire-place, but there are many obstacles in the way, and after all, it seems that the advantage is in favor of the introduction of sulphurous gas below the fire-place. No sulphurous acid reaches the top of the furnaces and an abundant and agreeable smell of chlorine is perceptible, as soon as the sulphur gas enters the furnace. An easy way to supply the brimstone for temporary use is in front of the discharge door, inside the furnace. It can be placed on a fire-brick or stone, hollowed so as to receive one or two pounds of sulphur, but an outside vessel, a 50 lb. black lead crucible, for instance, with a pipe attached, leading the gas of the burning brimstone into the furnace, is preferable.

G. KUSTEL.

## ON THE ASSAY OF GOLD.

BY HENRY G. HANKS.

[Expressly for the Press.—Continued.]

Before attempting to make a gold bullion assay, the following sources of error should be known:—

Those errors which may result from the non-adjustment of the balance and weights.

If the balance is sufficiently delicate, most of the errors may be disregarded if the weights are always placed in the same pan; and all of them by counterpoising. What is meant by this term may be best explained by an example.

Let it be assumed that the weights are in perfect adjustment, that is to say, each must be exactly what it purports to be, the 0.1 must be accurately one-tenth of the unit, etc., throughout the whole set. They must agree properly among themselves.

Suppose you wish to weigh out one gramme of any substance, by counterpoising. Place a gramme weight in the right hand pan of the balance. Place other weights in the opposite pan, until the index settles nearly at zero, then with a small rider slipped along the beam, so regulate the counterpoise that the index points to zero exactly. Then remove the gramme weight and replace with the substance until the index occupies the same central position as at first. The operation may be reversed when you wish to ascertain the unknown weight of any substance. A moment's thought will make the reason of this operation apparent.

Such weighing will do in extreme cases, but no assayer should be without a first-class balance.

Any convenient unit divided into 1,000 parts may be used in the bullion assay. For gold assays the unit is usually ½ gramme so divided, while for silver, being less valuable, one gramme is used. It is not safe to trust the weights of any maker no matter how celebrated he may be, but it is best for the assayer to test their accuracy for himself.

Another source of error is a slight loss gold on the cupel. This error may be corrected by cupelling a proof in the muffle at the same time with the assay. The proof is pure gold and silver as near the composition of the assay as can be made. The loss of the proof is supposed to be equal to that of the assay and is to be added to its weight. The details of conducting this check assay will be given in its proper place.

A third error may result from using an impure acid. A loss of gold may be sustained from its solubility in nitric acid containing chlorine. This error may be avoided by always having a little silver dissolved in the acid. It is too expensive and wholly unnecessary to employ chemically pure acid in the gold assay. Good commercial nitric acid treated in the manner to be described will answer every purpose. Acid of two grades of strength must be prepared from the strong acid, one of 20° Baumé and one of 30°. It is best to dilute all the acid to 30° with distilled water and add a few drops of a solution of nitrate of silver. Let it remain 24 hours to settle and add a few more drops of the silver solution; if no cloudiness appears silver enough has been added. The acid is allowed to stand covered for a week and the clear portion is decanted off from the slight precipitate of chloride of silver—one-third of the acid is then diluted with distilled water to 20°. The process of diluting is easily performed by the aid of a hydrometer. A portion of the acid is poured into a cylinder deep enough to float the hydrometer, which will sink to a

certain point according to the density of the acid. The strength in degrees, can be read on a scale on the inside of the stem of the hydrometer.

Every assayer should possess a hydrometer and cylinder and dilute his acid himself. The acid so prepared should be distinctly labeled and the fact of its containing silver noted. It should be used for no other purpose.

Still another error to be guarded against is the *surcharge*, which is the small amount of silver which always remains in the cornet, no matter how carefully the manipulations may be conducted. There are several tables computed to correct this. The finer the gold the greater will be the surcharge.

The following results were obtained by a series of careful experiments in the Paris mint, by weighing out accurately gold and silver both absolutely pure to represent the fineness written in the first column. The results in the second column show the surcharge when they are greater than the fineness, and the loss on the cupel when they are less:

900 .....	900.25
800 .....	800.5
700 .....	700.
600 .....	600.
500 .....	499.5
400 .....	399.5
300 .....	299.5
200 .....	199.5
100 .....	99.5

Pure gold for proofs may be obtained by dissolving gold in *aqua regia* (one part nitric acid and two of muriatic,) evaporating nearly to dryness in a water bath, dissolving in distilled water and precipitating with solution of proto-sulphate of iron. The black precipitate, which is the gold, is washed, dried and melted. It is best to let the solution stand for a week to allow chloride of silver to fall, before precipitating with the proto-sulphate of iron. After melting the gold, it should be rolled out thin, cleaned from oil, cut into shreds and kept in a clean bottle for use.

A typographical error was made in the last article, in describing the manner of obtaining clippings from the bar, the word grain was printed instead of gramme, which was intended.

The method of conducting the assay is as follows: The assayer seats himself before the balance, having the clippings in a convenient position inside the case. Half a gramme weight is placed in the right hand pan of the balance and portions of the clippings in the other until nearly correct, but the gold should be the heaviest. The largest piece is then removed by the aid of a pair of pliers, and touched against a clean file by which a minute portion is removed. By careful manipulation nearly the exact point will soon be obtained, but with the greatest care; if the balance is delicate, it will be found nearly impossible to adjust the weight so perfectly that the index will not point either one side or the other of the zero. It will be necessary to make a memorandum of the error and mark it with the number of the assay and in weighing the cornet to take the same reading of the index.

The gold is removed from the balance-pan and carefully folded in a piece of lead-foil an inch square. Care must be taken in preparing this lead, that it is as pure as possible. It must contain no trace of gold. Its purity being established, it is easily prepared by rolling out to a uniform thickness and cutting into inch squares. These should always be prepared by the assayer himself, and kept on hand in sufficient quantities. If not convenient to prepare it, it should at least be assayed before use. Two assays must be prepared as described above.

Two small well-made cupels are then to be placed in the muffle, and when hot, a piece of pure lead weighing three grammes is placed in each, it will soon melt and begin to "drive"—that is, begin to be absorbed by the cupel—the assays are then to be added, when perfectly melted the cupels are to be drawn forward to that point in the muffle, which experience has shown to the assayer that cupellation progresses most successfully. When the cupellation is finished and the buttons have assumed a brilliant, yellow, metallic lustre, they are removed, hammered slightly on either edge on a clean anvil and examined carefully with a magnifying glass, to see that all bone ash has been removed.

The two buttons should weigh exactly alike. If this should not be the case, the heaviest one must be examined carefully to see if any particle of bone ash may have been overlooked. If this should fail, there is no resource but to make another assay, which should agree with one of the first. The correct weight of one of the buttons represents the total fineness, or the pure gold and silver in the bar expressed in thousandths.

## THE COMSTOCK LODE.

Perhaps no vein in the world has been written about to so great an extent or excited so general interest in the scientific, as well as the practical world, as the Comstock lode. Yielding immense amounts of bullion (an average of \$11,000,000 per annum for ten years) giving rise to the most gigantic stock speculations; forming a connected group of fissures of a simple general structure but extraordinarily complex in detail, explored to a depth of over 1,200 feet, traced to a length of some four miles and developed to a length of about one-half this last named distance, calling for now processes of treatment for its ores, suffering a waste of its precious contents sufficient to enrich cities, and even the subject of legislative investigation,—it presents to the stock broker, the geologist, the metallurgist, to all who are in any way connected with mining matters, a history of unparalleled interest.

The literature of the Comstock lode, already very voluminous, has been lately enriched through the labors of the U. S. Geological Exploration of the 40th Parallel, which has published one of the five promised volumes, wisely giving out first that on Mining Industry. We referred to this sometime ago, but certain changes in this office have prevented our since recurring to the matter. It is our intention, however, to speak further on the subject, and at the present time we propose condensing from Mr. King's and Mr. Hague's most excellent chapters on the vein whose title heads this article. Mr. King has written at length and boldly on the geology and structure of the lode, and Mr. J. D. Hague contributes most carefully studied articles on the processes of extracting and reducing the ores. Our condensation will treat only of certain points given by the Survey, and here give a brief account of Mr. King's chapters.

## Structure of the Lode.

The lode is bounded by two walls, running north and south, which, inclining together, the western at an angle of 45° to the east, the eastern being steeper, form a V-like section. This wedge is some 20,000 feet long, 200 to 800 feet wide at the surface, and 800 to 1,200 feet deep. Throughout the greater part of the lode, below the junction of the two walls, explorations show no vein; but at the Hale & Norcross and in the Gold Hill group, the contact does not occur, the east wall curving in to parallelism with the west. The great ore channel is along the eastern fissure.

The space between the two walls is occupied principally by a wedge-like mass of propylite (syenite also occurs), penetrated by numberless seams of quartz and clay. Along the west wall, separating the vein from the country rock, occur relics of a dike of andesite,—the starting point of the lode. Grouped in the sheets of quartz occupying the eastern fissure are the silver ore bodies. In the eastern wall are certain general curves to the east, which are connected at the extremities with the west wall, probably the separate outlets of the general solfatara which is supposed to have formed the vein. The Gold Hill group of mines occupies one of these chimneys, the Bullion and part of the Chollar-Potosi another, the Virginia Group a third, and the Consolidated and Ophir a fourth. Of the country north of the Ophir but scanty information has been acquired.

Throughout Gold Hill the vein in depth becomes a simple, single mass of vein material, and there are no grounds for predicting its giving out. In the Virginia section the eastern crevice terminates against the western wall and the vein is wanting for several hundred feet below, at least; only in the central point, occupied by the Savage and Hale & Norcross, there would seem to be a deep-seated chimney. In the northern regions explorations are not far enough down to give data for a well-grounded opinion as to the nature of the fissure in depth; it is considered quite possible, however, that the Ophir Consolidated chamber may terminate downward in a deep chimney.

## How the Lode was Formed.

In the late Tertiary occurred a volcanic outflow of propylite or trachytic greenstone,

which deluged the Virginia Range from summit to base. Subsequently an outflow of andesite gave the starting point of the lode, causing the western inclined fissure, and also the eastern, which is simply a gash from the surface. This period gave birth to the solfatara which decomposed the surrounding rocks and gradually filled the fissures of the lode with their remarkable charges of quartz, in which, while still plastic, most of the minerals were deposited. It is probable, from the disposition of the bonanzas, that the quartz was injected from below through two or three narrow chimneys; and that it was deposited in a uniform mass, the parallel arrangement being given afterwards by the combined chemical and dynamical action to which it was exposed. A second unimportant, and a third, deposition of quartz, occurred, before which last the percolating of waters, attrition and decomposition produced the sheets of clay.

Not 25 per cent. of the actual face of the lode has been occupied by argentiferous bodies, and, indeed, not more than 1-500th of the lode material has been charged with silver to a workable amount. It is interesting to observe that all the traceable lines of motion, either in the fluting of the east wall or the striation upon clay surfaces, or the second deposit of quartz, indicate a northerly movement. The bonanzas rise and spread out in fan-like forms, being richest towards the north, and again predicated that the most powerful currents (as was also the case with all the greater dynamical effects) were in that direction.

The above statements, from the brevity necessary in the columns of a weekly journal, do scant justice to Mr. King's elaborate articles, which are characterized by boldness and strong arguments. They were written over a year ago; but, as far as we know, subsequent explorations have, if anything, confirmed any statements made therein.

As to the continuance of the lode in depth, the article would be rather discouraging to some of the mines, while to others there would be no reasons for the cessation of ore, which might logically be expected at greater depths, if the immense masses of quartz have been injected from below, as would seem to be beyond doubt.

## Patent Fluting and Ironing Machine.

This little instrument is intended to answer two purposes, that of a polishing and a fluting machine. It is made of good material and highly polished; the fluting

apparatus made of brass is also well-finished. The construction and manner of using may be seen at a glance by referring to our illustration. A hinge at the point serves to connect the handle and bottom, where it is necessary to use for fluting, and when used for ironing it is closed and held in its place by a key, or catch, placed on top. When the iron is ready for use of course the fluter is also warm enough so only one heating is necessary. The machine flutes collars, cuffs and ruffles of every description, without injuring the fabric and with very little trouble. It is not intended for laundries or places where a large amount of fluting is done, but for family use where a machine of this kind would be likely to be a convenience in "doing up" laces, collars, etc. Weister & Co. are the general agents for this iron on the coast, and further information as to cost, etc., may be had by addressing them at No. 17 New Montgomery street.

Boston Common has produced three crops of hay this season.

## CARBOLIC ACID IN RUBBER HOSE.

At the large fire on Market street, last week, when the supply of hose was found to be inadequate to the wants of the firemen, Mr. J. W. Taylor, agent for the patent carbolized hose, promptly offered the use of 1,000 feet to the Department, which offer was accepted. It was found to stand the pressure admirably, without sweating, and was really of great use to the firemen. This, and the recent severe tests of this hose at Marysville, have served to bring it before the public on this coast; and the Board of Fire Underwriters recommending its adoption by the Fire Department, to the Board of Supervisors of this city, that body have ordered the purchase of 5,000 feet. The principal objections urged against the old leather hose are, its inability to stand pressure, and the fact of its "sweating." The carbolized hose is free from the latter defect; and, as an instance of its strength, 2,000 feet sustained, at the Marysville trial, a water pressure of 370 pounds to the square inch, without showing any flaw or weak point.

The great value of carbolized acid in the arts, says the *Engineering and Mining Journal*, is but just beginning to be fully appreciated. Its cheapness and abundance have rendered it a favorite disinfectant, deodorizer and antiseptic. How it acts in producing these effects is not clearly explained; but of its efficacy there is no doubt; and the new application of it to which we desire to call attention, is but another illustration of its already recognized properties. The liability of the old-fashioned leather hose to leak under pressure was troublesome enough, even in the days of volunteer departments and hand engines. But with the introduction of steam fire engines, which enormously increase both the volume of water thrown and the pressure per square inch on the hose, the leather hose, with their clumsy riveted seams, have become well nigh useless. Moreover, aside from actual bursting, there is a forcing of the water into the pores of the leather. It is almost impossible to dry the hose thus soaked; and the very process of wetting and drying, when applied to leather, soon destroys the strength of the material. In cold weather the wet hose freezes; and this not only causes great inconvenience in handling, but also, by the expansion of water in the pores, injures the texture. These evils, discovered in practice, have led to the substitution of rubber hose for leather. The rubber hose, as our readers are aware, is made of alternate layers of vulcanized rubber and cloth. As it is seamless and less permeable to water than leather, it is much superior to hose of the old style; and the number of large establishments now engaged in its manufacture indicates that this acknowledged superiority has become the basis of an extensive and flourishing industry. But a few years of actual use have considerably abated the enthusiasm with which the rubber hose was at first received. It is found that this material is not perfectly impermeable. Under the enormous pressure now common, it will sweat; water will penetrate the pores; and both from this cause and from atmospheric agencies and changes of temperature, the cloth will be afflicted by mildew, dry and wet rot, and the rubber itself, in the course of time, will become deteriorated or decomposed. It is at this point that the application of carbolized acid has been so remarkably efficacious. The exact nature of the processes involved in the decomposition of rubber hose is not understood; neither, as we have already remarked, is the action of carbolized acid thoroughly comprehended; but the mysterious remedy is certainly found to cure the inexplicable disease. In truth, this is the sum total of almost all cures; and if it suffices for doctors, why should it not, for the time being, satisfy firemen? Where Esculapius is at fault, surely Mose need not be overcurious! We recently examined a piece of stout canvas, which had been dipped in carbolized acid and water, and subsequently exposed to mildew. The carbolized acid being insoluble in water, and the process of soaking having been left purposely incomplete, the cloth was spotted—the darker places indicating where the acid had taken effect, and the lighter ones where the cloth had been merely wet with water only. The difference in condition was startling. A thread unravelled from a light spot was so rotten as to fall apart in the fingers, while the other end of the same thread, which indicated by its color the presence of the acid, could not be broken by main strength. Not less decisive is the effect of this agent upon the rubber itself, though this, of course, can only become evident after a considerable time. It then appears that when ordinary vulcanized rubber has become useless, the carbolized material seems to have suffered no change whatever. Possibly a part of this effect is mechanical, and due to the complete permeation of the mass by an insoluble substance; but this hypothesis is insufficient to explain the extraordinary durability of the result. The Metropolitan Fire Department now uses, exclusively, hose of this description, made by the Gutta Percha and Rubber Manufacturing Company, which has a patent for the chemical preparation. We observe that the circulars of this company do not say what is the nature of the chemicals employed. It can, however, do the patent no harm to betray, as we have done, the interesting fact that this remarkable result has been obtained by the

use of the agent we have named. It occurs to us that hose of this description would be a great boon to the hydraulic miner. It is not uncommon to find in the great hydraulic claims, hose under a head of one, or even two hundred feet of water, corresponding with a pressure of from forty-five to ninety pounds per inch, to say nothing of the momentum, or the enormous strain near the nozzle. Moreover, a leakage or bursting of the hose is more than a mere inconvenience to the miner. It is money running to waste. Every inch of water is paid for, and every inch should do its work. But our hydraulic miners are too often men who trade with the local dealers only; and few would be so enterprising as to send all the way to New York, just to get a hose that will last longer and wear better than any other. To supply this deficiency, the company have established an agency at 109 California street, in this city, under the charge of J. W. Taylor, who will furnish any desired information on the subject, and also show the article in question, of which he has a plentiful supply.

## PATENTS &amp; INVENTIONS.

## Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

## FOR THE WEEK ENDING SEPT. 19.

DRIVING-WHEEL OF LOCOMOTIVE ENGINES. Almond F. Cooper, San Francisco, Cal.

NOZZLE FOR OIL-CANS.—Sharron P. Doane, San Francisco, Cal.

WASHING MACHINE.—Henry Elford Lea, Half-Moon Bay, Cal.

BUNG AND BUNG-INSERTER.—Daniel Boone Rickey, San Francisco, Cal.

TRACTION-ENGINE.—Melvin A. Halstead, San Francisco, Cal.

## REISSUE.

FURNACE FOR SOLDERING.—Lewis Cutting, San Francisco, Cal., assignor to Francis Cutting, same place. Patent No. 71,141, dated November 19, 1867.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

THE CORNISH ENGINES.—Mr. Lean, "Engineering reporter," at a late meeting of Cornwell mine managers remarked substantially as follows:—"My duty is chiefly to report facts and figures, and I am very sorry that my figures bring out some facts which are detrimental to Cornish mining, at this time. The performance of Cornish engines has fallen off from 20 to 25 per cent, compared with what it was a few years ago. This is no doubt partly attributable to the machinery getting older, and the pipes becoming corroded; but I also feel assured that a large part of the falling off is due to the inferior quality of coals supplied to the mines." Mr. L. gave it as his opinion that the county of Cornwall, was losing from \$100,000 to \$120,000 per annum from the inferior quality of coal supplied to the mines.

LACK OF WATER.—The unusually dry summer that we have had this year has been a serious drawback to mining operations in the State, and there is a general complaint of a want of water. Both water and steam mills are idle in many places, and all that can be done is to get out rock and wait for rain. The gravel deposits require so much water to work them that many have been abandoned, temporarily. If, however, the prognostications of a wet winter prove true, the miners will go to work with redoubled energy, and California will show that her resources in this respect are not yet exhausted.

TEA AND WOOL SHIPMENT.—Fourteen car loads of tea, 418 bales of wool, and 12 car loads of cattle were sent East from this port in a single day by the Central Pacific Railroad.

NEW STYLE OF SULKY.—Mr. John A. Bilz, of Pleasanton, Cal., has an improved method of constructing sulkies, which is said to make his vehicles very popular.

It is said that hickory trees are dying all through Iowa, from some unknown cause.

## DOMESTIC ECONOMY.

### Professor Blot on Coffee Making.

Grind the coffee, rather fine than otherwise. I think it is usually ground too coarse. I use a coffee pot with a filter. You can get them at any tin store. Mixed coffee is best. I prefer mixture of Java, Mocha and Marseilles. Soft or spring water is best. Proportions, one quart of water to three ounces of coffee. Of course, it can be made stronger or weaker. Four teaspoonfuls make a quart of very good coffee for breakfast, but too strong for children.

In selecting a filter, or "coffee highin," choose one with a bottom of silvered gauze, instead of perforated tin, as the perforated bottom lets the finely ground coffee through. Good coffee cannot be made in what is wrongly called a coffee pot, which has no filter, and is much like a tea pot. Such a utensil requires the coffee to be boiled, which ruins it, leaving a bitter taste, and sends all the aroma to the attic.

When the water is boiling hot, put the coffee in the filter, and pour the water over it, and the coffee is made. If the water does not pass through fast enough, set the kettle on the fire again until the water in it boils, when pour it on again. If all the strength is not extracted at the first making, repeat the operation when needed. The coffee may be dark, even black, when strong, but it must be clear. Each kind of coffee must be roasted separately, and it is better to roast it a day or two before using.

**TO PRESERVE BREAD A LONG TIME.**—Circumstances sometimes occur when it is desirable to keep bread for a long time. It may be done in the following manner:—Cut the bread into thick slices, and bake it in an oven, so as to render it perfectly dry. In this condition it will keep good for any length of time required, and without turning mouldy or sour, like ordinary bread. The bread thus prepared must, however, be carefully preserved from pressure; otherwise, owing to its brittleness, it will soon fall to pieces. When required for use, it will only be necessary to dip the bread for an instant into warm water, and then hold it before the fire till dry, then butter it, when it will taste like toast. This is a useful way of preserving bread for voyages and also any bread that may be too stale to be eaten in the usual way.

**PRESERVED PEARS.**—Select large, juicy pears, wholly ripe, and pare them thin, leaving the stems on, but cutting out the black top at the blossom end of the fruit. Lay them in a pan of cold water, after paring. Then simmer the pears in this, half an hour. Then put them in a tureen, covering them with syrup, for two days. At the expiration of this interval, drain the syrup from the pears, and add a pound of sugar to each pint of the thin syrup. Stir in a very little beaten white of egg—say one white to three pounds of sugar—add some fresh lemon peel, grated, and set the syrup over a brisk fire, boiling it for ten minutes, and skimming well. Add lemon juice to flavor it, and put in the pears. Simmer them in this strong syrup until they are transparent. Take them out, spread them to cool, and put them into jars. Keep the syrup warm while the fruit is cooling, and pour it over them.

**CRACKED WHEAT.**—For a pint of the cracked grain, have two quarts of water boiling in a smooth iron pot, over a quick fire; stir in the wheat slowly; boil fast, and stir constantly for the first half hour of cooking, or until it begins to thicken and "pop up," then lift from the quick fire, and place the pot where the wheat will cook slowly for an hour longer. Keep it covered closely, stir now and then, and be careful not to let it burn at the bottom.

Wheat cooked thus, is much sweeter and richer than when left to soak and simmer for hours, as many think necessary. White wheat cooks the easiest. When ready to dish out, have your molds moistened with cold water, cover lightly, and set in a cool place. A handful of raisins added with the wheat is nice. Eat warm or cold, with milk and sugar.—*Herald of Health.*

**TO PRESERVE CLOTHES PINS.**—They should be boiled a few moments and quickly dried, once or twice a month, when they become more flexible and durable. Clothes lines will last longer and keep in better order for wash-day service, if occasionally treated in the same way.

**A TURKISH BREAKFAST.**—A Turkish breakfast comprises about thirty dishes. Soon after the first dish comes lamb, roasted on the spit, which must never be wanted at any Turkish banquet. Then follow dishes of solid and liquid, sour and sweet, in the order of which a certain kind of recurring change is observed, to keep the appetite alive. The pilau of boiled rice is always the concluding dish. The externals to such a feast as this are: A great round plate of metal, with a plain edge, of three feet in diameter, is placed on a low frame, and serves as a table, about which five or six people can repose on rugs. The left hand must remain invisible; it would be improper to expose it while eating. The right hand is alone permitted to be active. There are no plates, knives, or forks. The table is decked with dishes, deep and shallow, covered and uncovered; these are continually being changed, so that little can be eaten from them. Some remain longer—as roast meat, cold milks and gerkins—and are often resorted to. Before and after dinner they wash their hands. An attendant or slave kneels, with a metal basin in one hand and a piece of soap on a little saucer in the other. Water is poured by him over the hands of the washer from a metal jug; over one of his arm hangs an elegantly embroidered napkin drying the hands upon.

**THE ART OF PRESERVING LIVING FLOWERS.**—We gave something on the above some weeks since; but should suppose the following might be probable:—Heat fine white quartz-sand in an iron pot, and stir in some stearic acid and spermaceti, in proportions of half-ounce each, to every five pounds of sand. Taken from the fire, the whole is well mixed, and used as follows: A small box, with a drawer lid, with the bottom knocked out, is inverted, and a coarse piece of wire gauze placed inside, over the lid, which now forms the bottom. This sieve is then covered with a layer of the prepared sand. The flowers, promptly trimmed, are then placed on this sand, and completely embedded in more of it, to keep them in position. The box, covered with paper, is then placed in a room or oven, in which a temperature of one hundred to one hundred and ten degrees Fahrenheit is kept up, in which they will soon be dried. When this point is reached, the lid of the box is drawn, which causes the sand to fall out, leaving the dried flowers on the gauze.—*Bright Side.*

**AN EXCELLENT ECONOMICAL PUDDING.**—Pare and core half a dozen easily cooked apples, chop them into small bits; dry some bread in the oven—stale is the best—till it is crisp, then roll it into crumbs; butter a deep dish and place in it a layer of crumbs; then put in the apples, with a little sugar, and such spices as you like, cover the apples with another layer of crumbs, and so on, adding a little beef suet, chopped as finely as possible; pour in half a pint of milk; bake till nicely browned, and serve with hard sauce. Having many times made this pudding in our own family, we can speak advisedly of its excellence.—*Germanistown Telegraph.*

**KEEP THE KITCHEN AIR PURE.**—A little sink near a kitchen door-step, inadvertently formed, has been known, although not exceeding in its dimensions a single square foot, to spread sickness through a whole household. Hence, everything of the kind should be studiously obviated, so that there should be no spot about a farmhouse which can receive and hold standing water, whether it be the pure rain from the sky, the contents of a wash-basin, the slop-bowl, or the water-pail.—*Home and Health.*

**TO CLEAN SILVER.**—Wash in hot soap suds (use the silver soap if convenient); then clean with a paste of whiting and whiskey. Polish with buckskin, or clean with camphene. If silver was always washed in hot suds, rinsed well, and wiped dry, it would seldom need anything else.

**NEVER rub soap on flannel.** Make a suds by dissolving the soap in warm water. Rinse in warm water; very cold or hot water will shrink flannel. Shake them out several minutes before hanging to dry. Blankets can be washed in the same way.

**A VERY quick drying paint** may be prepared with half a quart of boiled oil, one gill, gold size, and dry color half a pound. This will dry in about an hour.

**MONOGRAM DOUGHNUTS** are the latest novelty among the F. F.'s. of Ohio.

### Domestic Receipts.

**HOME MADE SODA.**—Dissolve five ounces of tartaric acid, in four quarts of boiling water, to which add six pounds of white sugar, the whites of six eggs well beaten to a froth, and two tablespoonfuls of lemon, pineapple, vanilla, ginger, or any flavoring extract one chooses. Boil all together in a porcelain kettle for ten minutes, or until the sugar is dissolved. Just before taking from the fire, add the whites of the eggs, stirring in while you count 300 slowly. Strain, add the essence when taken from the fire, and bottle tightly. When desired for a drink, measure two tablespoonfuls of it into half a teaspoonful of baking soda or saleratus, and you will have a very good substitute for a glass of soda water, which will both cool and refresh you.

To whiten straw hats, scrape stick sulphur with a knife, mix the powder to a mush with water, plaster it thickly over the straw, and place in hot water several hours; brush off when dry. An easy and effectual plan.

To cleanse the inside of jars, fill them with hot water and stir in a spoonful or more of pearlsh; empty them in an hour, and if not perfectly clean, fill again and let them stand a few hours. For large vessels lye may be used.

For fruit stains on napkins, table cloths, etc., pour hot water on the spots—rub in hartshorn or oxalic acid, dissolved in water.

**TO RENDER FABRICS UNINFLAMMABLE.**—A good preparation for this purpose is a mixture of horax and sulphate of magnesia, or a mixture of sulphate of ammonia and sulphate of lime.

### Mechanical Hints.

**GREEN VARNISH.**—There is a most beautiful transparent green varnish, employed to give a fine glittering color to gilt or other decorated works. As the preparation of this varnish is very little known, an account of it may in all probability prove of interest to many of our readers. The process is as follows:—Grind a small quantity of a peculiar pigment, called "Chinese blue," along with about double the quantity of finely-powdered chromate of potash, and a sufficient quantity of copal varnish thinned with turpentine. The mixture requires the most elaborate grinding or incorporating of its ingredients, otherwise it will not be transparent, and therefore useless for the purpose for which it is intended. The "tone" of the color may be varied by an alteration in the proportion of the ingredients:—A preponderance of the chromate of potash causes a yellowish shade in the green, as might have been expected, and *vice versa* with the blue under the same circumstances. The colored varnish will produce a very striking effect in japanned goods, paper-hangings, etc., and can be made at very cheap rate.—*Cabinet-maker.*

**TO RESTORE FURNITURE.**—An old cabinet maker says the best preparation for cleaning picture frames and restoring furniture, especially that somewhat marred or scratched, is a mixture of three parts of linseed oil and one part spirits of turpentine. It not only covers the disfigured surface, but restores wood to its original color, and leaves a lustre upon the surface. Put on with a woolen cloth, and when dry, rub with woolen.

**PAINTING PAISLS.**—In painting the inside of wooden pails, no lead pigment should be used (as serious cases of poisoning have resulted from the contamination of the water by such pigments) but either whiting or gypsum, if a white color is insisted upon, or ochre, if the best material is desired, without regard to color.

**GUM TRAGACANTH MUCILAGE** can be prepared much more quickly and of a more uniform consistency, by first rubbing up the powdered gum with a little glycerine before the water is added; as in this way the formation of lumps is entirely avoided.

**FOR GLAZING LINEN.**—A compound may be made by adding to a pint of starch one teaspoonful each of salt and finely-scraped white soap, is recommended for the glazing of linen.

**ASHBERRYUM,** a substitute for Britannia metal, invented by Ashberry, of Manchester, consists of 80 parts tin, 14 of antimony, 2 of copper, 2 of nickel, one of aluminum, and one of zinc.

**TO PREVENT LAMPS FROM SMOKING.**—Lay the lamp-wicks in vinegar for an hour, and dry them well before they are used.

## LIFE THOUGHTS.

KIND feelings are benefits as much as kind deeds.

A MAN's actions, not his opinions, render him valuable.

BETTER he understood by ten than admired by ten thousand.

MANY a professing Christian has Jacob's voice, but Esau's hand.

He who reforms himself has done much toward reforming others.

THIS is the method of genius, to ripen fruit for the crowd by those rays of whose heat they complain.

THE higher you rise, the higher is your horizon; so, the more you know, the more you will see to be known.

He is happier who has little, and with that little is content, than he who has much, with impatience for more.

The first ingredient in conversation is truth, the next, good sense, the third, good humor, and the fourth, wit.

MANY men have the materials of happiness placed within their reach, but not one in ten knows how to manufacture anything out of them, except ennui.

A WEAK mind sinks under prosperity as well as adversity. A strong and deep mind has two highest tides—when the moon is at the full, and when there is no moon.

As there are none so weak that we may venture to injure them with impunity, so there are none so slow that they may not sometime be able to repay an obligation.

THE doors of fictitious pleasures are often closed and barred against us, that we may be forced to seek the approaches to real substantial happiness.

### Economical Habits.

With certain limitation it is true that a man who cannot save a margin from a small income, will never save anything from a large one. Wants are always more plentiful than dollars. The habit of self-denial is rather more easily cultivated when the means for supplying them are limited, then when more ample means have created new tastes and desires. Therefore, if you would grow rich, you must begin to save when you begin to acquire. A single dollar saved is often a larger proportion of actual necessities; than the thousands your rich neighbor places in the bank. Early savings have the longest time to grow. A dollar saved at twenty, will count as much as sixteen saved at sixty. Many young men spend in cigars alone, between the ages of fifteen and twenty-five, sums of money, which, if properly invested, would accumulate to an amount, by the time they reach fifty years of age, ample to meet the necessities of age, and to render them independent for the remainder of their lives.

**THE BEST HAVE THEIR FAILINGS.**—A painter was once engaged upon a likeness of Alexander the Great. In one of his great battles Alexander had received an ugly scar on the side of his face. The artist was desirous of giving a correct likeness of the monarch, and, at the same time, desirous of hiding the scar. It was a difficult task to accomplish. At length he hit upon a happy expedient. He painted him in a reflective attitude, his hand placed against his head, while his finger covered the scar. The best men are not without their failings—their scars—but do not dwell upon them. In speaking of them to others, adopt the painter's expedient, and let the finger of love be placed on the scar.

**FORTUNE.**—"I am old enough," says Smollet, in a letter to his friend Garrick, "to have seen and observed that we are all playthings of fortune; and that it often depends upon something as insignificant and precarious as the tossing up of a half-penny, whether a man rises to affluence and honors or continues to his dying day struggling with the difficulties and disgraces of life.

**COMPENSATION.**—If thou hast wronged thy brother in thought, reconcile thee to him in thought. If thou hast offended him in words, let thy reconciliation be in words. If thou hast trespassed against him in deeds, by deeds be reconciled to him. That reconciliation is most kindly which is most in kind.

**WORK** with a zeal and a purpose. Let the soul go forth in a full tide of love to all mankind, counting all men as brothers whom God appoints to walk in and about our paths.

## Business Cards.

**JOHN ROACH, Optician,**  
Has removed from 522 Montgomery street to  
540 Washington street,  
East of Montgomery.  
Surveying Instruments made, repaired and adjusted  
25v17-3m

**E. J. FRASER, M. D.,**  
SURGEON,  
No. 102 Stockton Street, San Francisco, Cal.

**Farmers and Mechanics  
BANK OF SAVINGS,**  
No. 235 Sansome Street.  
Interest paid on Deposits. Money Loaned on Real Estate.  
**H. DUTTON, President.**  
GEO. M. CONDEE Cashier. 19v16-3m

**BARTLING & KIMBALL,  
BOOK BINDERS,**  
Paper Rulers and Blank Book Manufacturers.  
605 Clay street, (southwest cor. Sansome),  
15v12-3m SAN FRANCISCO.

**SAN FRANCISCO  
CORDAGE COMPANY.**  
Manila Rope of all sizes. Also, Ballo Rope and Whale  
Line constantly on hand. Mining Ropes of any size  
and length manufactured to order.  
**TUBBS & CO., Agents,**  
611 and 613 Front street.

**SAN FRANCISCO MILL.**  
**HOBBS, GILMORE & CO.,**  
Manufacturers of Boxes,  
Market Street, bet. Beale and Main.  
For sale—Mahogany, Spanish Cedar, and other Woods.

**JOSEPH GILLOTT'S  
STEEL PENS.**  
Sold by all Dealers throughout the World.

**J. F. PAGES,  
SEAL ENGRAVER,  
AND LETTER CUTTER.**  
Brass and Steel Stamps and Dies, 608 Sacramento street,  
San Francisco. Orders by express promptly attended to.

**L. SCHUMANN,  
PIONEER  
Meerschamup Pipe Manufacturer,**  
No. 341 KEARNY STREET,  
Between Bush and Pine streets, San Francisco.  
The first and only Manufacturer on the Pacific Coast.  
MEERSCHAUMS MOUNTED WITH SILVER. Meerschamup  
Pipes Boiled and Repaired. Amber Mouth-pieces Fitted.

**The Merchants' Exchange Bank  
OF SAN FRANCISCO.**  
Capital, One Million Dollars.  
LEVI STEVENS.....President.  
B. N. VAN BRUNT.....Cashier.  
BANKING HOUSE,  
415 CALIFORNIA STREET.  
25v20-qy

**INTERNATIONAL HOTEL,  
San Francisco, Cal.**  
This Favorite House is located on Jackson street, a  
few doors west from Montgomery; offers the greatest in-  
ducements for Families. The International Coach will  
be at each Car Depot and Steamboat, plainly marked In-  
ternational Hotel, to convey passengers to the Hotel  
FREE, and to any part of the city at reasonable rates.  
F. E. WEYGANT & H. C. PARTRIDGE,  
Proprietors.  
24v22-3m

**OCCIDENTAL  
Insurance Company  
OF SAN FRANCISCO.**  
and Capital, \$300,000  
GOLD COIN  
OFFICE, 436 CALIFORNIA STREET.  
Fire and Marine Insurance.  
All Losses paid in U. S. Gold Coin.  
A. G. STILES, President.  
B. ROTHSCHILD, Secretary. 20v17

**BETTS'S CAPSULE PATENTS.**  
To prevent INFRINGEMENTS, NOTICE IS HEREBY  
GIVEN, that BETTS'S NAME IS ON EVERY CAPSULE  
he makes for the principal merchants in England and  
France, thus enabling vendor, purchaser, and consumer,  
not only to identify the genuineness of the Capsule, but  
likewise the contents of the vessel to which it is applied.  
The Lord Chancellor, in his judgment, said that the Cap-  
sules are not used merely for the purpose of the ornament  
but that they are serviceable in protecting the wine from  
injury, and insuring its genuineness.  
MANUFACTURERS—1, WHARF ROAD, CITY ROAD,  
LONDON, AND BORDEAUX, FRANCE.

## Eastern Advertisements.

**G. L. WILD & BRO.'S  
PATENT DANCING TOY FOR PIANOS,**

A Scientific Musical Toy by which inanimate figures are  
Charmed into Life by Music!  
Illustrated in No. 9 of the "Scientific Press," and  
also in No. 9 of the "Pacific Rural Press."  
The PATENT RIGHT for the Pacific States for sale.  
Address **O. L. WILD & BRO.,**  
420 Eleventh street, Washington, D. C.  
Inventors and Manufacturers, and Dealers in Pianos  
and Musical Merchandise generally. 9v23-3m

**Peteler Portable Railroad Co.,**  
OFFICE, 42 BROADWAY, NEW YORK.  
TO CONTRACTORS, MINERS, ETC.

By this invention, one man, with one horse and five  
cars, does the work of ten men, ten horses and ten carts.  
Highly Approved by all who Use Them  
CARS AND TRACKS FOR SALE OR TO LET  
Samples at this office. Illustrated Circulars free.  
State and County Rights for Sale.

## STEPHENS &amp; CO.,

MANUFACTURERS OF

**U. S. STANDARD BOXWOOD AND  
IVORY RULES.**

ALSO EXCLUSIVE MANUFACTURERS OF

**L. C. Stephens' Patent Combination Rule.**

This cut represents the COMBINATION RULE, which  
comprises a Foot Rule, Spirit Level, Try Square, Bevel,  
Plumb, Slope Level, Etc.  
It is made of the very best quality of Turkey Boxwood,  
heavily bound with brass, and is graduated with math-  
ematical accuracy.  
The Square is adjustable, and can be tested and made  
perfectly true by the aid of a small screw-driver, but  
this is seldom required.  
In its application as a Slope Level it is especially  
adapted for Miners' use, as it shows the pitch to the  
foot, and DEGREE OF INCLINATION at once. It is six  
inches long when folded, by one and three-eighths wide,  
and three-eighths inches thick, the cut being just one-  
fourth size.  
"By the use of one of these, a builder, mason, car-  
penter, or other workman, can always have in his pocket  
the most valuable of his apparatus used in construction,  
combined in a portable, useful and cheap form."—Scientific  
American.  
Price by mail, prepaid, \$4. For agents' terms, address

## Notes on Contributions to our Cabinet\*

No. 527.—We have received a beautiful piece of gold-bearing rock from Messrs. Coyne, Lang, McLennon & King, owners of the "Golden Chariot" ledge, Banner District, San Diego Co., Cal. The rock is fine bluish quartz and plentifully sprinkled with free gold. The gentlemen inform us that the ledge proper in this mine is nine feet wide, although with the small seams, etc., it makes up 13 feet. There are two shafts on the ledge, the main one seventy feet deep. Free gold has been found in the croppings for a distance of 800 feet. The last thirty tons crushed yielded \$156 per ton, and there are now 100 tons on the dump waiting shipment to the mill.

We have been informed by some parties from San Diego County that they have several times sent us specimens as contributions to the cabinet of the SCIENTIFIC PRESS and that no notice was taken of the circumstance as is usually done. As the specimens in question were rich in free gold, the cupidity of those through whose hands they passed on their way hither, must have been the reason for their non-arrival. Supposing that perhaps this may have happened in other cases, without our hearing of it, we hasten to assure our readers in the mines, that such tokens are especially acceptable to us, and that all ores, minerals, etc., which come to hand, are noticed in the proper place, without exception. Where it is possible, the characteristics of ore, etc., are spoken of, although our correspondents frequently neglect to give us any data concerning what is sent. The proper way to send samples of ore, minerals, fossils, etc., is to ship by Wells, Fargo & Co.'s Express, *prepaid*, and we will be sure to get them. When entrusted to private hands, parcels are often lost either through carelessness or dishonesty.

\*Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., adds much to the value of such specimens.

## Ladies Among the Scientists.

The British Association for the Advancement of Science, at its late annual meeting at Edinburgh, admitted females to take part in the proceedings. Mrs. Becker, of Manchester, by special invitation prepared and presented a paper on "The Employment and Wages of Women," one of the most striking points of which was the presentation of certain facts going to show that among the working classes in England the lighter work was by no means apportioned to women—a course which tended to subvert the general principle of giving to the weaker the lighter burdens.

It is said that this admission of women to the deliberations of the Society was most cordial, and the impression produced was very favorable to the ladies and the cause they are so zealously pushing forward—the franchise movement, of which Mrs. Becker is a prominent advocate.

PURE BLOOD SHEEP AND GOATS FOR OREGON.—Messrs. Thos. Butterfield & Son, of Hollister, Cal., are taking 14 head of pure blood Cotswold sheep and 25 Cashmere goats for exhibition to the Oregon State Fair, at Salem, Oct. 5th. We believe they will make a fine exhibition. One Cotswold ram weighs 350 lbs. It is the owner's intention to sell the stock in our neighboring State.

WOMEN govern us anyhow; let us then strive to render them as perfect as possible. The more they are unenlightened, so much the more shall we of the opposite sex be. On the cultivation of the mind of women depends the wisdom of men. It is by wisdom that nature writes on the hearts of men.

RIVERSIDE COLONY.—Some time since an association was formed for the purpose of establishing a colony in San Bernardino county, Cal., and circulars were issued, setting forth the advantages of the location, climate, etc. We are informed that thus far the scheme has been a success, although the Magdalena Bay failure has done much to retard the progress of this and other genuine enterprises of the kind. The lands owned by this association are located in the valley of the Santa Anna, San Bernardino county, between the towns of San Bernardino and Anaheim, about 40 or 50 miles from the ocean. The settlement is on the banks of the river, on a bluff about 100 feet above it. An irrigating ditch has been dug, which is 12 miles long, 8 feet wide, and 3 feet deep, with a fall of about one inch to the rod, through which the water flows rapidly. There are now about a dozen families in the valley and our informant states that they are all perfectly satisfied with the prospects ahead. About 100 acres of corn are now growing, but as yet no grain, for the reason that the ditch was only completed in the latter part of July. Judge North, Dr. Greaves and several other members of the association have set out small orchards and are growing, successfully, orange, lemon, olive, fig, apple, pear, grape, and numerous other fruit trees.

We are assured that this is no land-grabbing scheme, but a *bona fide* enterprise for the purpose of securing both for the members of the association and others, homes at a small expense.

OVERLAND MONTHLY.—The new feature in the *Overland Monthly* for October consists in the introduction of illustrations for the first article. The subject is "Tropical California," and the wood-outs are scenes and objects in the southern part of our State. The contents of this number are: "Railway Stations," "Placer," "In the Sierras," "On and About the Avon," by Joaquin Miller; "The Wilds of Western Mexico," "The Stewardess' Story," "The Oregon Indians," "Almost," "The Language of Confucius," "Ideal Womanhood," "Indifferent Metallurgy," "The Mysterious Lady of Nisqually," "Cultivation of the Present," "From Year to Year," and the usual Book Notices.

PURITY OF THE BALLOT.—Most of the political evils with which this county is afflicted is traceable to the use of money in buying influence. The English, recognizing this fact, have proposed a law absolutely invalidating the election of any candidate who by himself or agent shall spend money to secure his own election. We cannot under our Constitution pass so sweeping a measure as that, but we can and should so arrange matters as to pretty effectually eliminate the power of money from our political contests.

THE POTATO BLIGHT is threatening great destruction to the crop in Ireland. It has made its appearance in many localities, and fears are entertained that it will become general. A potato blight in Ireland cannot, now, however, work the damage it has done in years ago, for the reason that much corn is now grown there, and the peasantry have learned to eat Indian meal. The corn crop is promising, and no fears are entertained there of being anything like a serious famine.

LAST WEEK'S RECEIPT OF FRUIT.—Mr. Lusk, of the Pacific Fruit Market makes the following return of fruit received in this city last week:—

Six thousand boxes and 3,000 baskets of apples, 3,000 boxes and 900 baskets of peaches, 1,800 boxes of plums, 8,400 boxes of grapes and 4,800 boxes of pears, besides any quantity of minor fruit, were received. Eight hundred or 900 boxes of pears had to be thrown away, owing to a glut in the market.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

SUCCESS IN BUSINESS.—Success in the business world usually depends upon being thoroughly prepared for its duties. Young men if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24 Post street, San Francisco. This is the only school on the Pacific Coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book-keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which cannot be discussed here. Call at the College and examine its workings. If unable, send for circular, and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address E. P. HEALD, President, Business College, San Francisco, Cal. 10v23hp-3m

UNIVERSITY OF CALIFORNIA.—The Preparatory Department is under the charge of five Professors of the University, and six tutors. Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-keeping are taught. Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TART, Oakland, Master Fifth Class. sc9hpt

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 76 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 23v1-12mbp

LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 294 Bowery, 167 E. 26th, 477 9th Ave., New York Good work at high prices if desired. 21v1-12mbp

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

## To Lease.

A promising mine in a locality easy of access. Wood and Water plenty and near. Full particulars given by "W. H.," at this office. 12v23-1m

## A Novelty Printing Press for Sale.

It is a new foot-power Press, and just the thing for a small country job office or for amateur printers, and druggists and others who wish to do their own printing. At manufacturers' price, with freight added. Enquire at this office. 11v2tfr-1ams

## IMPORTANT TO MINERS.

A CHEAP AND DURABLE DEVICE FOR SAVING FINE GOLD AND QUICKSILVER.

Frey's Improvement on Evans' Undercurrent Sluices.

This is a sluice made of cast-iron, with transverse corrugations on the bottom, semi-circular in shape and three inches deep. At the bottom of each alternate corrugation is a narrow slit through which the heavier material falls down into another rut below with larger corrugations. Both rittles are set on the same grade, which should be about one foot in twelve. The lower box is charged with quicksilver. These Sluices do not clog, nor do they require any attention beyond cleaning up once a week. These sluices have stood the test of use in quartz mills below all the contrivances for saving gold, and have made large returns of gold, silver, concentrated sulphur and quicksilver, that would otherwise have been lost. From the Green mine, Ophir District, Placer county, I have received the following certificate:

OPHIR, August 6th, 1871.  
DR. JOS. M. FREY.—Dear Sir: Having been engaged as amalgamator in Green & Co.'s mill, where we are using the Frey's pans and settler, and having below the settler a set of Frey's Undercurrent Sluices and Rittles, I am well satisfied, after some sixteen years experience in the use of various modes and machines for amalgamation of ores, that your Rittle is capable of concentrating and saving most of the fine quicksilver and light amalgam, in which consists the great source of loss by every known process of working ore.

(Signed) Yours respectfully, J. R. MORKLAR,  
Also, from E. N. Rottie, of Nevada Metallurgical Works, 21 First street, San Francisco:

Dear Sir: Having had opportunity to watch your Corrugated Rittles, in operation for over a month at Reno, I can say that these Rittles work splendidly as quicksilver savers and concentrators of unroasted ore. I have also no doubt that they could save very fine gold, as for instance in black sand or slimes, better than any like apparatus in use. Respectfully, (Signed) E. N. RIOTTE.  
Assay of tailings saved at the Rhode Island Mills, Nevada, by these Sluices:  
Gold.....\$75 24  
Silver.....76 96  
Quicksilver.....250 lbs. to the ton  
This was the saving of one week.  
For further particulars address WATERS & CO., No. 54 J street, Sacramento, the Agent for the State. sc23-3m

## Phelps' Patent Animal Trap,

FOR GOPHERS, SQUIRRELS, RATS, CAYOTES, and other "Varmints."

This Trap, as may be seen, is of simple construction, and not likely to get out of order, and very durable.

It is Very Efficient and can be used conveniently by women or children. THE CHEAPEST AND BEST YET INVENTED. Price 50 cents. By mail, prepaid (to places where express charges are high), \$1. A liberal discount to clubs or dealers who buy by the dozen. Address the inventor and manufacturer, D. N. PHELPS, al-1y-awbp San Leandro, Alameda County, Cal.

## EIGHTH MECHANICS' FAIR.

Send for Circulars.

Under a Burning Sun, where Bilious affections and Fevers of various descriptions so generally prevail, Tarrant's Effervescent Seltzer Aperient Has been successful beyond all parallel. Hence the physicians of the tropics give it their emphatic sanction, prescribing it in preference to every other aperient in use. The patients, of course, gladly acquiesce, for this preparation is one of the most delightful, as well as mild and cooling cathartics, chemistry has yet devised, and possesses every medical virtue of the far-famed German Seltzer Spa. It is a powder that only requires the addition of water to produce in an instant a delicious effervescent beverage, as well as an invaluable medicine. Ask for and accept none but the genuine.

SOLD BY ALL DRUGGISTS.

## The California Powder Works

No. 314 CALIFORNIA STREET,  
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,  
MINING,  
And BLASTING  
POWDER.

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our  
HERCULES POWDER,  
Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.  
A circular containing a full description of this Powder can be obtained on application to our Office.  
16v20-3m  
JOHN F. LOHSE, Secretary.

## Mining and Other Companies.

Outing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—about 10 o'clock—in the very latest hour we can receive advertisements.

**Alameda Coal Mining Company—San Francisco and Alameda Counties, State of California.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 7th day of September, 1871, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, 409 Battery street (first floor), between Clay and Merchant streets. Any stock upon which said assessment shall remain unpaid on the 9th day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 30th day of October, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
M. PHILLIPS, Secretary.  
Office, 409 Battery street, San Francisco, Cal. sc104w

**Bellevue Mining Company—Location of works, Ophir District, Placer County, California.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of August, 1871, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 409 California street (up stairs), San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 3d day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 23d day of October, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
T. F. CROISE, Secretary.  
Office, 409 California street, San Francisco, Cal. sc24w

**Gold Run Mining Company—Location of works, Gold Flat District, Nevada County, California.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of September, 1871, an assessment of twenty-five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at their office, No. 225 Sansome street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 10th day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the 1st day of November, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
C. C. PALMER, Secretary.  
Office, 225 Sansome street, San Francisco. sc24w

**North America Consolidated Mining Company—Location of works, White Pine County, State of Nevada.**  
Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 31st day of July, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. of Shares.	Am't.
Eaton, J. A. Trustee.....	62	100	\$20 00

F. S. Spring, Trustee.....	41	120	2400 00
E. F. Denison.....	42	1	20 00

And in accordance with law, and an order of the Board of Trustees, made on the 16th day of August, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, 409 California street (up stairs), San Francisco, Cal., on the 16th day of October, 1871, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.  
T. F. CROISE, Secretary.  
Office, 409 California street, San Francisco, Cal. sc30-3w

**Piermont Milling and Mining Company—Location of works, Piermont Mining District, White Pine County, Nevada.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the fourth (4th) day of September, A. D. 1871, an assessment (No. 1) of one dollar and twenty-five cents per share was levied on the capital stock of said company, payable immediately, in U. S. gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 9th day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 27th day of November, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale.  
J. W. CLARK, Secretary.  
sc34w

**Pocahontas Gold Mining Company—Location of works, Mud Springs, El Dorado County, Cal.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 18th day of September, 1871, an assessment of three dollars (\$3) per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 419 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 28th day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 27th day of November, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
D. A. JENNINGS, Secretary.  
Office, Room No. 26, 419 California street, San Francisco, California. sc23-td

## THE SELDEN PUMP.

Combines Simplicity and Durability to a Remarkable Degree.

Its parts are easy of access, and it is adapted to all purposes for which Pumps are used—especially Mining.

Full description in *Scientific Press* of August, 1871.

Catalogues sent on application.

A. CARR,

43 Cortlandt Street, New York.

AGENT WANTED for Pacific Slope.

## I. N. WILFONG'S

PATENT CIRCULATING

## STEAM BOILER.

This cut represents an improvement on the old style of Cylinder Boiler, and combines all the following great advantages: Rapid circulation and generation of steam; economy in fuel; durability, safety, and simplicity of construction; requires but little attention; is easily repaired, and moderate at first cost.

We have now a number in successful operation, and respectfully refer to the following well known parties: Hastings & Co., Seventh and Cherry streets; Jos. Lea & Co., 128 Chestnut street; J. S. Huber, Oermantown; Holt & Bro., Sixth and Susquehanna avenue; Albion Print Works, Conshohocken, Pa.; S. H. Dickey, Oxford, Pa.—all of which are giving ENTIRE SATISFACTION. Parties wishing to investigate the success of our New Boiler can do so by calling at any of the above named places, or to

I. N. WILFONG,

131 and 135 North Twenty-second St.,

PHILADELPHIA, PA.,

Manufacturer of all descriptions of Boilers (Rogers & Black's patent included), Tanks, Still, Pans, and general Iron Work. Orders solicited from all parts of the country, and, when received, promptly attended to. State and County Rights and Royalties for sale as above. 6v23-6m-cow

## SANBORN &amp; BYRNES,

South Point Mills, Berry Street,

Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of Stair Material furnished to order. Wood and Ivory Turners Billiard Balls and Ten Pins. Fancy Novels and Balusters. 21v22-5m.

STEINWAY & SONS' Patent Agraffe Pianos, GRAND, SQUARE AND UPRIGHT.

Pianos to Let.

A. HEYMAN,

I street, between Sixth and Seventh, Opposite old Capitol, SACRAMENTO.

## Longshore's Combination Tool.

This device is just what its name indicates. As a KITCHEN Tool it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pincers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

WIESTER & CO.,

17 New Montgomery street (Grand Hotel), SAN FRANCISCO.

THE

Gutta Percha and Rubber Manufacturing COMPANY,

109 California street, SAN FRANCISCO.

Patent Combination Carbolic Ssams Fire Hose, Steam and Petroleum Oil Hose, Suction Hose, Hydrant Hose, Conducting Hose, Engine Hose, Round Packing, Rubber Belting, Packing, Valves, Caskets, Pure Vulcanized Sheet Rubber, Fire Buckets. 12v23-3m J. W. TAYLOR, Agent.

## Ophir Copper, Silver and Gold Mining Company—Location of works, Ophir, Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the second day of August, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

**GARRATT'S CONDENSING LUBRICATOR,**

Or "TALLOW CUP." This is a California invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION:—D, is a glass chamber which contains the lubricant. O is a valve, connecting with cup which introduces the lubricant into chamber D. E, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. F, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the injection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and G. 1e18-tf

THE PATENT  
Novelty Mill and Grain Separator

R. STONE  
S.F.

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to

WALTHAM WATCHES.

In soliciting anew the public patronage of WATCHES of domestic production, the AMERICAN WATCH COMPANY respectfully represent:  
That no fact in the history of manufactures is more completely demonstrated than that the best system of making Watches is the one first established by them at Waltham. That system always had the warrant of reason and common sense, and now the test of time in the trial of the Watches themselves cannot be denied to have been ample and satisfactory. It is admitted on every hand—the evidence of daily observation and common repute—that the Watches not only keep correct time, but that as machines they ENDURE. It should seem that nothing more is needed, but that their sizes, shapes and appearances should suit the tastes of the people. As to all these conditions the American Watch Co. are now fully prepared to answer the exactions of the market. They confidently assert there is no longer any need for such reasons to import watches of any description whatever. Every size in ordinary demand, every shape and every variety of finish and decoration, may now be had. And as to price, the recent reductions leave no room for doubt that the Waltham system of Watch-making is

The Most Economical as well as the Most Reliable,  
And that the Waltham Watch is the Cheapest as well as the Best.  
Many new varieties of movements have been added during the last year, all of which display the Latest Improvements in design and finish, and evince the rapid progress the Company is making toward perfection in the art. Among these the new small size Watch, for Boys and young gentlemen, is to be specially noted. A very low price has been made for this Watch because it is a boy's watch, and with the object of bringing it within the means of boys of all classes. Price being considered,

No such Watch, in Quality and Beauty,  
Has ever, in any country, been produced.

The "CRESCENT-STREET" FULL PLATE WATCH, added during the last year, is now made either with or without stem-winding and setting attachment. This Watch, in either form,  
The Company Challenges all Manufacturers of all Countries

To beat or equal for its price. It is made with all the latest improvements in every part—improvements which improve—and which not only make it better for its purposes as a time-keeper, but will make it the great favorite with Watchmakers. This, the highest grade of full plate Watches made in this country, in size and appearance, in finish, and general excellence, is especially intended for and recommended to business men, and in particular to Railway and Expressmen, to constant travelers—in fact, to all live men who must be told by their Watches the correct time of day whenever they want it. All such men should have the

"American Watch Co., Crescent Street."

Counting on such destination for this variety of their manufacture, the company devote the greatest care to its construction, employ upon it only their best men and best machinery, and issue it with their reputation at stake upon its success.  
For sale by all leading jewelers. No Watches retailed by the Company. For all other facts address

Varney's Patent Amalgamator.  
These Machines Stand Unrivaled.  
For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.  
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.  
This Amalgamator Operates as Follows.  
The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.  
Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.  
Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

## PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON  
SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:  
Being built of wood entirely, they are not affected by change of temperature.  
The timber used is placed so directly in the line of strain, that less material is required to support the same load.  
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.  
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.  
Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.  
F. MALOON, Secretary.

## AMMONIACAL PREPARATION

—FOR THE—

Prevention and Removal of Boiler Scale.

MANUFACTURED BY THE

San Francisco Gas Company.

F. I. CURRY, Sole Agent, San Francisco Boiler  
Works, 123 and 125 Beale street, San Francisco.

This Preparation is proved by the experience of many  
of our best machinists and engineers to be a perfect cure  
for the vexatious and dangerous incrustation known as  
Boiler Scale. It is sold in 5-gallon cans at \$5.25 per  
can, or in cases of two cans each at \$10.50 per case.

The San Francisco Gas Company also manufactures

Carbonate of Ammonia.

Muriate of Ammonia.

Sulphate of Ammonia.

Liquor Ammonia, Concentrated.

Aqua Ammonia, F. F. F.

Concentrated Crude Ammonia, for Ice  
Making and other manufacturing purposes.

## Portable Steam Engine.

The utility of the portable steam engine is no longer a question. Its rapid introduction for permanent, as well as temporary uses and the constantly increasing demand for this form of motive power, has directed our best mechanical skill to its perfection. The engine represented in our cut is permanently mounted, and can be moved with as much facility as a loaded wagon. It is supplied with an ash pan, all possible precaution being taken to protect the surrounding material from danger of fire, and is desirable for many purposes. As will be seen by the cut, there is very little machinery, and the simplest possible mechanism is used in the working parts, so that there is no liability to get out of order.

The boiler is of the locomotive pattern, large fire box, and of great steaming capacity; there is ample water and steam room, and a large steam dome made of wrought iron, in the top of which is a man-hole of size sufficient to admit free access to the interior. This access is of vital importance in removing scale and sediment; the want of which often proves destructive to life and property.

The engine is attached to a bed plate accurately fitted and securely bolted to the surface of the boiler, at its center. The cylinder is attached to one end of this plate, and the main shaft at the other. This plate receives all the strain of the engine, entirely relieving the boiler sheet; all parts of the engine are attached to this plate and can be removed at will and replaced without fear of disarrangement. The main shaft works in brass boxes, which are fitted to standard seats, and can be duplicated, insuring a perfect alignment without recourse to a skilled mechanic to re-line and habbit the main boxes. The piston has metallic packing. The force pump is supplied with brass ball valves. The crank is accurately balanced. The steam exhausts into the smoke-head, creating a powerful draft. The water is thoroughly heated after it leaves the force pump, by the exhaust steam in the heater, located under the cylinder and slides; in short, it is a duplicate of the most approved locomotive.

The lift pump is located at the opposite side of the boiler, and not seen in the cut. It is driven by a belt at one-third the speed of the engine. The water is raised to a greater altitude than the force pump, thereby filling the force pump by gravity, instead of suction, insuring a positive

action. For further information concerning these engines, address Lane & Bodley, corner John and Water streets, Cincinnati, Ohio.

## Land Decision.

Judge Field rendered a decision last week in the United States Circuit Court, which affects the interests of many persons in Nevada. The Central Pacific R. R. Co. brought suit to quiet title to a number of pieces of land claimed by settlers who had made their locations on the line of the road, after the passage of the bill, but before the route was determined. These

## An Alleged Wrong Among Miners.

We are assured by well-informed persons that a report is believed to a considerable extent in certain localities in this State and Nevada, which reflects seriously upon certain Cornish foremen or mining captains. This is not a mere rumor, which we should pass by unnoticed, but a charge which, from the extent to which it is believed, we cannot pass over in silence.

This charge is not made against Cornishmen as a class, but upon a certain number of Cornishmen; but we believe only Cornishmen are accused as yet. Nor has the charge, we are glad to say, been proven

found in the mines. This last evidence is manifestly insufficient to sustain the charge. As to the direct statements, we, at a distance, are unable to judge of their credibility. While we cannot deny that the accusation may be true in certain cases, we believe that it cannot hold as a general assertion.

We cannot refrain, however, in view of the possibilities, from calling the attention of workmen to the great evils to themselves and others which would result from such a system. In regard to excluding all but one's own nationality, the plan is wrong. It is perhaps natural to prefer our own countrymen, and the feeling is praiseworthy to a certain extent, but carried too far it becomes provincial and foolish. No one land contains all the best and wisest of men and has no fools or knaves. And in our free country, where we boast of welcoming all men, recognizing no distinctions of class, the matter is particularly out of place.

With regard to the levying of blackmail by the foremen, we cannot too strongly express our disapprobation. This system prevails, it is believed, to a large extent among the Chinese. Our Cornish miners will certainly refuse to adopt the custom from this people. This system would work the greatest injury to the workmen themselves. It would repress merit, discourage skill, give rise to deceit and laziness. It would prevent the meritorious from rising above their present positions, would impose class distinctions more burdensome than now exist in some other parts of the world; would create a new order of matters, despotic in their power and unjust in their rule; would make the workmen abject slaves.

Of the wrong to employers we need not speak; this evidently would be very great and would lead to serious troubles.

Let no one think that the above is dictated by prejudice against Cornishmen or in order to create a feeling of distrust against them. With regard to Cornish miners we have none but the best wishes. We know that to their acknowledged skill our country is deeply indebted for its growth and prosperity. But the charge against some few of them has obtained to a certain extent and cannot therefore be longer neglected. The best way to dispel an unjust accusation is to give it publicity; the most effective method of stopping a concealed wrong is to bring it to light.

Those who think the oil wells of Penn. have failed, may be surprised to learn that petroleum in this country is on a steady increase. In 1860 we exported 1½ millions of gallons; in 1868, 99,000,000, and last year 141,000,000. The increase in the flow of oil in Pennsylvania since 1867, has been nearly 50 per cent.

LANE & BODLEY'S PORTABLE STEAM ENGINE.

tracts were owned by the company, and the settlers demand damages and threaten to bring suit. The company forestalled them by a suit to quiet title. Justice Field decides that the grant to the railroad went into effect when the bill passed; the settlers took their claims subject to the provisions of the bill; and the rights of the company to the land are not dependent upon the date when the road was located. These points arose on a demurrer, but as that raised all the material questions in the case, the decision overruling the demurrer virtually finished the suit.

**A RICH MINE.**—The Sydney (Australia) Herald says that the Caledonia Co. of New Zealand recently divided \$375,000 among the shareholders, as the result of 14 days' working. Five hundred and sixty tons of quartz yielded 25,000 ozs.—about \$425,000.

with certainty, so far as we know. But its effects are such that it becomes a matter of justice to all parties that the matter should be ventilated, in order that the accusation may be stepped, if ungrounded, or the wrong done away with, if it actually exists.

The charge is this: That Cornish foremen, to a greater or less number, have adopted a system of getting rid of persons of other than their own nationality, no matter how great their merit may be, in mines where they have the power of hiring and discharging the workmen, employing only Cornish miners, from whom, in return, they receive a certain portion of their wages. This charge is founded on direct statements made by miners, and is thought to be sustained to a considerable degree by the fact that in certain cases none other than Cornishmen are to be

## MECHANICAL PROGRESS.

### Water-Pressure Engines.

In mountainous regions, where water under a considerable head of pressure can be had, it may be advantageously utilized, for pumping, hoisting, or other mining operations requiring power, by means of hydraulic engines and surface or underground wheels. There are many places on the Pacific coast where these engines can be introduced with advantage. They are usually constructed for pumping only, and are single-acting, with long cylinders placed vertically over the pump-shaft, the pump-rod being simply a prolongation of the piston-rod. The water is admitted to the under side of the piston, and when it has run its upward stroke, the water is allowed to flow out, and the piston descends.

The absence of any sensible elasticity in water renders the motions resulting from its use under pressure in engines, susceptible of perfect control; but the same inelasticity causes sudden shocks and blows to the moving parts if the inlets and outlets be made as in engines operated by the elastic fluids, steam and air. It is therefore necessary to use valves of peculiar construction, by which the flow of the water may be gradually increased or slackened, and to provide other means for preventing impact and securing smoothness of action.

Many such engines have been constructed for pumping mines abroad, and have operated successfully for long periods, with very little expense or attention. One was erected by the engineer Trevethick at the Alport mines, in the year 1803, and worked continuously for forty-seven years, until 1850, when the work upon the mines ceased. In this engine, the water was admitted first on one face of the piston and then upon the other, alternately, and the inlets and outlets were opened and closed by two pistons at the side.

An engine erected by Mr. Darlington at these mines had a cylinder 50 inches in diameter and a stroke of 10 feet. The cylinder was placed directly over the shaft, and the piston and pump-rod were continuous. The column of water was 132 feet high, and gave a pressure upon the piston of about 8 pounds to the square inch, or more than 50 tons upon its area. Water was raised from a depth of 22 fathoms, by means of a plunger 42 inches in diameter, and, when the mine was very wet, nearly 5,000 gallons of water per minute were discharged into the adit. The water under pressure was admitted under the piston only; cylindrical valves admitted a full flow for seven-eighths of the stroke only, and then commenced closing, while a small valve opened and allowed enough water to pass in to complete the stroke.—*Blake on Mining Machinery.*

### Management of Belts.

A leather belt in order to run smoothly, and with the best effect, should have but one laced joint; and in making this joint, the two ends should be cut at right angles with the sides. The holes will have less tendency to diminish the strength of the belt in the cross section if they are cut with an oval punch. The laces should not be crossed on the inside, and care must be taken to put them in evenly and of equal strength at the two edges of the belt.

In case rivets are employed, the heads should be left in on the inside surface of the belt so as to leave no obstructing points to come in contact with the pulley, the washers being placed on the outer surface. Waxed ends used in connecting heveled and lapped ends should also be carefully confined within the surface on the inside of the belt, as they will work mischief by wearing if allowed to project.

The more nearly an equal thickness and perfect straightness are secured in the belt throughout its whole length, the better it will perform its work. Dust, grease and lubricating oils should on no account be allowed to accumulate either on the belt or pulley. If the motion is to be very rapid, the belt should, if possible, be endless—that is, it should have none but permanent joints, and it is especially desirable that the density and dimensions should be uniform throughout, all unevenness of texture being carefully avoided. If properly treated, no appliance for the transmission of power possesses more valuable advantages than the belt—its simplicity, smoothness and facility of working being scarcely attainable by any other means; but it also

demand the most vigilant attention to maintain a good working condition and secure the greatest economy of power.—*Leftell's Mechanical News.*

### Grinding Wheat Without Millstones.

At a recent meeting in Edinburgh, of the British Association of Science, a paper was read by Mr. Thomas Carr, upon a new mill for grinding wheat. It is described as reducing wheat by percussion, while it is unsupported, and projected through the air. When the wheat passes through the machine, it is struck by a series of hars moving in opposite directions. These reduce the wheat so instantaneously to a state ready for holting, that no injurious heat is caused, and consequently the flour is of much superior quality to that obtained by the usual way of grinding, and also at a much less cost. An Edinburgh firm has one of these disintegrating flour mills in full operation, and the advantages in its favor over the millstones it supersedes, are pointed out in Mr. Carr's paper. It rarely needs repairing in comparison with other millstones; requires fewer men, and thus saves in wages; is free from loss by scorching, occupies less space, and requires less driving power; and in addition to all this, produces a superior quality of flour.

If people would use flour that is "holted" less,—in other words, if more of the constituent parts of the grain were left, as God intended they should be,—there would be comparatively nothing heard of that fashionable complaint, "dyspepsia." But many housewives will continue to judge of the nutritious quality of their bread by its whiteness, which is a false criterion, and apothecaries will continue to fatten on this blunder.

**NEW INDICATING INSTRUMENT.**—A new instrument for indicating the velocity of flowing liquids, and for measuring the speed of ships, called the rhysimeter, has been invented in England, and has attracted much attention among scientific men. The instrument, as described, is in principle like the well-known anemometer, by which one is able to measure the speed of hot air, flame and smoke, contaminated with dust or corrosive vapors, as met with in furnace flues and factory chimneys. Both in the anemometer and rhysimeter the impact force of the current, and also its tendency to induce a current parallel with itself, are measured and made to become indicators of the force and velocity of the stream. A still more important application of the instrument, however, is that of measuring the speed of ships. The indicator may be in the captain's cabin. It resembles in size and appearance a barometer. In it a column of mercury indicates continually the speed of the ship. The full effect of the velocity is imparted to the mercury, without any appreciable loss by friction or otherwise, so that the indicators must always be absolutely correct. The instrument may be made self-registering, showing on a dial the total number of knots the ship has run, and marking on a piece of paper the precise speed attained at all periods of the voyage. The practical value of such an invention is obvious.—*Iron Age.*

**A USEFUL ALLOY.**—A metal composition which may be cast on steel and iron and which will adhere thereto, is much needed, since it is in practice an advantage to unite steel or iron with brass by casting; the difficulty of uniting by screws, bolts or pins being thus saved. In most cases, however, the inequality of the expansion produced in the two metals by change of temperature prevents their lasting union, and it rarely happens that the superficial union is sufficiently close to be permanent. The following composition closes firmly around iron and steel without any danger of becoming loose. It consists of 3 parts of tin, 37½ parts of copper, and 7½ parts of zinc. Since the last metal is partly converted into vapor at a high temperature, the above proportions may be slightly increased.

A wire brush for scratching scale from large round hars during the rolling is in use at the Griswold mill, Troy. The brush is fastened to the rest bar on the discharging side of the rolls, and the bar passing through the wire is effectually cleaned or freed from all scale by the time it gets the usual number of passes through the finishing grove. It is said that a brush of this kind, same as frequently used at foundries for cleaning castings, properly arranged behind the rolls, is better than the trough of cinders sometimes used in steel mills, and which is placed behind the rolls in same position.

## SCIENTIFIC PROGRESS.

### The Triumph of Science.

Recent reports from the East give full particulars of the prediction by the weather Signal Bureau, at Washington, of the two terrible cyclones which were developed off the Florida coast about the middle of August last. These predictions are considered as striking and important triumphs of science in the direction indicated.

It appears that the fearful cyclone which developed itself near Savannah, on the evening of the 20th of August, was detected and pre-announced at thirty-five minutes past 7 o'clock on the morning of the 17th as then existing "between the Bahamas and Georgia." The announcement from the office of the chief signal officer took place nearly three entire days before the tropic-horn monster fell upon the Georgia coast in all its fury.

On the morning of the 18th the announced path of "the cyclone in Florida" was "to the north-west into Georgia, with easterly winds and rain," and later in the day this telegram was re-affirmed by the signal officer. On the 20th it was added at an early hour by telegraph, "The center of the cyclone will probably keep a short distance east of the immediate coast line, and he off Cape Hatteras to-morrow morning."

These storm warnings issued to all the harbors interested, between forty-eight and seventy-two hours in advance of the threatened hurricane, it seems by our latest reports, were verified by fatal punctuality. The correct predictions of the bureau saved a great many lives, and an immense amount of property. The damage by the storm in Savannah was estimated as not much less than \$100,000.

On the morning of the 24th a second cyclone, (the first had just died away,) was discovered and reported, which in forty-eight hours verified the predictions of the Signal Office in a fierce visitation of the South Atlantic coast. As predicted, its track lay "more to the west than that of the cyclone of the 18th inst." The full returns from Georgia and Tennessee show that it has been a serious and severe storm. Thus, in the space of a few days, we have had the strongest evidence of the wisdom and ability of our national storm signal system.

At the time of the occurrence of the above cyclones the West India and Panama cable had not been laid to the Islands of St. Lucia and Barbadoes, which are in the very center of the region where the cyclone was generated. Their wires are now in operation, and will on any similar future occasion greatly facilitate and hasten the making up of reports. Their further extension to Panama will still more increase the usefulness of the Bureau.

### Magnetic Wells.

Much has lately been said about certain wells in Michigan, the waters of which are said to contain most extraordinary magnetic properties. The controversy as to the magnetism contained in the water is not yet settled. Professor Winchel gave it as his opinion before the American Scientific Association, at their meeting in Troy last year, that the water was not magnetic, but in his late report to the Legislature, as State Geologist, he so far modified his views as to be in doubt on the subject. Prof. R. C. Kedsie, of the State Agricultural College, at Lansing, asserted that the magnetism was only in the iron tubing, and instanced as a proof of this, a pipe which he had inserted in the ground to the depth of thirty feet, and which had become magnetic. This, however, is no new principle. Every school boy knows that any bar of iron, placed upright, will, after a time become magnetic.

That the water is strongly magnetic was shown where a wooden pipe, ten feet long, was placed between two lengths of iron pipe. The iron tubing, which the water

reached after passing through the wood, was as strongly charged as the first piece.

Whether the magnetism is derived from the pipe or its rocky bed, is a matter of dispute. Experiment proves that it is in the water. Knives held in the stream or rubbed upon the pipes become magnets. The time required to magnetize them varies greatly. Knives have been charged in two minutes. Sometimes, of five knives suspended in a bath tub over night, four will become strongly magnetic, while the fifth will be unaffected. If a compass be held near the running water, or near the pipe, the needle is deflected, more in the latter than in the former case.

Another curious property of the water is its coloring power. Superintendent Crow will show the visitor into a room in which stand goblets, glasses, bottles, tin-cups, salt-cellars, and the like, all under a shower of magnetic water. Five days suffice to color these in turn to a beautiful amber, seeming to saturate the glasses with pale gold. This is caused by the deposit of iron, and gives table ware a handsome appearance. Some cheap jewelry company, if alchemically inclined, might transmute the baser metals into gorgeous jewelry, and reap unbounded harvests on the principle of the "one almighty dollar." The color seems to be imperishable, and is beautiful as it is lasting.

### The Brain of Insane Persons.

In a paper read before the late meeting of the British Association of Science, by Dr. T. B. Tuke, the doctor said:—It is generally acknowledged that the intellectual powers are manifested through the grey matter of the cerebrum, and as in insanity these faculties were impaired, exaggerated, or perverted, the author asserted a belief that, by examining the brains of the insane a hope existed of discovering a road for arriving at a solution of the functional difficulty. The time had passed when the term mental disease, insanity, or madness, conveyed to the minds of physicians, the idea that the mind or its faculties, were the entities which were the subject of disease. By a process of reasoning the pathologist had arrived at the conclusion that abnormal physical manifestations are dependent upon primary or secondary changes in the nerve tissue; that insanity is a *symptom* of disease, not a disease itself, and that the cause of the disease must be looked for in the brain. Six years ago the author commenced a systematic microscopic examination of the brains of the insane and with this most important result, that in every single instance a marked departure from healthy structure was observed. The process by which the brain matter was made fit for the microscope was related, also a list of twelve different parts of that organ which had in the majority of cases been examined.

After describing the various forms of disease, which were illustrated by diagrams and microscopic sections, the paper concluded with the following statements: We are not prepared to designate the individual part of the brain specially affected in the different forms of insanity; but we may say generally, that the *corpora striata* are the portions most frequently found affected, and that the cerebellum is the organ least frequently subjected to disease. Further, that the white matter is much more liable to evident structural morbid change than the cortical substance in comparatively recent cases, and that where the intellect has been in abeyance for prolonged periods, the structure of the grey matter of the cerebral convolutions is difficult of demonstration, the layers are found indistinct, as the cells are few in number and generally small in size. In the fifty-three cases of chronic insanity which we have examined, we have found distinct structural changes in the brain of each. This in itself is a fact having a most important bearing on the physiology of the brain, and one which, if followed up, may be reasonably expected to dissipate much of the mystery which hangs over the functions of its various parts.

**SODIUM AS AN EXPLOSIVE.**—Recent experiments by European scientists show, that in the explosion of sodium, the force exerted is by no means small, as may be inferred from the fact that if 46 grms. of sodium and 18 grms. of water be confined in just the space required for their bulk, the gasses generated by their contact will be equal to 450 atmospheres or 6,800 pounds to the square inch.

## CORRESPONDENCE.

## SCHELL CREEK MINES.

Eoe. PRESS:—The trip from Hamilton to this place I will not describe, for the road is the same as every one has seen who has had occasion to travel in Nevada—a succession of mountain ranges and sagebrush plains. After 12 hours' ride from Hamilton, a distance of 75 miles, we arrived at Schellburn, the principal camp of the Schell Creek miners, situated at the western base of the mountains. The extensive adobe buildings of the old Overland Stage Co. are in a state of partial decay, giving the place the appearance of some deserted Spanish town. Schellburn contains at present three boarding houses, two groceries, one lodging house and three saloons. The population of the district is about 250, scattered over 20 miles of country.

Owing to the great extent of the Schell Creek mineral belt it is somewhat difficult to describe its geological character except in detail. The whole western base of the range to within a short distance of the main mineral belt, is evidently of volcanic origin, and consists of various species of trappean and basaltic rocks sometimes occurring in dikes but more frequently in masses. In many cases there has been an overflow of the molten matter ejected from these fissures and openings; this is evident from the fact that in places where the basaltic covering is worn away, patches of the underlying porphyry are exposed. Very little upheaval of the surrounding strata has attended the eruption of these trappean rocks; a marked change however has taken place in the sedimentary rocks for a long distance from their front point of contact, no evidence of their former character remaining, except the stratification. Another marked feature of the district is the occurrence of Magnesian lime in contact with the richest portions of the main mineral belt, and its absence along the poorer part. In the northern part of the district this lime (evidently belonging to the Silurian age) rests on granite, but as we go south along the east side of the range we find a thick bed of quartzite underlying the lime, and finally the shales and schists of the Cambrian Series underlying the quartzite. Some fine-looking, well defined lodes have been found in these lower stratified rocks and the indications are good for valuable mines. The main mineral belt follows the crest of the range for a distance of from 18 to 20 miles and can be easily traced with but two intervening breaks for the entire distance, but the rich mineral portion is confined to three quite limited localities known as the Northern mines, situated to the north of the overland road, the Queen Spring mines three miles south of the road, and the Ruby Hill mines eight miles further south. For convenience I will describe each locality separately.

## Northern Mines.

The formation containing the ledges in this part of the district is dolomite, overlying granite. The strata are nearly horizontal having a slight dip to the east of only about 8 degrees. The tilting of the strata here is evidently caused by the upheaval of the volcanic rocks on the west side of the range. The dolomite as far as I could discover is entirely destitute of organic remains, if they ever existed, intense metamorphic action has evidently obliterated all traces of them. The shale, in places overlying the main belt, is said to contain a few fossils, and some specimens shown me evidently belonged to the orthids.

The McMahon mine is situated near the cañon on the west side of the main range and is very conveniently located for cheap working. The vein or deposit is about 12 feet in thickness and can be traced on the surface for some distance north of the works. One-half of the vein is supposed to be pay ore, some of which is quite rich. A few tons worked at the Big Smoky Mill, Hamilton, yielded \$360 per ton, but probably the average of the paying part of the vein would not exceed \$60 per ton. The vein is wholly in the dolomite. The ore is copper glance, sulphide of silver and horn-silver. About 300 yards northeast of the McMahon, near the summit, is situated the

## Summit Mine.

This is an immense mass of croppings about 600 feet in length by 50 feet in thickness. It lies on the dolomite with a thin bed of shale underlying quartzite above it,

and has every appearance of being a contact vein and in fact the same may be said of the whole main belt, but in this formation, appearances are too deceptive for one to hazard an opinion. Much of the ore is rich; one ton worked at the Big Smoky Mill yielded \$390 per ton, but the value of the mine consists in the quantity of low grade ore exposed in the croppings. The ore is mostly a free sulphide of silver distributed very evenly through a quartzose gangue.

## The Woodburn

is situated to the south of the summit and is supposed to be an extension of the last named mine. The vein is about six feet thick and traceable on the surface for 200 feet. Like the McMahon it lies wholly in the dolomite and carries the same character of mineral; it differs from the main belt in being more cupriferous. The ore is very evenly distributed through the ore and is of good grade. To the north of this a vein called the Midas was discovered, carrying considerable gold. It made quite a stir at the time and every boulder in the vicinity was located, but I have heard nothing of it lately. There are many other locations in this part of the district, some of them showing favorably, but there is nothing done towards their development and we can form no estimate of their importance.

## Queen Springs.

This portion of the district is separated from the northern, by a hill of porphyry  $2\frac{1}{2}$  miles in length. This porphyry is traversed by dikes and masses of greenstone, but so far as known is entirely destitute of mineral-bearing lodes.

South of this hill across Queen Spring Cañon the dolomite again makes its appearance on the east side of the range, and with it the mineral belt. The dolomite in this part of the district dips to the west at an angle of 30 degrees and forms the foot wall of the vein, the hanging or western wall being quartzite. The croppings here are very large, varying from 50 to 150 feet in thickness, and the rich mineral portion has a length of about one mile. Rich chimneys of ore come to the surface in a number of places along these croppings and each of them have been located as a separate ledge, consequently some of the titles must conflict. The

## El Capitan and Silver Chariot,

are located at the north end of this belt on one immense mass of croppings standing from 20 to 30 feet above the surface, and 600 in length, by 50 feet in thickness. The largest part of the outcrop is rather poor in mineral. The Silver Chariot, however, shows well in horn silver and has worked \$188 per ton at the Big Smoky mill. The

## Sweepstakes,

next south, has a good prospect for a large body of fair milling ore.

## The Nutmeg,

situated near the south end of this belt is one of the most promising mines in this part of the district, and the owners though poor men are showing their faith in the value of the property by doing all they can to aid its development.

## The San Francisco

is situated to the east in the dolomite and shows the same character of ore as the corresponding mines in the northern part of the district. South of Queen Spring Hill the dolomite gradually loses its magnesian character, and passes into a dark stratified lime resembling shale in appearance, and the accompanying quartz belt becomes gradually poor in silver, until near Ruby Hill, eight miles south of the last named mines the true dolomite again makes its appearance and with it rich masses of silver ore. In this part of the district a mass of eruptive granite has divided the ledge into two veins, or two branches of the same vein, for more than one mile in length; one branch follows the dolomite along the east side of the granite and the other the west side. On this last branch are located the most prominent mines in this part of the district consisting in part of the following locations: Cow and Calf, Silver Wreath, Rambler's Luck, Lookout, and Rattler's Joy. These mines are considered the best in the district, and the large masses of high grade ore exposed in the croppings fully warrants the opinion. It is only a few weeks since the first discoveries were made in this part of the district, consequently the owners have had but little time to devote to the development of their property; but there is as much good ore in sight at present as White Pine could show under like circumstances. The ore in these ledges contains in addition to free sulphides, horn silver and ruby silver. Assays run high into the thousands, and considerable of the ore on the dumps

will certainly work well into the hundreds. Taking it altogether this is one of the most extensive mineral belts in Eastern Nevada as well as one of the most promising, but capital is required for the development of the mines, as well as the erecting of mills for the reduction of the ore. This is not a poor man's country any more than other silver mining regions, and it is to be hoped that no one will be deluded into joining the great army of restless spirits already in this State, who appear to be doomed like the Wandering Jew to keep forever marching on.

A. J. Brown.

Schellburn, Sept. 13th, 1871.

## A VISIT TO TREASURE HILL.

(Continued.)

BY OUR OWN TRAVELER.

The Eberhardt and Aurora Company's Tramway, Hodgsons' patent, built last year is 11,000 feet in length. The elevator above sea level at the top is 9,150 feet, and at Eberhardt City, the lower end, 7,150 feet. A 16-horse power engine at that place furnishes the power for passing the wire rope around the drum, the buckets passing up one line and down the other. The steel wire is suspended on posts, the highest of which is 130½ feet and the lowest 20 feet. They are built of strong timbers 10 inches thick, and braced and framed together stoutly. There are five stations on the line having an angle of 35°. The total cost of this tramway was \$80,000.

Since it was built they have had some trouble with slack wire, and Mr. Thairwall, the Tramway Co.'s agent, came from England in order to make such alteration as was deemed necessary. It was found that the difference in the elevation (2,000 feet) between the upper and lower ends was the cause of the expansion and contraction of the wire; it being much warmer at Eberhardt City than up on the hill. The tightening pulley was taken from the hill and placed below where the slack was. The expansion in the whole wire 11,000 feet long, and one inch in diameter, was 60 feet. The buckets carry 200 pounds each at a trip, and the ore can be loaded at the mills below for a cost of from 75 cents to \$1 per ton. On one occasion 300 tons were carried down in 24 hours. The tramway runs down the Mahogany Cañon and over a very rough precipitous ravine, and some of the posts are being raised so as to keep it as much as possible on a level. It is the largest one, I believe, in the United States, and must prove a remunerative investment, as in summer it costs \$3 per ton, and in winter from \$5 to \$7 for hauling ore in wagons from the mines to mills below. The curves, either sharp or of a large radius, are easily passed and it answers the purposes of a railway without the necessity of embankments, tunnels or bridges. There are three lines of telegraph wire running up the hill which they use for sending messages, instead of signaling as formerly.

## Eberhardt City

is a small place with but few stores and houses. Through the kindness of the manager I paid a visit to one of the large mills here. There are two very large engines, respectively 150 and 125-horse power, to drive the stamps, pans, settlers, etc. The fly wheels are 18 feet in diameter. There are six large boilers to furnish steam for the engine and pans. The mill has 60 stamps, 22 pans, 11 settlers and 3 agitators, and the proprietors claim that they can work the ore up within 90 per cent. of fire assay. Forty men are employed. The arrangements are very complete for doing the work, the pulp being taken from the batteries to the pans in cars, and C. P. Stanford's patent self-feeders are used and said to give satisfaction. The engine, etc., was built by Booth & Co., of San Francisco. The mill generally, under the superintendence of Mr. Geo. Attwood, is one of the finest I have seen on this coast. The

## South Aurora Co.'s Mill

has 30 stamps, weighing 750 pounds each, 16 pans, 8 settlers, and 4 agitators; they also use the self-feeders, and crush from 50 to 60 tons per day. All the ore for both these mills is brought down on the tramway spoken of above. Near the City of Hamilton are the

## Rothschild's Smelting Works,

which cost \$60,000. There are three

large stacks 8 feet square. A 40-horse power engine and one of Root's patent blowers at these works. The building is a stone one, 180 feet long, and 30 wide. These works are now idle. They were built by J. A. Mattison, who started to build a refinery in connection but before it was finished his creditors in San Francisco attached the mill, although when completed the furnace was fired up and turned out 207 tons of bullion. Evarts & Co. have bought all the hills and should they not be redeemed shortly this splendid property will all belong to them. This would be a splendid investment to any parties wanting to look into it, and no doubt would pay well. The district, I have every reason to believe, can furnish a sufficient quantity of base ore to keep the works in operation. One great drawback to Mr. M.'s operations, was from the fact that the miners would not let him have ore without an advance, because they knew him to be involved.

## Hamilton City

is the great center of all the mining region hereabouts. The high rates of freight now retard the progress of the town materially. It has, however, a bright future before it, as developments show that Treasure Hill instead of being a delusion and a snare, is rich, and likely to be worked for years. The English in particular are investing freely in this section, and furthering the business of mining generally.

Woodruff & Ennor the well-known stage men own a fine ranch in Pine Valley, not far from the Palisades on the road here, and have cut 300 tons of hay this year. This stage company furnish daily all kinds of fruit from California, which is in demand. The Mormons formerly had all this trade but the enterprise of these gentlemen has taken it from their hands and given the benefit to our State. Leaving Treasure Hill, I paid a visit to

## Shermantown,

which is very dull at present, and but two mills are running. The Oasis owned by an English company, is running on Ward Beecher ore. It has 10 stamps, 10 pans, and works 15 tons of ore a day. They use one of Blake's crushers, and have on hand 300 tons of ore.

## The Metropolitan Mill

is running on tailings and it is said that it will be removed to Eureka shortly, as some of the owners have bought mining interests in that district. The town has declined in property and many of the inhabitants are moving to Eberhardt City on the opposite side of Treasure Hill. An English company have bought the pipes in the streets and will bring the water to the latter place.

Six months ago two Germans located a mine about 1½ miles north of the White Pine smelting works. They have exposed the ledge for 275 feet and taken out 150 tons of ore. It is considered a true fissure vein, and the ore is of ample value to ship to England. The vein is now five feet wide. An extension has been taken up and both locations are likely to prove valuable. I had not the time to visit as many of the mines in this section as I desired and intended, but your readers can learn of the general progress of such as interest them particularly by referring to the mining summary, on another page.

W. H. M.

(Our correspondent sends us a sketch of the ore chamber in the Eberhardt and Aurora company's mine but it is omitted for want of space.)

COMFORTS FOR WORKING HORSES.—A Western genius, prompted either by philanthropy or pelf, has patented a cover for draught horses, or those exposed to long travel that ought to throw into an ecstasy of delight the benevolent Bergh of anti-cruelty fame. He traveled 1,500 miles to New York, to dispose of his patent, and his team promenaded Broadway for the inspection of the curious or to catch a buyer for his patent.

The Turf, Field and Farm speaks of another patented head cover for horses, raised on a whalebone frame, with a revolving wheel, that, rotated by the movement of the horse, is supposed to add comfort to a hard working horse. If so, here is another simple plan that has novelty, if not decided utility, in its operation.

RESPECTING PROPERTY.—Baron Rothschild owns 144 houses in Paris, valued at \$5,750,000, in some of which, it is said, not so much as a pane of glass was broken during the siege.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALAMEDA COUNTY.

**COAL FOUND.**—Oakland *News* Sept. 20th: A very fine specimen of coal was found on Monday in a prospecting tunnel which had been run into a hill on Pierce's rancho, near San Leandro. The piece was small but of excellent quality.

### ALPINE COUNTY.

**ENCOURAGING.**—Alpine *Chronicle*, Sept. 23d: Mining operations in this county are progressing very favorably.

**MONITOR MINER**, Sept. 23d: Fine ore was struck this week in the extreme lower level of the Schenectady mine.

### AMADOR COUNTY.

**THE KEYSTONE.**—Jackson *Ledger*, Sept. 30th: They are taking out the 20 stamps erected last year, and placing firmer foundations under them, and also adding 20 more stamps.

**THE AMADOR MINE.**—This mine is in complete working order for the first time in 18 months. One year ago last April the main shaft was burned out, and the time until the present has been devoted to repairing the shaft and putting up new hoisting works. In place of the old bucket plan they have a "cage" on which iron cars, capable of holding 1,800 lbs. of quartz, are run.

**NEW QUARTZ MILL.**—The Original M. Co., at Amador City, are now erecting a 40-stamp mill which will be completed soon. They have opened a new shaft from the 200 ft. level intended for the main rock shaft. Their mine is looking fine, with an abundance of excellent quartz in sight.

**THE MAXON.**—This mine is located a short distance south of Amador City. The shaft has been sunk to a depth of 200 ft. with a drift of 80 ft., showing a good ledge of rock. Some of the rock crushed, pays very satisfactorily. They have several hundred tons now on the dump.

**IN THE POTOSI MINE.**—Amador *Dispatch*, Sept. 30th: They have lately struck a 7 ft. ledge of good rock, which prospects well.

### CALAVERAS COUNTY.

**QUARTZ.**—Calaveras *Chronicle*, Sept. 30th: Hoercher, Siegler & Key, owners of the "San Bruno" mine near Mosquito Gulch, have out a large quantity of rock in readiness for crushing.

The "Good Hope" mine in the same district will soon be tapped, 160 ft. below the surface; by means of a tunnel.

Work is progressing favorably at the Petticoat. The shaft is sinking rapidly.

**PRUSSIAN HILL.**—Sixty tons of ore taken from the shaft, crushed in Randolph's mill yielded \$2,263, averaging a fraction less than \$40 per ton.

### INYO COUNTY.

**GOLD DISCOVERED.**—Inyo *Independent*, Sept. 23d: Mr. Anderson a week or two since accidentally discovered a ledge of gold ore, on Big Pine creek. Other parties located what is probably an extension and, work is going on in two places. So far as developed, it is extraordinarily rich, about 4 ft. in width, and with every indication of permanency.

### LOS ANGELES COUNTY.

**BULLION.**—Los Angeles *News*, Sept. 30th: 295 bars of silver lead bullion were received at the depot yesterday from the Union works Cerro Gordo. Aggregate weight, 24,944 lbs.; on the 28th the receipts from the same place were 69,989 lbs.

**RICH ORE.**—D. Hardard's train, from Arizona, on Sunday brought 15 tons of ore from the Tiger ledge, Bradshaw dist., of surpassing richness.

**ORE.**—Another lot of rich ore from Ivan pah (Clark district) was brought to town yesterday.

### MARIPOSA COUNTY.

**MINING JOBS.**—Mariposa *Gazette*, Sept. 29th: One of the richest strikes ever made in "Hite's mine," was made two weeks ago. The amount taken goes away up into the thousands. When the tunnel, commenced several years since, is finished, which will probably be next summer, this will probably be the most valuable mining property in California. The Little Pocket vein of Aelkema & Hart, at Sebastopol is still yielding big boulders, rich in gold. The "Francis mine," is bonded to an eastern company for \$11,000. Neal, Sneider & Graham have been working on Buckeye and have taken out a large quantity of rock which they intend crushing at Neal's mill. Wilcox made a clean up

of the batteries in his mill on Buckeye last Wednesday.

### SAN DIEGO COUNTY.

**MINING PURCHASES.**—A one-half interest in the McMechan mill and the Redmen mine, at Julian City, San Diego county, has been recently purchased by A. W. Whiting, of this city.

**F. R. Wilson**, the inventor of the steam stamp mill, which bears that name has bought three mines in San Felipe cañon, and will commence the erection of a mill upon the property as soon as the machinery can be got upon the ground.

## Nevada.

### EUREKA DISTRICT.

**BULLION.**—Eureka *Sentinel*, Sept. 30th: The Phoenix is turning out 4 tons of bullion per day.

**STARTED UP.**—The Richmond furnace started up yesterday, after a 3 days' stoppage to re-line.

**STRIKE.**—A valuable body of ore has been struck in the Windsail shaft, on the N. W. corner of the Buckeye, at a depth of 130 ft., that assays \$300 in silver, and \$12 in gold, with very little lead. In the new drift from the main shaft of the Buckeye, at 170 ft., a large body of yellow carbonate ore, from 6 to 8 ft. in thickness across the bottom, has been struck.

**ANOTHER STRIKE.**—A rich body of ore has been discovered in the Adams & Farnen mine.

**STOPPED.**—The Monte Cristo mill has shut down for the purpose of making needed improvements.

**SALE.**—Carson *Register*, Sept. 27th: The Gaslight and Excelsior mines in N. Y. Cañon, have been sold to an English Co. for \$40,000.

### ELY DISTRICT.

**SALE.**—Pioche *Record*, Sept. 30th: On Thursday the negotiations pending for the sale of the Monitor claim, were concluded. It was sold to G. Hurst for \$13,000, and the money was paid over on Friday.

### HUMBOLDT.

**BULLION SHIPMENT.**—Unionville *Silver State*, Sept. 30th: The amount shipped from the Arizona mine, since our last issue, was \$8,442.

**GOOD YIELD.**—The Eclipse M. Co. have received returns of assays made at the Auburn mill, Reno, which yielded from \$80 to over \$400 per ton.

The Henning mine continues to yield ore of a high grade. An assay of ore has been made which gave over \$1,800 to the ton.

**THE NEW FURNACE.**—The furnace built by the Arizonian Ass'n, will be started up early the coming week.

**MARIETTA MINE—CENTRAL DIST.**—The mine is yielding ore of a high grade. The vein is narrow, but widens as progress is made into the hill; length of tunnel 30 ft. Assays give from \$700 to \$1,000 per ton. Silver predominates.

**A SPLENDID SUCCESS.**—The Batavia and Pacific M. Co.'s mill, Relief Dist., is proving a complete success.

**NEW DISCOVERY.**—Humboldt *Register*, Sept. 30th: A large, well-defined ledge of silver bearing ore has been discovered on the western slope of Winnemucca Mt. It is also reported that a rich copper vein has been found a few miles from town.

### REESE RIVER.

**HEAVY SHIPMENT.**—Austin *Reveille*, Sept. 26th: The Manhattan Co. shipped to Battle Mt. to-day, 123 bars of bullion, weighing 11,467 lbs., valued at \$95,458.65.

**MOREY OAR.**—6½ tons of second-class ore from the Ogden mine worked at the Manhattan mill, yielded an average pulp assay of \$384.50.

**OUTSIDE ORE.**—The Manhattan Mill Co. received 21 tons of second-class ore from the Monitor mine at Belmont to-day, which will work from \$400 to \$500 per ton. J. P. Courter sent in 4 tons of \$250 ore from San Antonio Dist.

**NEW MINES.**—Major McClellan, and others, owners of the Sabrook mine, cut two ledges of good size and fair ore while sinking the shaft on their mine. They have put up an engine.

**THE ESTHER MINE.**—J. Reynolds is erecting hoisting works. There is an incline down 200 ft. on the ledge.

**PRUIN AND PULLEN.**—Capt. Schenck and M. J. Cahaley, have set up a donkey on this mine, and are taking out a splendid class of ore. The ledge is 2½ ft. wide and looks splendidly.

On the 22d, an unsuccessful attempt was made to fire the Boston mill.

### WASHOE.

**SINKING A NEW SHAFT.**—Virginia *Enterprise*, Sept. 27th: The new shaft of the Caledonia M. Co., 600 ft. east of their present working shaft, was yesterday down 61 ft. A contract has been let to sink the

shaft to 500 ft. At this depth a drift will be run west to the lead and a level opened 100 ft. below the present lowest level. The 400 ft. level is looking and yielding exceedingly well. The ore breast at the south end is between 4 and 5 sets of timbers in width.

**NEW OVERMAN SHAFT.**—The shaft is down 115 ft.

**NEW OPIER SHAFT.**—The shaft is down 1,070 ft.

**CHOLLAR-POTOSI.**—The Chollar Co. are taking out a daily average of 70 tons of ore which assays from \$35 to \$37 per ton. A great deal of prospecting is being done at the present time.

**SUTRO TUNNEL.**—The tunnel is now in 2,435 ft.

**THE BELCHER MINE.**—We yesterday conversed with gentlemen who visited the mine a day or two since and took samples of ore from various parts of the huge deposits now being explored on the 1,100 ft. level, and the result of the assays made from these samples is truly astonishing. The assay of a quantity of ore taken from all parts of the face of the deposit, from both the east and west sides of the vein, and, in fact from every part of the vein, shows \$432 and some cents per ton.

### WHITE PINE.

**BULLION SHIPPED.**—W. P. *News*, Sept. 30th: W. F. & Co., shipped to N. Y. 4 bars of bullion, weighing 225 lbs., valued at \$4,193.08. Also, from the South Aurora S. M. Co., to N. Y. 3 bars bullion, weighing 176 lbs., valued at \$3,302.41. Total shipments for the week foot up the sum of \$88,745.83.

**EEBERHARDT.**—Working 14 men underground, and in open cut, which is looking well.

**WARD BEECHER.**—Hoisting by steam from Phillpott's shaft. Piling ore on dumps and shipping to mill.

**NORTH AURORA.**—The ore in Lady's chamber has not diminished in quantity. Hoisting from Ridsdale shaft. Ridsdale chamber of North Aurora improves daily. A good deal of the ore assays well up in the hundreds.

**BEECHER CONSOLIDATED.**—Sinking incline.

**ARGYLE.**—Looking fair.

**SOUTH AURORA.**—Good headway is made in the tunnel. Contractors are putting the 3 underground shafts down rapidly. Asorting ore on dumps and shipping to Stanford Hill.

**SOUTH ICEBERG.**—An improvement has taken place in the quality of the ore.

**GREAT WESTERN.**—Lower shaft down 80 ft. Indications show that the vein will be reached by running 10 or 12 ft. The upper shaft will be sunk by contract; 25 ft. from the present depth (50 ft.), the spar vein on which this shaft has been put down is now about 2 ft. wide, and good ore some 4 inches thick joins the spar. Worm will progress day and night.

**SILVER WEDGE.**—Improved in quality and body of ore.

**ASHBURY G. & S. M. TUNNEL.**—This tunnel starts into the mountain below the Eberhardt mine, in Keystone Cañon. The Co. expects to develop rich and extensive mines in the direction the tunnel is running within a distance of 400 ft. from the starting point. The tunnel is already in 200 ft. A contract has been let to push it ahead 200 ft. more. Also a contract to run two side drifts of 100 ft. each.

**NOONDAY.**—Rich ore has been struck during the week, that assays as high as \$1,000 to the ton. Its extent has not yet been determined, but it gives promise of being a large deposit.

**HEMLOCK.**—Mine looking well.

**GLAZIER.**—Running from Slauson shaft, at a depth of 43 ft. from the surface. Drift running in good ore, and favorable for a large body of ore after running about 20 ft. ahead.

**SILVER PLATE.**—A batch of ore was worked this week that yielded \$120.15 per ton.

**TRENCH.**—Taking out about 3 tons of \$385 ore per day. The Monte Cristo mill will start up on ore from this mine the beginning of the coming week.

**BALD EAGLE.**—General appearance of the mine is good.

**PHILADELPHIA.**—Sinking and down 90 ft. finding chloride and horn silver; ledge 3 ft. wide.

**CAROLINE.**—Shipping ore from this mine for the purpose of reduction, at the Big Smoky furnace.

**OUTSIDE DIST.**—SCHELL CREEK.—The mines for a distance of 24 miles, carry the same character of mineral—sulphuret ore predominating. In last report, it was said that a 5 stamp mill would be put up at Ruby Hill, at an early day. The mill is now on the way to the mines, and will be running inside of 60 days.

**ROBINSON DIST.**—Good ore holds out in the Osborne mine, in the 70 ft. level.

**MILLS—INTERNATIONAL.**—Running 60 stamps on ore from North Aurora and Ward Beecher mines.

**OASIS.**—Shut down on account of cam shaft breaking.

**SWANSEA.**—Running on custom rock.

**MANHATTAN.**—Running on Ward Beecher Consolidated. Crushing 30 tons per day.

**STANFORD.**—Running on South Aurora rock.

**BIG SMOKY.**—Running on Hidden Treasure and Company rock.

## Colorado.

**SHIPPED.**—Central *Herald*, Sept. 27: Palmer & Nichols shipped on Saturday a silver bar weighing 1,516 80-100 ozs., 852 fine. Coin value \$1,670 90-100. They ship a similar bar to-day and another of equal value Wednesday.

**GRAND ISLAND.**—Peawarmer lode, Cariboo, has been bonded for \$10,000, and 750 ft. of Hidden Treasure for a like sum. Parties are looking about the district with a view of purchasing mines.

**PELION.**—One thousand dollars per day for the last 40 days, has been obtained by sinking and running levels without stopping. The 3 shafts are 160, 120 and 80 feet respectively, and 4 levels have been driven.

**POTTER'S** two mills, Clayton's, the Philadelphia, and the stamps at Waterman's mill are running. The others have stopped for repairs, and one for lack of ore.

**Mr. Kline** has put up a whim on Hill & Co.'s claim, Fairfield lode, in Russell Dist. and is raising first-class ore.

**C. Bacon** has let the Mazeppa mine. This lead is paying well.

**MISSOURI** Cross lead is yielding smelting and mill ore. Shaft down 100 ft.

On the Kansas lead D. H. Andrews, at 100 ft., is gradually coming into pay. Southworth's claim is a big thing, and the new steam engine is now ready for hoisting. The Lyon claim is not paying as well as formerly, being pinched at the bottom of the shaft.

An Arey furnace is being erected by the Boston Co. at their works near Montezuma, for treating their silver ores.

At Gilson Gulch the Santa Fé lode is worked with profit. Gilson & Wright's has been yielding \$150 per ton in silver.

**CUTTER'S** reduction works at Dayton are progressing rapidly.

More lead mining is going on near Idaho than at any previous time. Fifty hands are employed in the Seaton, Queen, Crystal and Santa Fé mines. Womach & Deau are raising large quantities of rich silver quartz from the Seaton. The Crystal is developing into a first-class mine, and the Queen is proving very profitable. Negotiations for the purchase of the Seaton are going on in England.

**MEAD'S** mills on North Clear Creek, were stopped for repairs. Salisbury was running but a portion of his mill, while the Western Smelting works were stopped for machinery.

**KEARTING & Co's** furnace near Cariboo will be at work soon.

Some lode ore worked near Cockaday's ranch, Grand Island dist., assays from 40 to 120 oz of silver per ton.

Lake and Kimbers & Buffington's mills are running steadily. The latter has 32 stamps employed on California, 12 stamps on Gunnell, Kansas and other custom ores.

**Borum & Miller's** Empire mill is pounding away. Ten stamps are crushing Leavett ore yielding 5 oz. to the ton, but improving. The remaining 10 stamps are at work on Gregory Second quartz.

**T. Sanders** is running the Fitzpatrick mill at Black Hawk, on quartz from the Narragansett Co.'s claim No. 11 on the Gregory lode, but ready for custom crushing.

**Sanders, W. Robbins, and F. Kruse** are working the Narragansett and taking out ore from a depth of 100 ft.

**Cave & Mellor** are sinking on their claim of the Gregory Second. Lindsley & Co. have again resumed work, and Davis & Co. are also operating near by on this same lead.

**NEVADA.**—The Gunnell is extensively worked. Two engines, one whim and two windlasses are hoisting on the claims, and the rock raised seems to be of good quality, and to carry a fair percentage of first class ore.

The Sendenberg is turning out a good lot of mill ore. Below the Sendenberg, there is good looking mill ore being raised from the Prize.

Topping, on the Slaughter House, is raising considerable rock.

Active operations on the California have been suspended on account of negotiation with English parties desirous of purchasing this property.

**CLEAR CREEK CO.**—Cor. same, says: The

omery street, corner of Pine.

### California Chemical Paint Company.

TO THE CALIFORNIA CHEMICAL PAINT COMPANY, MANUFACTURERS OF D. R. AVERILL'S PATENT CHEMICAL PAINT.—*Gentlemen:* In compliance with your request I herewith submit for your consideration the following report of analyses of samples of D. R. Averill's Chemical Paint in its natural state, as manufactured by you in San Francisco, corner of 4th and Townsend Sts.; also report on samples of boards, painted with said patent paint, which you submitted for a series of comparative tests to be made with samples of boards painted by the best lead paints that could be procured in this city.

The comparative results of tests on these painted boards by the action of steam heat, sulphurous gases, alcohol, alkalis and acids prove that this Chemical Paint is *unrivalled*. The perusal of the following synopsis of its chemical nature and merits of composition as a paint will prove the above assertion, and that said paint must be considered a new and superior article. This testimony is also corroborated by the able reports on the subject by Professor C. F. Chandler, T. Lang Cassele, B. Hedrick and others to whom I am largely indebted and who unanimously consider the invention of D. R. Averill, one of the most valuable and scientific known to the arts.

It is true that any new invention or bold application of new principles will have its detractors, so it is in this instance; but the fallacious assertions that this paint is only a *mixture of benzine and water* is too tame for refutation. The reading of the following will convince the most skeptical that D. R. Averill's Chemical Composition as manufactured by you, possesses all the requirements and qualifications of the most perfect oil paints, and that its merits are superior to any other paints.

Use and Application of Water Glass or Silicate of Soda—Averill's Patent Chemical Paints.

Some twenty years ago Dr. Fuch, of Munich, discovered a method of painting which he called *stereochromy*.

The want of a vehicle more enduring than those formerly in use, and less liable to injure colors employed, led to this discovery. Dr. Fuch's method, which consists in the use of soluble silicates as the fixing material has been applied with considerable success in Europe, by German and French artists of distinction, in England by W. Herbert in the House of Parliament, and in the Fresco painting in the Capitol at Washington, U. S. The adoption of decorative and ornamental painting for the embellishment of public and private buildings has rendered necessary some changes in the older processes of painting, because the requirements are different. Outside and wall paintings are more exposed to destructive influences than that on panel and canvass. The wall itself is more absorbent; the accumulation of dirt, which has from time to time to be removed; the impossibility of giving the same care to its preservation as to objects of smaller size which are movable—render the employment of a different method of painting necessary; and one which will leave it in such a state, that it may, so to speak, take care of itself, and be independent of any further attention.

Silicate or silicious painting seems to supply all that is wanted for *beauty and stability*. It makes the surface of the wall almost impervious to moisture; it fixes the colors firmly to the ground and is easy of application. But the process discovered by Dr. Fuch seems incomplete and open to some grave objections, although the principle on which it rests is sound. The above remarks are not intended to disparage Dr. Fuch's discovery which is in truth one of the most important to art ever made. To this modest and great man all who are interested in the advancement of art owe a deep debt of gratitude for his persevering labors; pursued for many years amidst much discouragement and many difficulties. Those who read his treatise on *stereochromy* cannot but feel delighted with the earnestness and singleness of purpose with which he labored to attain the high end which he set before him. He thus concludes the account of his investigations:—"But before all, I thank God, who graciously allowed his weak and aged servant to finish the preceding investigations so far, that others may build upon the foundation that I have laid." He evidently saw that much remained to be done to perfect the process which he had originated. The honor to have brought this invention to perfection belongs therefore to D. R. Averill,

who, if he has not found the philosopher's stone, has at least produced a *paint* worthy of a philosopher, and which promises to become the paint of the age. Although five years are not five centuries, chemistry has analyzed even the tooth of time, and can produce within the period of a comparatively brief experiment, results identical with those of the ages of atmospheric corrosion and disintegration.

Samples of Averill's Chemical Paint, have been boiled, heated, frozen and pickled in alkalis and acids; and fumigated with foul gases. It has been boiled and then immediately placed on ice so as to freeze whatever water might have been absorbed, and it has also been heated and then plunged into ice water, but without any sign of cracking or softening, superficially or otherwise. No other paint could stand these tests. The *durability* of Averill's Chemical Paint does not rest alone upon such evidence as this, for it is of the simplest chemical composition. Chemistry testifies to the durability, if not the indestructibility of a material which is *nearly silica*, like flint, and is consequently, unalterable in air; and as this new paint is almost impermeable, it will suffer little if any injury from moisture or frost. We may then, as the lawyers say, "admit" the durability, and if further evidences are necessary, the many applications of this paint made in this State during the last two years is sufficient to show that it is a true and permanent paint for either outside or inside application. Previous to Averill's invention paints were only mechanical mixtures consisting of:

1. *Pigments*—Such as carbonate of lead; oxide of zinc; lamp-black; ochres, raw or burnt, etc., purchased by the painter from the manufacturer. These pigments are generally dry or ground with a small quantity of linseed oil.

2. *Oils*—Generally boiled linseed or poppy oil.

3. *Diluting or Thinning Agent*—Spirits of turpentine, which has been replaced within a few years to a greater or less extent by benzine, a light naphtha derived from petroleum.

4. *Varnishes*—To give a gloss, copal resin or shellac dissolved in turpentine, linseed oil, benzine, alcohol or a mixture of some of them.

5. *Driers or Siccatives*—Metallic oxides or salts either previously boiled in the oil or added by the painter in mixing.

The disadvantage of paints prepared as above described are:

1. That in the ordinary oil paint formed by the grinding of metallic oxides or carbonates, there is no substantial union between the oil and the metallic pigments employed.

2. Paint thus prepared would not keep, it must be used at once; any portion which might be left over would spoil in a few days, the heavy pigment settling to the bottom of the vessel and becoming more or less hard, while the oil becomes thick and soapy or stringy in its consistency. After paint has passed to this condition, it is no longer possible, even by the process of grinding, to reduce it to a uniform and smooth consistency.

3. Ordinary oil paint, when exposed to the action of the atmosphere, after a certain time the pigment becomes loose or detached from the oil, rendering the surface chalky, especially when the pigments contain a large proportion of *barytes*, which, properly speaking, forms no union with the oil.

The Averill Chemical Paint, although an oil paint, is not liable to these objections; it can be prepared ready for use in large quantities at the manufactory, sent to any distance or kept any length of time, without change. Put up in barrels or other convenient packages it may be drawn from time to time for use in convenient quantities and such portion as may not be consumed may be returned to the package for future use. Any person who can handle a brush becomes a painter for the time being:—"Why?"

Because the Averill Chemical Paint is in a permanent *liquid* form, a result obtained by the use of the following chemicals: acetate of lead; sulphate of zinc; hydrate of calcium, and silicate of soda, in addition to the pigments, oxide of zinc, the oleaginous substance, boiled linseed oil, and the thinning or diluting agent, benzine, manufactured especially for this paint, and which cannot be replaced by the ordinary benzine now in common use which destroys rather than benefits any paint. The combination of these chemicals are:—

1. Their action upon the oil, producing with it an "emulsion" or intimate mixture of oil and water solution from which the oil cannot separate on standing, and from which the pigment cannot separate as sediment.

The alkaline constituents in this paint, viz.: hydrated calcium, and silica of soda, are not present in sufficient quantity or of the proper concentration to effect a true saponification of the oil, as by analysis the oil is recovered *unchanged* which could not be the fact had it been subjected to saponification.

2. The action of these chemicals upon each other produces more or less of a gelatinous substance which, added to the viscosity of the oleaginous mixture and its peculiar combination, renders the mass homogenous and uniform in consistency, and chemical and mechanical effect. The compound paint resulting in a body so uniform and permanent, that practically, there is no separation possible in its constituent ingredients.

3. The effect of soluble silicate of soda (water glass) in this paint, made of boiled linseed oil and metallic salts of lead and zinc (acetate of zinc and sulphate of lead,) is to render the paint, as already stated, more viscid or glutinous, a property so important as to prevent the separation of the solid parts of the paint, which happens with paints mixed in the old way.

4. The value of this paint, aside from its *permanency of liquid*, consists in its affording a means of protection to wood and other surfaces against the action of the elements.

5. By the presence of a gelatinous silica and the alkaline ingredients, combined with the oil, this paint forms as has been proved by experience, a coating comparatively fireproof.

6. It is also remarkable for its elasticity, possessing the important and peculiar advantage of not breaking up into chip cracks, consequent upon the oxidation of the oil; its surface therefore remains smooth and uniform after long exposure. The brilliant gloss or polish, due to the manner of its composition, is another feature over ordinary oil paint, in which a gloss can only be obtained through damar or other resinous varnish.

7. It seems strange that year after year persons should go on painting their residences with a material like white lead, which every one knows changes color from the action of sulphur gases which are always present in the atmosphere; whereas the basis of Averill's paint being zinc, there is no liability of discoloration by these gases. It is free from the poisonous effect of lead paint (painter's colic), and by virtue of the peculiarity of its constitution it can be washed with soap or alkaline water with a freedom which would be destructive to ordinary oil paints.

8. The value is not dependent wholly, as in the case of oil paints, upon its hardening on exposure to the atmosphere by the evaporation of its volatile constituents, and the solidification of the oil under the influence of the atmosphere; but it is already in such a condition of firm chemical and mechanical union, that when a surface freshly covered therewith is drenched immediately after it is put on, by a shower of rain, it is not washed or furrowed by the water as is the case with ordinary oil paint.

9. The universal adaptability makes it the most perfect substance known, and this invention is one of the most valuable and scientific known to the arts.

Although the use of soluble water glass in painting was quite suggestive in its new application, still a proper combination was required to avoid the quick drying which results when oxide of zinc is ground with silicate of soda, due also to the etate of concentration of said solution of water glass, which is a matter of considerable importance in this paint. In its practical application, it required a combination of oil with other ingredients to form not a mere mechanical mixture; which, on standing for more or less time would separate, and on being applied to wood, metals, or stone would fade or chalk off. Such a combination as to obtain a product meeting all the requirements of a perfect paint; durability, readiness of application, universal adaptability, retention of colors, special qualification of covering and easy to spread, perfect adhesiveness, resistance to water, and preservation of wood and stone, was the aim of the inventor. It has proven a real commercial article which will, from its chemical nature, prove more durable than oil paints. It does not blacken by exposure to sulphurous vapors, dries quickly, resists dampness and the action of water, can be cleansed with boiling water and soap, and preserves the wood from decay rendering it at the same time *incombustible* instead of increasing the danger from fire as is the case with oil paints. I am confident of its ultimately superseding the use of all other paints for external or internal application either on stone, wood or metals.

L. LANSZWEERT, Analytical Chemist.

### The "Challenge" Feed Mill.

Feed that is ground is always more beneficial to animals than that which is fed whole, and it is said that at least 33 per cent. is gained by using the former. Grain gathered after it has become ripe and all the moisture has ceased to circulate, then allowed to become further hardened and dried by age, cannot but be benefited by some grinding process which softens and renders it easy of mastication. No wonder horses teeth wear out since they are forced to uses which will wear down the hardness of stone. They were only intended to crush the juicy herbage of the field.

Any apparatus which will secure all the nutritious properties of the grain, and at the same time render it easy of mastication, is to be desired. The Challenge mill is specially adapted for this purpose, as well as for grinding other materials. The manufactory of these mills is at Batavia, Ill., and four sizes are made. There are three varieties of what is called the medium mill, costing respectively, \$75, \$85, and \$90. The grinding capacity and finish of these mills are the same; the difference in price does not indicate superior quality, but is caused merely by the style of the working gear. The Warehouse mill is capable of grinding feed in large quantities and the

The "Challenge" Feed Mill.

humidity of the grain makes no difference.

By the use of these machines the farmer is independent of the mill, being able to grind his feed at home with such power as he can command, either horse, wind, water or steam. By the use of a sieve all the meal required for family use can also be ground. Their portability and compactness render them unusually convenient, and the capacity is very large in proportion to the size. The principal advantage of these mills, over any similar appliances, are: cheapness of operation; no heating of grain; amount ground with one set of grindere; facility of adjustment to any kind of power; simplicity of construction, and cheapness in cost. They are adapted to grinding malt, rice, salt, flax-seed, sugar, pepper, spices, ginger, and roots of all kinds. The company guarantee that if adjusted to a one-horse power, any of these mills will grind five bushels of grain per hour, and five more bushels for each additional horse power up to four. They also manufacture power mills for breaking, cleaning and grinding cotton seed; hand mills for family use, and hand and tread powers of all capacities. The accompanying engraving is a representation of the Warehouse mill. These mills are for sale by Hawley & Co., corner California and Battery streets, and dealers generally, here and throughout the country.

**MISSING PEOPLE.**—Whenever an unknown corpse is exhibited for identification at the morgue, in New York, the very great number of persons who call to ascertain if it be the one missing from their own home, or circle, reveals a state of fearful insecurity. It makes clear the fact, that, at all times, in that city, there are hundreds of missing people, victims to accident, to their own or to the sins of others.

How many every day mourn some lost one, and though tortured by the mysterious absence, yet grieve in silence, fearful of what a revelation of its cause might disclose. The fate of how many victims never come to light, deep buried beneath the sod, or anchored to the bottom of the deep.

Accidents, violence, treachery, the dread of exposure and of shame, all these causes conspire to swell the number of the missing.

Useful Information.

All Metals Yield Pigments of Some Kind.

Mercury produces vermilion. Venetian red, mars orange, and yellow and Indian red are produced from iron. Copper gives us emerald green and verdigris. Chromium affords oxide of chromium and chrome yellow. King's yellow and orpiment are made from arsenic. Cobalt blue and smalt from the metal cobalt. Zinc supplies zinc white. Lead supplies white lead, Kren's white flake white, china white, patent yellow, red lead and orange mineral.

Among the colors extracted from animal matter, those distinguished by the brilliant hues imparted through the agency of Prussic acid, are most remarkable. This peculiar acid is produced by the calcination of dried blood, and the hoofs and horny parts of animals, and, in conjunction with iron, affords those beautiful and powerful blues known as Prussian and Antwerp blue. Gall stone and Indian yellow are the products of animal economy, and the cochineal insect, by a particular treatment and great delicacy in manipulation, is made to yield the most powerful and beautiful crimson known, namely: the carmine and the crimson lakes. Scarlet and purple lakes are also made from the same by varying the mode of manufacture.

Vegetable colors, from the want of permanency, are mostly rejected by the color maker. Among the few that are retained, the madder root holds the most conspicuous place. The indigo plant and gamboge also afford useful colors in the fine arts. Among the vegetable colors we must class Frankfort black, and that most important pigment, lamp black.

From this brief review, it would seem that all the kingdom of the material world and all quarters of the globe, are laid under contribution to supply to the painter his stock of colors.

**THE BLOODHOUND**—Is not a very interesting or valuable species of canines. Its origin was probably the Talbot hound—produced by selection and care in breeding. The bloodhound is tall, strong—but if pure, never exceeds twenty-eight inches in height at the shoulder; ears long and pendulous; color, if pure, tan, or black and tan; any white indicates impurity; jaw deep; air majestic and solemn; vertex of the head protuberant, and the protuberance indicates high breeding.

Richardson says that this hound does not injure the object of his pursuit but traces him to his hiding place, and then by his loud baying indicates his position. Wonderful stories are told of the acuteness of his scent, even when the object of search has entered the town and traversed streets that hundreds of other persons have more recently trodden; and it is asserted that the only means of escaping his unerring scent is by crossing water or spilling blood on the track. The latter practice destroys the discriminating fineness of the scent. We have also heard persons who have tried it assert that smearing the shoes with onion juice also distracted them.

**TO MAKE COURT PLASTER**—Soak isinglass in a little warm water forty-four hours; then evaporate nearly all the water by a gentle heat, dissolve the residue in a little proof spirits of wine, and strain the whole through a piece of open linen. The strained mass should be a stiff jelly when cool. Now, extend a piece of silk on a wooden frame and fix it tight with tacks and packthread. Melt the jelly, and apply it to the silk thinly and evenly with a hair brush. A second coating must be applied when the first has dried. When both are dry, cover the whole surface with two or three coatings of Balsam of Peru, applied in the same way. Plaster thus made is very pliable, and never breaks.

**CULTIVATING SPONGES**—The French and Austrian governments have begun to raise sponges artificially; the former on the shores of the Mediterranean, and the latter on the coast of Dalmatia and the cultivation said to be perfectly successful and very profitable.

It has recently been discovered in France that splendid blotting and wound-dressing paper can be manufactured out of sponge. The sponge is reduced to an impalpable pulp by grinding, and is then made into paper by the usual process. The discovery is secured by a patent, and will prove valuable, as the paper thus made is indispensable in dressing wounds.

Good Health.

Wearing Glasses.

Some physicians have advised that people should never put on glasses for reading or writing, but continue persistently to read and write without them, by which, it is claimed, by such advisers, the eye will regain its former power.

The fact is that the eyes of some are probably susceptible to such a change—a renewal, or as it is sometimes called a “second sight”—but it is only the empiric who is absolute and final in his decision. The legitimate, thinking professional makes experiments and arrives carefully and cautiously at results, which he finds vary with different constitutions and diverse physical developments.

In the use and non-use of glasses, much depends upon the individual case. Experience teaches that what will help one will not help another under precisely similar circumstances.

Studious habits, overwork, greatly taxing the eyes to perform severe and continuous duties, are common causes of their early failing. The introduction of the art of printing and the general habit of much reading is doing considerable toward a general increase of weak eyes, over what formerly existed; but the idea of relying on time, as a general thing, for its restoration, is utterly inadmissible, in view of the numerous careful experiments which have been made.

**ASTHMA INCURABLE**—Asthma is an incurable disease by human agencies. An attack can be modified or shortened, and this is all that the thousand and one vaunted remedies for the “cure” of asthma can do; they alleviate or remove for the time, nothing more. Sometimes the disease lies dormant for months or years, only to re-appear in some change of life, or more terrible form of human affliction. In some cases it disappears in childhood, to show itself again after forty years. Children sometimes “outgrow it.” If it disappears at the “change of life,” it may not be heard of again, but that life will seldom reach three-score and ten.

It is very certain that persons troubled with asthma may be exempt from it for a succession of years, and even for life, by removing to a different atmosphere or a different climate; hence, instead of losing time in the attempt to “cure” asthma, or of being satisfied with shortening or curing merely an attack of it, it would be a wiser course to change localities or climate.

**BLEEDING FROM THE NOSE**—“What is the cause of bleeding at the nose? How can it be prevented or stopped?”

This occurs most frequently about the period of puberty, when there is usually a greater tendency to plethora than at other times. It can be prevented by keeping the depurating organs, the skin, bowels, and kidneys, in an active condition, by plenty of exercise, and by guarding against eating more than the system requires. It can usually be stopped by bathing the nose in cold water, and snuffing cold water up the nostrils. Care should be taken to keep the head well elevated. In connection with this, a hot foot bath is useful. In severe cases, the nostrils may be plugged with lint, or a soft sponge. When the hemorrhage is from the front part of the nasal passages, firm pressure with the thumb and finger will generally stop the flow.—*Heath and Home.*

SUNKEN CHEEKS—WHAT CAUSES THEM?

There are many causes which tend to produce hollow, wasted and sunken cheeks, the chief of which is dyspepsia, or any form of disturbance of the digestive organs. The use of tobacco is among the most fertile causes of dyspepsia. The too free use of pepper and other spices, vinegar, greasy food, sugar in excess, greatly damage digestion and make the skin dry and leathery, the face angular and the cheeks sunken.

DEATH FROM THE STING OF A HORNET.

A woman died in Algonquin, Ill., recently, from the effect of a sting from a black-and-white hornet.

Fruit at the State Fair.

An old pioneer at our State Fairs, Mr. D. L. Perkins, of Emmaton, Sherman Island, gives us the following brief notice of the fruit department at the late exhibition.

Eastern Fruits.

Your servant being one of the committee in this department, submits the following: In passing our judgment upon the fruit that was exhibited from the East, I find that from my notes that

The Pears

differed a great deal both in size and flavor from the different localities. Take for instance, the Swans Orange, in seven different States there was scarcely a difference; they were uniformly good, while scarcely any two out of other varieties were alike. The finest pears were those from New York. Taking into consideration the fruit of this class grown in California and the East, the fruit is far superior here in size and flavor, though allowances should be made for the locality, and the time of gathering them to be exhibited here.

Apples.

The finest display of this class of fruit came from Nebraska and Kansas. From the first named State the exhibit was very fine, the fruit was unusually large and highly colored. This collection was admired by every one that had the pleasure of seeing it. As regards the exhibit from other States, they were small and grown in a colder locality.

Corn.

Some very fine specimens of Dent corn were exhibited by several of the Western States.

Fruits.

I am sorry that I am compelled to remark that a large portion of the fruit, that came from the East was decreased. It is unfortunate because in this State we are entirely free from any of those insects but care has been taken to have all the fruit, that was left after the Fair destroyed. Great credit is due to our eastern friends, in sending the fruit, as persons could thus judge of the difference between the East and the far West.

Our Own Fruit Exhibit.

Perhaps at no time since the organization of the State Agricultural Society has there been so large and choice a display of fruit as has just taken place in this State, and that too of such a fine quality. There being but few premiums, the contest was very close. The large collection from Mr. J. R. Nickerson, of Lincoln, surpassed all of his former displays, embracing some 400 varieties of all kinds of fruits and vines. Mr. Shaw of Sonoma, Brumlor of Placerville, Carpenter of Diamond Springs, Garrett of Placerville, with many others, deserve especial notice for their fine displays.

The Display of Grapes

was the finest that I have ever seen in the State, and embraced many new and choice varieties. This branch of the fruit exhibition, seemed to be highly appreciated by our eastern visitors. Taking the entire exhibition this year, with the fruit, it far excelled all which have preceded.

I shall have about 50 varieties of the choicest fruit, cast in wax by a competent person, to be placed on exhibition at the next State Fair, so that we may see if any improvements are being made.

Wines.

The display this year was the largest made by fruit-growers that I have ever seen, and much of it was of a very fair quality; there was also much competition and all parties seemed well pleased with their awards.

In Conclusion

I will say that during the 15 years past, that I have been connected with fairs, I must say that I have never seen one so well conducted as this has been. The Board of Managers as well as the different clerks all seemed to do all that they could to make the contributors at home. Not a jar or a word of ill feeling did I hear or see, and when the awards were announced all seemed to be well pleased with the result.

THERE are fourteen Americans studying at the University of Leipsic, and sixty-three at Berlin.

The Harvest is Over.

The gathering of the crops is about over, and the farmers are in the midst of the harvest holidays. Stock-growers are trotting out their best cattle, colts, sheep, pigs and poultry. How sleek they look, notwithstanding the dry season and the parched and unsightly appearance of the country! Improved mowers, reapers, threshers, plows; big pumpkins, squashes, potatoes, beets, and the very best of all other kinds of farm produce, are sent to the various fairs for exhibition. How much everything is admired by the throngs of men, women and children who go to the “show,” and what crowds of people go there!

Paradoxical as it may seem, it is nevertheless true, so far, that though we have had a season of unusual depression, in every department of business, there never has been a year of such great success in our usual fall exhibitions. The show has been unusually fine, the attendance has been large, and the receipts have exceeded all former occasions—all of which is truly gratifying and indicative of the indomitable perseverance of our people, who are never discouraged at temporal hindrances, but rather make them the occasion of putting forth unwonted energy and determination. Such a people can never fail. It is just such that are needed to build up new empires of business and of thought.

Well, after so much hard work it is but meet and proper that our farmers should have a “play-spell”—a short period of rest, of enjoyment, and of recreation and observation. It always does people good to come together and compare notes and cultivate the social relations. It is by just such exhibitions as we are now enjoying, all through the country, that each individual of twenty or a hundred, engaged in the same pursuit, may possess himself of what the others have gained during the past year. It is not simply that one may learn of another; but that each may learn of all. Such gatherings will do us all good, and in a thousand ways. Would that they could be made even more general than they are. Intelligence would thereby much more increase, and mankind make better progress. Does the world shine on a better, happier or more intelligent or progressive people than are to be found on this Pacific Coast? If so, where?

**NITRO-GLYCERINE** does not seem to become any more civilized as it mixes in scientific society. We read, in a German publication, an extraordinary account of the explosion of only ten drops of this substance, which a pupil in a laboratory had put in a cast iron saucepan, and heated with a Bunsen gas flame. The effect of this explosion was that the forty-six panes of glass of the windows of the laboratory were smashed to atoms, the saucepan was hurled through a brick wall, the stout iron stand on which the vessel had been placed was partly split, partly spirally twisted, and the tube of the Bunsen burner was split and flattened outward. Fortunately none of the three persons present in the laboratory at the time were hurt. When nitro-glycerine is caused to fall drop by drop on a thoroughly red-hot iron plate, it burns off as gunpowder would do under the same conditions; but if the iron be not red-hot, but yet hot enough to cause the nitro-glycerine to boil suddenly, an explosion takes place.—*Scientific American.*

A new invention consisting of a machine combining the advantages of an alarm pump, fire engine and ship's pump, was recently tested at Dover, N. H., and is said to have given great satisfaction to a number of interested gentlemen present at the trial. The signals are made by means of a whistle, blown by compressed air in the pump, and this whistle, under ordinary circumstances, can be heard three miles. The signals for fog, pilot, distress, for course, etc., consist of long, medium and short blasts, according to the key furnished, and by a similar process a telegraphic alphabet can be used for communication. By changing the action of the machine, water may be pumped from the ship, or into the ship to extinguish fire. The entire apparatus is in very small compass, is very simple, and with all its arrangements cost but \$150.

### Notices to Correspondents.

A. E. M. writes as follows: Suppose a gun he charged with 2 ozs. of shot and sufficient powder to give a recoil equal to 80 lbs.; then vent the piece and charge with same quantity of shot, adding enough powder to give the same recoil as before vented; which will give the deepest penetration before or after venting?

Our opinion is that there will be no appreciable difference in the penetration, as far as the vent is concerned, for the reason that it is only put into guns in order to render them more easy to load by permitting the condensed air to escape. Such was the old idea, but no guns are made with vents at the present day, although in some of Westley Richard's guns there is an artificial one which does not pass through the breech as it appears to. As to "adding enough powder to give the same recoil" we would say that the recoil does not depend so much on the amount of powder as on the amount of shot. The reason of this is, that the powder has to overcome the *vis inertiae* of the shot, and the more shot there is, and the tighter it is rammed, the more the gun will "kick," as every sportsman knows.

NEW SILVER DISCOVERIES are reported near the South fork of King's river, about fifty miles north-east of Visalia and near the base of Mount Whitney. According to the *Bakersfield Courier*, the beds are large and well located for mining operations. The discovery was made by a party of prospectors from Visalia, who brought back rich specimens of silver ore as evidence of the value of their discoveries.

GRAPES, for wine-making, are selling this year, in Los Angeles, at one dollar per hundred pounds; against seventy-five cents last year.

## ON THE ASSAY OF GOLD.

BY HENRY G. HANKS.

[Expressly for the Press.—Continued.]

The weight of the button being carefully noted, pure silver is added and it is again cupelled. It has been found that the silver cannot be dissolved out of an alloy of that metal with gold, unless the proportion of silver is at least 2½ times that of the gold. If a larger proportion is used, the gold is left in the form of a powder, and cannot be dried and weighed without danger of mechanical loss. If less is employed, the gold protects the silver, and the action of the acid ceases, while some of the silver remains undissolved. An alloy of 3 parts of silver to one of the gold was formerly taken, from which the common term quartation comes, but of late years the above proportions have been found to be best.

As the button resulting from the first cupellation may contain silver, it will be necessary to ascertain if such is the fact, and if so, in what quantity it may be present.

A preliminary assay is easily made by means of the touch needles as described in a former article. When great accuracy is required—as in case of many assays of gold from the same mine,—half a gramme may be cupelled with 5 or 6 parts of silver and the proper quantity of lead, the resulting button rolled out and boiled in nitric acid, as will be fully described hereafter. With the data so obtained it will be easy to make up the proper alloy, for the actual assay. By this method the gold will be obtained as a powder, but the results will be sufficiently accurate for a preliminary assay. For all practical purposes the test needles will give results sufficiently exact, and may be confidently used after a little practice.

An example will fully explain the manner of making up the alloy.

The button is found to weigh 972 one-thousandths of the unit, according to the weights used, and by preliminary assay the gold 896 fine. Which as before explained is 896 thousandths, it is evident that there are 896 of gold and 76 silver in the alloy, very nearly. If these results were accurate there would be no use of proceeding any further, but the results are only sufficiently so to ensure a good alloy for the continuation of the assay. Multiply the gold by 2.5 which will give the silver required to be added to the gold  $896 \times 2.5 = 2,240$ , but there is already 076 parts of silver with the gold, which must be subtracted, therefore 2,164 is the amount of silver to be added to the button  $896 \times 2.5 - 76 = 2,164$ .

The silver used need not necessarily be chemically pure, but it must contain no trace of gold. It is convenient to roll it out in thin strips to be cut with scissors as required.

When the proper amount of silver is weighed out it is to be folded in lead foil with the gold button and cupelled as before.

Two of the gold buttons which weighed alike in the first cupellation must be alloyed with silver and treated as above. It is not absolutely necessary to cupel the alloy the second time but it is convenient to do so while the muffle is hot, and it issues a malleable button which can be rolled out without breaking, and there is more certainty in unskillful hands of perfect fusion, and consequently, perfect mixture of the two metals, which must be the case to obtain perfect results. But the gold and silver may be melted together in a cavity in a piece of charcoal by a person skilled in the use of the blowpipe, with the same certainty of success, as when the muffle is employed.

The buttons resulting from the second cupellation are removed from the cupel, hammered slightly on the edges, to remove the bone ash, and afterwards flattened on an anvil by blows from a small hammer, the last blow being given near one edge to make that part thinner to facilitate the rolling process which follows.

At this stage, before rolling out the alloy they should be annealed; which can be done in the muffle if still hot, or upon charcoal with the flame of a spirit lamp, urged with a blow pipe. They are then rolled out into ribbons about three or four inches long, and then rolled up into a spiral form upon a glass rod or lead pencil. A slight pinch after this rod is removed will prevent their unrolling. They are then ready for treatment with acid.

The cornets are next placed in clean flasks and covered with about a fluid ounce

of the 20° nitric acid, placed on the sand bath which acts as cover of the furnace as before described, or on a small sand bath supported on the ring of a retort-stand over a spirit lamp, and boiled until no more red flames are evolved. A folded piece of paper or a pair of wooden tongs are used to lift the flasks and to pour the acid carefully into some convenient vessel kept to receive it, as the silver is valuable and may be recovered when a quantity has accumulated. The same quantity of 30° acid is then poured into each flask and being placed on the sand bath, again boiled; a small piece of charcoal which must not contain chlorine, is put into each flask to prevent bumping. After five minutes boiling the acid is poured off and each flask is filled up with distilled water, which is carefully rejected and the flasks again filled with the distilled water, this time quite full to the brim. Over the mouth of each flask a dry cup is placed, mouth downward like a cap, and the flask and dry cup inverted together. The cornet falls gently and without breaking to the bottom of the cup; the flask is then gently raised until on a level with the edge of the cup, when with a quick side motion the flask is removed and held for a moment to allow the water to fall from it, when it is set aside. Both flasks are treated in the same way. The water in the dry cups is then poured off without disturbing the cornets, after which the cup with the cornet in it is carefully dried and afterwards heated red hot in the muffle. The gold will be found to have regained its natural color and can be removed without danger and taken to the scales to be weighed. If the operation has been skillfully conducted the result is practically pure gold. It must be weighed accurately noting any memorandum regarding the position of the index in weighing out the bullion in the first operation. Its weight will represent the fineness of gold in the bar expressed, as before in thousandths.

As in the first example, suppose the total fineness to be 972, and the fineness of gold as found by assay, to be 898, by subtracting the result from the first, the fineness of silver will be found to be 72.

Now as an ounce of pure gold is worth \$20.6918, one one-thousandth will be worth \$0.0206918, therefore, an ounce of alloy containing 898 parts of pure gold would be worth  $898 \times 0.0206918$ , or \$18.56.327. The last three decimals may be disregarded unless the bar is very large.

The value of the silver is obtained in the same way. An ounce of pure silver is worth \$1.2929, and one-thousandth equals \$0.0012929. This multiplied by the fineness of silver as found would give the value of the silver in each ounce of the bar.

To facilitate this calculation I have computed a table by which multiplication is avoided.

TABLE FOR COMPUTING THE VALUE OF GOLD BULLION.

Fineness.	0	1	0	3	3	5	9	1	7	3	1	2
000%.....	0	2	0	5	7	1	8	3	4	5	2	5
001.....	0	4	1	3	4	3	5	6	9	2	5	0
002.....	0	8	2	0	1	5	0	3	8	7	5	0
003.....	0	8	2	5	8	7	3	3	8	5	0	0
004.....	0	8	2	5	8	7	3	3	8	5	0	0
005.....	1	2	4	3	5	9	1	7	3	1	2	5
006.....	1	2	4	3	5	9	1	7	3	1	2	5
007.....	1	4	4	7	0	2	8	4	2	3	7	5
008.....	1	5	5	3	7	4	5	7	7	0	0	0
009.....	1	8	6	0	4	6	5	1	1	5	2	5

TABLE FOR SILVER.

Fineness.	0	0	0	5	4	6	4	5	4	5	4	5
000%.....	0	0	1	2	9	2	9	2	9	2	9	2
001.....	0	0	2	5	8	5	8	5	8	5	8	4
002.....	0	0	3	8	7	8	7	8	7	8	7	5
003.....	0	0	5	1	7	1	7	1	7	1	5	8
004.....	0	0	5	4	4	5	4	5	4	5	4	0
005.....	0	0	7	7	5	7	5	7	5	7	5	2
006.....	0	0	7	7	5	7	5	7	5	7	5	0
007.....	0	1	0	3	4	3	4	3	4	3	3	5
008.....	0	1	1	5	3	6	3	6	3	5	2	8
009.....	0	1	1	5	3	6	3	6	3	5	2	8

The manner of using this table is the same as a similar one described in a former article:

800 same as 008 decimal 2 places right = \$16.53745  
090 " " 009 " 1 " " = 1.86045  
098 " " " " " = 1.6537

898 = \$18.56329

### SILVER.

070 = same as 7, 1 place right ..... \$0.0905  
002 " " " " " ..... .0025  
072 = \$0.0930  
Value of gold per ounce ..... \$18.56.32  
Value of silver per ounce ..... .00.30

Total value per ounce ..... \$18.56.32

These results multiplied by the number of ounces and decimals of an ounce the bar weighs, would be its value in dollars and cents.

Suppose the bar weighed 100 ozs.;  
Value of gold ..... \$1856.32  
Value of silver ..... .30

Total value ..... \$1856.52

The following must be stamped on the bar before it can be sold:

Number of the assay; name of assayer; weight of bar in ounces and decimals; fineness of gold; fineness of silver; total value of the bar in dollars and cents.

[To be continued.]

## PROPELLER ENGINES IN 1804.

BY OUR NEW YORK EDITOR.

In the life of some great man or other whose name we have forgotten, or may be never knew, we believe a story is told of a man "belonging to the Irish persuasion" who, in company one day, made a very brilliant and witty remark, but was promptly snubbed by another, who said that a Latin author wrote the same thing upwards of two thousand years ago. "O! Confound those ancients, they are always stealing one's best ideas," was the poor fellow's only reply.

"O! Confound those ancients, they are always stealing one's best ideas" was our thought, as we stood a few days since before a high pressure steam engine with a tubular boiler and twin screws used in a steamer on the Hudson river in opposition to Robert Fulton" in 1804, sixty-seven years ago. Sixty-seven years ago! Why that was before "Ericsson, the father of screw propulsion" was born. It was before a non-condensing engine was thought of, at least according to the authorities. It was before the days of lathes and planers and boring engines. Then a machine cut-screw was a refinement only dreamed of by the mathematical instrument makers. That was a time when files and hand-drills, and vices and blacksmith's hammers were the standard tools for workers in iron. Machine shops did not exist, and the blacksmith was the only machinist. In those days taps and dies produced such screws and nuts as would drive a journeyman blacksmith of the present day into fits. That was a time when a casting of a hundred pounds in weight was counted a greater thing in a foundry than tons do now.

Yet here, before our face, was a high pressure steam engine, which sixty-seven years ago was actually driving a boat some 40 feet long, by means of the two screw propellers on the table by its side.

Our readers may guess with what interest we examined every part of this engine. It was built by Col. John Stevens of Hoken, N. J.

The cylinder, which was upright, was about one foot long, and as the steam-chests are arranged so that their "nozzles" covered the whole cylinder-head under the covers, it gave the piston one foot stroke. The bore, as well as we could judge, is six inches. There are two cranks on a level with the base of the cylinder with their shafts parallel to each other and to the keel of the boat. There are no guides, and none are needed, as the action of the connecting rods neutralized each other. The shafts at a short distance from the cylinder carried two light cog wheels some 20 inches in diameter, which, meshing into each other, prevented one crank from getting out of stroke with the other, or from reversing in case the engine stopped on centre. The cross-head is very similar in form to that in use now and so are the connecting rods.

The crank brasses are like those in common use now, but the straps are a part of the piston rod and are cut open at the end so that the keys were outside of the crank pins. The valves are of the circular pattern, and we are told that they are much like two-way cocks. The valve motion would need a figure to explain it, but it is quite simple in action; the reversing wheel and the way in which it changes the driving wheel of the valve gear from one side of the driving stud to the other, would not be a bad idea on some styles of modern engines. The pump is inclined and is driven from a crank, and to-day works as easily as one could ask. It probably would take only a few hours to set the engine running.

The boiler is of welded iron tubes each about an inch in external diameter. The steam dome, into which they are all fastened, is about two feet high, oval in section, six inches in diameter at the top, and about eighteen inches at the bottom. The outside shell or fire box is about five feet eight inches long and eighteen inches square on the end. The safety valve is of the usual

pattern though seemingly small. The weight was missing.

The propeller shafts are about twelve feet long and rather over an inch in diameter. The hubs are tapered on each side of the blades so as to prevent as little resistance as possible to the water. The engine must have been about fourteen feet from the stern of the boat. The propellers themselves are nearly if not quite twenty inches in diameter. The blades stand at an angle of 45°, or nearly that. Taken all in all they are not nearly as old fashioned in appearance as one would suppose. The measurements which we give are mostly by the eye, as we had no other means of getting at dimensions.

We could hardly believe our own eyes as we examined the details of the machine. There were refinements of construction which in their rough way forestalled the most modern practice. The work, it is true, was of a rude kind, because performed with the most primitive tools, yet it was plain that it was no journeyman who handled the file which fitted the valve and pump guides.

As we turned away we could only think of the words "there were giants in those days." It was work worthy of a giant mind to design and construct such an engine at such a time and with such tools. We looked in vain through the fair to find another thing as far in advance of the time in which it was made, or a thing demanding as much power of thought to originate. It is almost without a parallel in history.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

- FOR THE WEEK ENDING SEPT. 26.
- HORSE-POWER.—Return J. Cheuey, Petaluma, Cal.
  - ANIMAL TRAP.—John H. Mooney and Geo. A. Lloyd, San Francisco, Cal.
  - MANUFACTURE OF DENTAL PLATES.—Francis M. Shields, Sacramento, Cal.
  - LAMP-WICK ADJUSTER.—Levi Bennett Lathrop, San José, Cal.
  - BUTTER-WORKER.—Peter P. Meredith, Stevensville, Mon. Ter.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Removal of Our Office.

We know that our readers feel a personal interest in the prosperity of our enterprise, and it is for this reason we will say a word or two about our removal. We dislike changes of business locations, on general principles; but we have been so long away from the business center of San Francisco, (which has for years been moving towards Market street,) that we very gladly embraced the opportunity of placing ourselves in our present desirable quarters, on the Southeast corner of Montgomery and California streets, diagonally across from the well known location of Wells, Fargo & Co's. Express office. We have taken a lease of the entire 3rd story of the building, where our numerous friends will find us with pleasant apartments. Every branch of our business has steadily increased, during the past eight years, and now fully justifies what we have fortunately secured, one of the best and most central locations in the city—where we shall at all times be pleased to see our generous and intelligent patrons.

Our editorial rooms and printing office will remain for the present at the old place, No. 414 Clay street.

AUTOMATIC STEAM VACUUM PUMP.—In our issue of Sept. 23rd, we inadvertently stated that Hanscom's Steam Vacuum Pump, was the only one that received a diploma at the late Mechanics' Fair. By request of Messrs. Hanscom & Co. we would state that the Knowles' Steam Pump also received a First Premium.

Mill Machinery Manufacture.

The extent to which the manufacture of specialties has been carried in our country is astonishingly large. In the large cities establishments have grown up which turn out material to the value of millions yearly. With their oft-used patterns, improved appliances and workmen skilled in their particular branch, such factories are enabled to supply the most distant places at prices which will bear the added cost of freight and yet will be lower than those possible in establishments of a more general character.

It is for this reason that we found in Philadelphia the extensive works of Thos. Wood, sending out their special class of machinery made to order for nearly every if not all the States in the Union. Over six hundred

Power Looms

Are made per annum by this firm. Their orders now are largely from the South and West—Texas and Colorado, both sending in lately.

Mr. Wood has two shops,—one at 2106

since the day of starting, and the bearings are reported still good and but little worn.

The bearings are all graduated in length according to the character of the journals they are to carry—from 1 to 6-in diameter. The only perfect set of

Graduated Pulleys,

From 4 to 78-in diameter in this country, are owned by Mr. Wood, who prides himself on the scientific exactness with which he can turn out his pulleys with all the requisite strength and with unrivalled uniform lightness. This is a feature especially favorable to buyers, who avoid the first cost of superfluous metal and its transportation, and receive a more evenly and elegantly running gear. His graduating scale governs the width of the face and the thickness and amount of metal in all parts of different width pulleys by their diameter. His patterns for molding pulleys and hangers are all of iron.

The works of this establishment were being extended by additional building and we were assured by the proprietor that his

Wood street, for shafting, hangers, pulleys, etc.; and the other, (occupying a lot 100x250 feet on the corner of Wood and Hamilton streets), for power looms. Over 150 men are employed.

The accompanying engraving shows plainly one of their two box power looms, a well finished and reliable machine in all respects. Those versed in such machinery will understand its features and we will therefore omit any lengthy description which would be uninteresting to others.

Their power looms embrace the latest actual improvements for a wide variety of goods, plain and fancy, in cotton and woolen.

Shafting and Mill Gearing

Have been a specialty with Mr. Wood for 30 years, and improvements have been steadily added until great precision and economy has been attained in all work—which embraces the taking of plans for factories in any locality and fitting them out completely with shafting and gearing of the most approved patterns.

Self-Oiling Hangers

For shafting are coming popularly into use, 25,000 per annum going out of this establishment. The boxes are formed with grooves in such a manner that by capillary attraction, the oil is carried by the stuffing to the shafting and distributed, and by gravitation is returned again free of dirt and foreign substances for re-distribution.

The style shown us here were superior for lightness obtained without compromising strength in the parts liable to strain. Their efficiency and durability is attested by the fact that a line of shaft of 110 feet held by 13 hangers has run in daily use since April, 1867, without oiling the boxes

devotion to the manufacture of certain specialties was being fully appreciated and evidenced by the return of duplicate orders, most markedly from the South and West.

THE SCHELL CREEK MINES.—These mines, which are just now attracting much attention, constitute a recent discovery in the vicinity of the old Schell Creek Station, or the Overland Mail route. According to the *Elko Independent* they are creating an excitement little less than that which accompanied the discovery of the Eberhardt mine, at Treasure City. Miners are flocking thither in great numbers. Already, it is said, there are more than 1,500 in and around Schellburn, as the new town laid out near the mines is called. Our correspondent, Mr. A. J. Brown has visited the locality and in a communication in another column, gives us an interesting description of the locality.

MACHINE WORKS.—A few days ago, we stepped into the machine shop of Mr. Geo. T. Pracy, 409 Mission street, in this city. Although situated somewhat on the outskirts of the general location of similar establishments, we were pleased to see the large amount of business carried on in a place so unpretentious and the good taste displayed, particularly in the selection and use of the best character of tools, together with the general order and arrangement of all its internal workings. For the kind and variety of work turned out, our readers are referred to advertising columns.

LOW WATER.—The Sacramento river is one foot lower at Chico than ever known before.

Explosion of Torpedoes.

NOTES BY OUR NEW YORK EDITOR.

On the 14th. of last month, New York had another horror added to its list. A truck-load of what are known as Union Torpedoes, exploded, doing a fearful amount of damage.

The chief interest which the explosion has, is from the fact, that the ruins give a good illustration of the peculiar effects of a powerful explosive in a great number of small charges fired simultaneously.

The annexed sketch is a section of one of these torpedoes full size. They are made by a machine from a fine clay, and the hole in them filled with a substance which the makers say is not nitro-glycerine. If their statement is true, it only proves that they have discovered an explosive compound equally dangerous and very much like it in results. The opening in the clay is closed by a piece of tissue paper.

The report from one of these is fully equal to that from a navy revolver; the explosion of one is wonderful. Though

the total amount of nitro-glycerine in the whole lot which exploded was small, yet it was large enough to rend to fragments almost every part of the truck; nothing seemed to escape, even the hickory "rungs" standing loosely in their holes were split and shivered to shreds, the double-tree shared a similar fate, and so did every part of the truck, and every object in the vicinity. The small amount of injury done to persons at a distance, and to the buildings, was probably due to the small size of the fragments. Everything was reduced to bits at the instant of the explosion, and consequently there were no large fragments to fly about, a characteristic point in nitro-glycerine explosions.

WATCHES AND JEWELRY.—Our friends may have recently noticed Mr. F. J. Nash's advertisement of jewelry and watches, in our columns. We very cheerfully give Mr. Nash our endorsement. We have recently had some dealings with him, and find him in every way reliable. His business is conducted on what is to many a new plan, but which affords great advantages to the purchaser. He offers to distant purchasers, as great facilities for buying Waltham and Elgin watches, as though they were on the spot, while his prices are much lower than the published lists. He sells solid silver and 18 and 14 carat gold watches of foreign manufacture at very much under the usual rates, and allows purchasers the privilege of opening all goods sent by express, before paying for them, and returning them if not found all right. It will interest our readers perhaps, if we explain the way in which Mr. Nash is enabled to sell standard goods so cheaply. It is accomplished in this way—he buys directly, and in large quantities, from the manufacturers, and sells to individuals giving them the advantage of two profits or commissions which they would otherwise be obliged to pay to retailers. That is the whole secret. There are two profits saved to the customer, which are usually very large.

CIGARS BY MACHINERY.—Mr. J. A. Heald, for several years the patriotic leader of the American Brass Band, in Washington City, has completed a device for making cigars entirely by machinery. He employs six rollers for sharpening the cigars—the rollers being convex instead of concave as in other machines. Mr. Heald has one of the most indomitable wills we ever met, and has spent fourteen years on this apparatus, which is protected by six patents, embracing 60 claims. His present address is Lowell, Mass.

## DOMESTIC ECONOMY.

### The Philosophy of Eating.

The young eat for three reasons: 1st, to grow; 2d, to keep warm; 3d, to repair waste. Hence all food contains one of two elements, and sometimes both, called nitrogen and carbon. The nitrogen makes flesh, sometimes called muscle, and is the same as lean meat. Carbon makes fat, and is that which keeps us warm. Sugar, starch, arrowroot, oil, butter, suet, and lard have no nitrogen, there is nothing in them to make flesh out of; all the nutriment they afford to carbon, is the material for warmth.

Infants and children often get so chilly as to freeze, as it were, unless they had something sweet in their food; hence nature has implanted in them an unspeakable taste for sweet things. The thing the newborn infant needs first and always is warmth. Butter, oils, and starches abound also in the heat-producing elements, but require strong powers of digestion—are applicable to grown persons, and to the old; hence, as we grow old, we like fat meats and butter more.

It is in obedience to these laws that the Almighty beneficence and wisdom has imparted a relish for the oils and fat meats in winter, because extra heat is needed. The Greenlanders; whose country is always covered with ice and snow, consider butter and lard and tallow candles and the rankest oils the greatest luxuries conceivable. But rice, on which many in warm countries chiefly live, is said to contain scarce one per cent. of the fat or heat-producing element, while oils have 96 per cent. of it.

All know buckwheat cakes are relished in winter, but as spring comes on we begin to lose our appetite for them. The cakes themselves contain 54 per cent. of fat as heat-producing elements, and they are made more palatable by spreading butter on them, and molasses, each being almost entirely—96 per cent.—heat-producing.

But out-door workers eat meat and bread the year round, and never weary of it, because 22 per cent. of such food is flesh-forming, and gives that much power and strength to work.

**PARLOR MATCHES.**—A good match is still a thing to be desired, and a man who invents the right thing will be a benefactor. What are called parlor-matches, having paraffine or some like substance instead of sulphur to set the stick aflame are dangerous in any case, and rendered more so by carelessness in the manufacture. Such a match dropped on the floor is ready to flash under the tread of a child's foot and set its dress on fire, and is by no means a safe domestic appliance.

But as they are now made the danger is increased. Out of a whole box perhaps only half will ignite. As for the rest, their heads fly off and scatter themselves about the house ready to burn a hole in the carpet, if they do no more damage, when any one steps upon them; to say nothing of the disagreeable crash as of a percussion cap under one's feet.

People had better leave such wares alone and put up with the plain sulphur matches till something better is devised. The death of the young Austrian Princess by treading on the parlor match a few years since may well stand for a warning.

**TO STEAM A TURKEY.**—Rub pepper and salt inside the turkey, after it has been well dressed and washed; then fill the body with oysters; sew it up carefully; lay the turkey in a large dish, and set it on a steamer, placed over boiling water; cover closely, and steam from two hours to two hours and a half—or till by running a fork into the breast you find it is well done. Then take it up; strain the gravy which will be found in the dish; have an oyster sauce ready, prepared like stewed oysters, and pour this gravy, thickened with a little butter and flour, into the oyster sauce; let it just boil up, and whiten with a little boiling cream; pour this sauce over the steamed turkey, and send to the table hot. Of course, while the turkey is steaming, you will have the oysters all ready for the gravy from the dish, and the cream also boiled, that there may be as little delay as possible after the turkey is cooked.

**TO KEEP BUTTER.**—A simple mode of keeping butter in warm weather, where ice is not handy, is to invert a common flower-pot over the butter, with some water in the dish in which it is laid. The orifice at the bottom may be corked or not. The porousness of the earthenware will keep the butter cool.

### Drying and Cooking Green Corn.

Putting up corn in salt, and then soaking it to get the salt out, in my opinion draws all the sweetness from it. My way is to take the corn when in the right stage, neither too young nor too old, have on the fire a large pot of boiling water, clean the corn of silk, drop it in the pot and parboil till half done; take up, let it drain and cool, then cut, not too close to the cob, but scrape the cob after it is cut, spread on a sheet and dry in the sun. Dry as quick as possible to prevent souring. Let it get thoroughly dry before putting away; put in a thin cotton sack and hang in a cool, dry place. Sun occasionally to keep it from getting musty.

To cook it, take as much as you require, winnow it to get the chaff out, wash through one water, and put in soak in just enough water to cover it; you may put it in soak as early after breakfast as you like; about two hours before dinner, put it on in warm (not hot) water, and boil gently, but steadily, for an hour and a half, or until the corn is tender, and the water nearly all hoiled away. Then add a cup of rich milk, a good lump of butter, and salt and pepper to taste, and let it stew in this another half hour so as to have just a good gravy to it when done. When you put it on to boil, turn in the water in which it has soaked. I allow a quart of water to a cup of corn, and let it boil away till nearly dry; but if boiled too fast it will hoil away before the corn is done. Stir it once in a while and mind it does not burn after the milk is put in. I hope some of your readers will try my way, for every one tells me that I cook it better than any they ever tasted. Be sure and not have the liquor too thin, and have it rightly seasoned. If there is too much water remaining after it is tender pour some off before you add the milk, but it is better to reduce it by boiling so as to retain the flavor of the corn as much as possible.—*Rural New Yorker.*

**PICKLED WALNUTS.**—Gather the nuts just before the kernel commences to harden, prick them through and through several times with a coarse needle, put them into a crock, pour over them a rather strong brine, and allow them to remain for three or four days; drain and spread them in the sun until they are dry, and have turned to a dark brown or nearly black color. Put them now into a suitable jar, and pour over them boiling spiced vinegar, using two ounces of mustard seed, a little mace, two ounces of allspice, and two ounces of whole black pepper, to one gallon of vinegar; a few onions may be added if your taste will permit. This pickle may be used any time after making, but is much better for being kept a year. After the pickles are used the vinegar may be hoiled and bottled for catsup.

**DRYING PEACHES.**—Never pare peaches to dry. Let them get mellow enough to be in good eating condition, put them in boiling water for a moment or two, and the skins will come off like a charm. Let them be in the water long enough, but no longer. The gain is at least six-fold—saving of time in removing the skins, great saving of the peach, the part of the peach saved being the best part, less time to stone the peaches, less time to dry them, and better when dried. A whole bushel can be done in a boiler at once, and then the water turned off. Two bushels can be skinned, stoned (halved,) and on the boards, before a quarter of them could have been peeled.

**SAVE THIS FOR NEXT WINTER.**—To mend rubber shoes, get a piece of pure rubber—an old shoe—vulcanized rubber will not do; cut it into small bits; put it into a hottle, and cover to twice its depth with spirits of turpentine or refined coal tar naphtha—not petroleum naphtha. Stop the hottle and set to one side, shaking it frequently. The rubber will soon dissolve.—Then take the shoe and press the rip or cut close together, and put on the solution with a camel's hair brush. Continue to apply as fast as it dries, until a thorough coating is formed.

**TO PRESERVE PEGGED BOOTS AND SHOES.**—It is said that if pegged boots are occasionally dressed with petroleum between the soles and upper leather, they will not rip. If the soles of boots and shoes are dressed with petroleum they will resist wet and wear well. The pegs, it is said, are not affected by dryness after being well saturated with the liquid.

### Domestic Receipts.

**PUMPKIN PIES** is a seasonable receipt at this time. If you would have a superior pie;—Stew the pumpkin, then strain—but remember, it must be a fine grained pumpkin—cream is preferable to milk where it can be had; use but small quantity of egg; mace or cinnamon for spice, or both, or none. Our wife prefers none. Roll the pastry very thin. A crust can be dispensed with by sifting a thin layer of corn meal over the oiled pie dish; it forms a sufficient firmness to hold the “filling” when served.

**CRAB APPLE JELLY.**—If you would have it nice, take four quarts of apples or more, put them in a kettle to hoil with enough water to come to the top of the apples, let them hoil slowly for three quarters of an hour, then drain off the liquor and add its weight in sugar. Boil fifteen or twenty minutes. Take off the scum as it rises. Put into glasses as soon as it is done.

**FRENCH MERINGUE.**—One gill of sugar; one quart of milk; one pint of bread crumbs; the yolks of four eggs. Flavor to taste and bake. When cold, spread on top a little raspberry or other jam or jelly; beat the whites of the eggs to a meringue; sprinkle with fine sugar and brown for a moment in the oven.

**TO CLEAN KNIVES.**—Cut a good-sized, solid, raw potato in two; dip the flat surface in powdered brick-dust, and rub the knife-blades. Stains and rust will disappear.

**SAUCE FOR SALADS.**—Two hard hoiled yolks of eggs, mashed smooth, with a tablespoonful each of cream and olive, add sufficient vinegar to make it pretty sharp.

**A NICE OMELET FOR BREAKFAST.**—Beat two eggs, yolks and whites together, in a bowl until very light. In a cup put one teaspoonful of corn starch; add slowly a half teaspoonful of milk (new milk is best); when well stirred and smooth, pour this over the eggs, and heat them all well together for a few minutes; a little chopped parsley can be added if wished. Cook as other omelets. In making any kind of omelet salt and pepper should not be added until sent to table; and to have them perfectly light and not tough, the ingredients must be well and quickly beaten with the fork. The quantity given for this omelet is enough for three persons.

### Mechanical Hints.

**TO DARKEN LIGHT MAHOAGNY.**—In repairing old furniture it sometimes happens that we cannot match the old wood. In such cases, after the repairs are completed, to prevent the pieces looking like patches, wash them with soap suds, or with water in which quick lime has been dissolved; but be careful not to let either be too strong, or it may make the wood too dark. It is best to use the wash weak at first, and if the wood is not made dark enough repeat.

**GUM TRAGACANTH MUCILAGE** can be prepared much more quickly and of a more uniform consistency by first rubbing up the powdered gum with a little glycerine before the water is added; as in this way the formation of lumps is entirely avoided.

**HOW TO CUT A GLASS BOTTLE OR DECANTER WITHOUT A DIAMOND.**—A correspondent sends the following: “Dip a piece of fine twine in cold water, then tie it tightly round the bottle or decanter where you wish to cut it; care should be taken to have the twine quite straight; hold the decanter over a candle keep turning it round until it becomes quite hot; then put it in cold water so that the edge of the twine is just covered; the decanter will be cut level with the twine.”

**THE QUALITY OF GLUE.**—Experience has shown that glue undergoes a chemical change when dried in the air, and its adhesive properties are decidedly deteriorated. To avoid this, says Prof. Wagner, in his report for 1869, some of the manufacturers have introduced a pure liquid glue in close packages, which is said to be superior to the dry article. It is prepared by digesting hones in a peculiarly constructed apparatus, and is sold according to a fixed specific gravity, so that the purchaser does not pay for the water, which, in dry glue sometimes amounts to twelve per cent. The price is also less than for dry glue.

**GREEN TOMATO SAUCE.**—One quart of green tomatoes cut up fine, a small onion shred fine, a tumbler of good brown sugar, one of vinegar, pepper, salt, allspice, and cloves to taste. Boil to a jam, stirring frequently. It must not scorch. An excellent sauce for fresh meats. Keep in small jars.

## LIFE THOUGHTS.

God helps those who help themselves.  
Look before you leap; think before you act.

Good manners are sure to procure respect.

The blood is to the flesh what rain is to grass.

POLITENESS is like an air cushion; there may be nothing in it, but it eases our joints wonderfully.

As daylight can be seen through very small holes, so little things illustrate a person's character.

If a man does not make new acquaintances as he advances through life, he will soon find himself left alone. A man should keep his friendship in constant repair.

YOUTHFUL minds, like the pliant wax, are susceptible of the most lasting impressions; and the good or evil bias they then receive is seldom if ever eradicated.

He that speaks, sows; he that hears, reaps; hence we should be guarded as to how we speak, as to what we hear. “He that hath ears to hear, let him hear;” but take heed how ye hear.

Men's lives should be like the days, more beautiful in the evening; or like the summer, aglow with promise; or like the autumn, rich with the golden sheaves, where the good works and deeds have ripened on the field.

The very best and the very worst of men are as good, or not as bad as they seem to be. Calculate accordingly in estimating your fellow-men.

If you are to judge of a watch, which you find does not go well, you will certainly examine whether the movement is hindered by any accidental obstructions, before you condemn it. Should not the same rule be observed where it seems to be often neglected? I mean in our judgment of each other.

### The Way to Success.

Fortune, fame, success, position are never gained, but by piously, determinedly, bravely sticking, living to a thing till it is fairly accomplished. In short, you must carry a thing through if you want to be anybody or anything. No matter if it does cost you the pleasure, the society, the thousand pearly gratifications of life. No matter for these. Stick to the thing and carry it through. Believe you were made for the matter, and that no one else can do it. Put forth your whole energies. Be awake; electrify yourself; go forth to the task. Only once learn to carry a thing through in all its completeness and proportion, and you will become a hero. You will think better of yourself; others will think better of you. The world in its very heart admires the stern, determined doer. It sees in him its best sight, its brightest object, its richest treasure. Drive right along, then, in whatever you undertake. Consider yourself amply sufficient for the deed. You'll be successful.

**GUILT**, though it may attain temporal splendor, can never confer real happiness. The evil consequences of crimes long survive their commission, and, like the ghosts of the murdered, forever haunt the steps of the malefactor. The paths of virtue, though very seldom those of worldly greatness, are always those of pleasantness and peace.—*Sir Walter Scott.*

**THE INFLUENCE OF ONE ACT.**—One pound of gold may be drawn into a wire that would extend around the globe. So one good deed may be felt through all time, and cast its influence into eternity. Though done in the first flush of youth, it may gild the last of a long life, and form the brightest and most glorious spot in it.

**TRUE Religion** is not a routine of ceremonies, nor yet the essence of any special creed. The religious sentiment is inherent in every nation of the human race. It gives a beauty of its own to all the external forms of creation, and everything that is true and noble in man's soul springs from its source.

It is as unjust to the Bible as it is votacious to science to endeavor to reduce scientific systems into conformity with the Biblical accounts, or to require the Bible to give us scientific systems.

**REASONING** against a prejudice is like fighting against a shadow; it exhausts the reason without visibly affecting the prejudice. Argument cannot do the work of instruction more than blows can take the place of sunlight.

## Eastern Advertisements.

## STEPHENS &amp; CO.,

MANUFACTURERS OF

U. S. STANDARD BOXWOOD AND  
IVORY RULES.

ALSO EXCLUSIVE MANUFACTURERS OF

L. C. Stephens' Patent Combination Rule.

This cut represents the COMBINATION RULE, which comprises a Foot Rule, Spirit Level, Try Square, Bevel, Plumb, Slope Level, Etc.

It is made of the very best quality of Turkey Boxwood, heavily bound with brass, and is graduated with mathematical accuracy.

The Square is adjustable, and can be tested and made perfectly true by the aid of a small screw-driver, but this is seldom required.

In its application as a Slope Level it is especially adapted for Miuera's use, as it shows the PITCH TO THE FOOT, and DEGREE OF INCLINATION at once. It is six inches long when folded, by one and three-eighths wide, and three-eighths inches thick, the cut being just one-fourth size.

"By the use of one of these, a builder, mason, carpenter, or other workman, can always have in his pocket the most valuable of his apparatus used in construction, combined in a portable, useful and cheap form."—Scientific American.

Price by mail, prepaid, \$4. For agents' terms, address STEPHENS & CO.,  
Riverton, Conn.

## Academy of Sciences.

## Interesting Discussion About the "Dust Shower."

At the meeting of the Academy on Monday evening last Mr. H. G. Hanks exhibited

## A Curiosity,

in the shape of a singular concrete substance taken from the stomach of a deer. This substance, which was nearly round and about three inches in diameter, black and very hard, he stated was highly valued by the Mexicans for its traditional medical virtue, and was to be sent there by the owner and sold for charms. The cause and formation of this substance afforded food for considerable discussion.

## The Dust Shower.

Our readers will recollect the statement which recently appeared in the public prints to the effect that while, on the morning of September 10th, 1871, the ship *Transito d'Alvarez*, Captain S. P. Lund, was about 85 miles west of Cape Lookout, on the coast of Oregon, with a light breeze blowing, which continued for three days, the sun was obscured for an entire day by a peculiar yellow haze, and during this obscurity it was observed that a light dust was falling. A small quantity was collected, and furnished to Mr. Hanks, upon the examination of which, he made the following report:—

The microscope revealed, in the heavier portion of the dust whitish particles resembling chloride of ammonium, but which were insoluble in water and not acted upon by the mineral acids. Particles of sand were also present, and some dark-colored grains, the nature of which was not evident. But the most interesting discovery was a black, cellular, shining substance of very peculiar appearance. After many comparative tests it was found that fine charcoal most resembled it under the microscope, but upon its being placed on platinum foil and exposed to red heat, it was found to burst into a dense flame, leaving a whitish ash, resembling no coal that could be obtained. In a closed tube it gave off water, followed by a copious distillate of a heavy yellow oil with a strong bituminous smell.

The reading of the report led to a very interesting discussion as to the supposed cause of this dust fall, and many views were expressed. Mr. Hanks stated that at first he was of the opinion that the deposit might be partially formed of smoke from tulle fires, but the absence of vegetable charcoal contradicted this. He had also thought this might have been caused from the volcanic eruptions on the Sandwich Islands. The volcanic matter carried above the trade winds was there carried to the northern country.

Prof. Kellogg believes this might have been a *bona fide* dust shower. Showers of rain and of iron are common, and it was known that dust was continually falling at some places.

Dr. Cooper advanced the opinion that the burning asphaltum beds on Whidby's Island, near Vancouver's Island, might have furnished this phenomena. These beds often caught on fire, and the smoke, in extensive clouds, was carried a great ways, and some particles of sand or silica in this case, may have been carried with it.

This theory was considered the more probable of any advanced, the analysis of the dust proving it to be very similar to the particles arising from burning asphaltum.

**RAIN.**—Humboldt county, the Russian river, and some portions of Sonoma county, have been visited with quite copious showers within the past two weeks. The Humboldt *Times* thinks considerable injury must have been done to the wheat and hay which was exposed to the weather in that locality. The same rain, according to the Vallejo *Chronicle* extended southerly as far as the borders of Solano county. A few scattering drops fell in Vallejo.

It is quite time that farmers were getting their grain and hay under cover, as the indications rather point to early rains. Much damage has been done to exposed grain nearly every season, in the past, but it is to be hoped that the scarcity and high price of grain this year will lead to more care in guarding against such unnecessary loss.

**THE WINE GROWERS** of San Joaquin County will make a much larger quantity of wine this fall than ever before.

## The Merced Cotton Experiment.

Notwithstanding the success of this particular enterprise on the Buckley Bros' ranch, there is no reason for supposing that cotton can be grown with profit in the great central valleys of the State, generally. The plant must have access to moisture in some way; yet there are few plants which thrive better than this from irrigation.

The Merced plantation is located directly upon the bank of the river, and at a point where the land is generally only two or three feet above the surface of the water, hence the roots of the plant have no difficulty in finding a sufficiency of moisture. A small portion of the field, which was a little above the general level had to be irrigated. This experiment, however, proves that our soil and climatic conditions are very favorable for such a growth, which might undoubtedly be made a valuable crop on most lands, the breadth of which is constantly being increased by reclamation from the tule; and on much other land which is conveniently located for irrigation.

According to the Snelling *Argus*, some of the stalks contained over 200 well developed bolls, and on one 250 were counted, each of which, it was thought, would fully mature. Col. Strong expects to gather 1½ bales per acre—more than double the average product of cotton lands of the Southern States. Picking has already commenced and will probably be continued until the rains set in, as in our dry climate no damage can occur to the fibre until that time.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

W. H. MURRAY—General Traveling Agent.  
C. H. DWIGGELL—Special Corresponding Agent.  
TALBOT P. POWERS—Solano and neighboring Counties.  
I. N. HOAG—Sacramento, General Agent.  
F. M. SHAW—San Diego.  
L. P. MCCARTY—California.  
T. W. DRULLMAN—California.  
M. W. LEVY—Denver, Colorado.  
M. B. SEAR—Pacific Coast.  
THOS. POYZEN—California.  
WM. J. CLARK—California.  
JOSEPH DIMMICK—California.  
E. P. HICKS—California and Oregon.  
A. O. KNOX, City Soliciting and Collecting Agent.

SUBSCRIBERS should send former address, when ordering the paper sent to a new place. Returning a newspaper or blank slip, WITHOUT THE NAME AND RESIDENCE OF THE SUBSCRIBER is a thoughtless act, and useless both to subscriber and publisher.

**SUCCESS IN BUSINESS.**—Success in the business world usually depends upon being thoroughly prepared for its duties. Young men! if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best college, located in the leading commercial cities of the United States and Canada. There are many interesting features about the school which cannot be discussed here. Call at the College and examine its workings. If unable, send for circular, and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address E. P. HEALD, President, Business College, San Francisco, Cal. 10v23p-3m

**N. Seibert's Eureka Lubricators** for steam cylinders are acknowledged by all engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not rust or gum, and will pay for themselves in a short time, in the saving of oil, over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First street, San Francisco. 8v23-3m

**UNIVERSITY OF CALIFORNIA.**—The Preparatory Department is under the charge of five Professors of the University, and six tutors.  
Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-keeping are taught.  
Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TAIT, Oakland, Master Fifth Class. 8v23p1f

**Opera Glasses, Pebble Spectacles, and Eyeglasses,** in great variety, wholesale and retail. C. MULLER, Optician, 205 Montgomery street, Russ Block, San Francisco. 7v23-3m

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 76 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 23v1-12m3p

**LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine** against easy monthly installments may apply to No. 294 Bowers, 157 E. 26th, 477 9th Ave., New York Good work at high prices if desired. 23v1-12m3p

## Office or Shop Room

## TO LET.

It is a new foot-power Press, and just the thing for a small country job office or for amateur printers, and druggists and others who wish to do their own printing. At manufacturers' price, with freight added. Enquire at this office. 11v2fr-lams

## To Lease.

A promising mine in a locality easy of access. Wood and Water plenty and near. Full particulars given by "W. H.," at this office. 12v23-1m

## CELEBRATED

## Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester: Cross and Blackwell, London, &c., &c., and by Grocers and Olfemen universally. Agents, CROSS & CO., San Francisco. 1v22-lyeow

Under a Burning Sun, where Bilious affections and Fevers of various descriptions so generally prevail, Tarrant's Effervescent Seltzer Apertient

Has been successful beyond all parallel. Hence the physicians of the tropics give it their emphatic sanction, prescribing it in preference to every other apertient in use. The patients, of course, gladly acquiesce, for this preparation is one of the most delightful, as well as mild and cooling cathartics, chemistry has yet devised, and possesses every medical virtue of the far-famed German Seltzer Spa. It is a powder that only requires the addition of water to produce in an instant a delicious effervescent beverage, as well as an invaluable medicine. Ask for and accept none but the genuine.

SOLD BY ALL DRUGGISTS.

## The California Powder Works

No. 314 CALIFORNIA STREET,  
SAN FRANCISCO.

Manufacturers and have constantly on hand

## SPORTING, MINING, And BLASTING POWDER.

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

**Three Gold Medals** By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our **HERCULES POWDER**, which combines all the force of other strong explosive now in use, and the lifting force of the most powerful powder, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office. 16v20-3m JOHN F. LOHSE, Secretary.

Mining and Other Companies.

Due to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

**Alameda Coal Mining Company—San Francisco and Alameda Counties, State of California.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 5th day of September, 1871, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, 409 Battery street (first floor), between Olay and Merchant streets. Any stock upon which said assessment shall remain unpaid on the 8th day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 30th day of October, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

And in accordance with law, and an order of the Board of Trustees, made on the 31st day of July, 1871, "and one subsequently made on account of postponement," so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the company, Room 5, No. 302 Montgomery street, San Francisco, California, on the 15th day of October, 1871, at the hour of 2 o'clock p. m. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.  
WM. H. WATSON, Secretary.  
Office, Room 5, No. 302 Montgomery street, San Francisco, Cal. se2-3w

**Piermont Milling and Mining Company—Location of works, Piermont Mining District, White Pine County, Nevada.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the fourth (4th) day of September, A. D. 1871, an assessment (No. 1) of one dollar and twenty-five cents per share was levied on the capital stock of said company, payable immediately, in U. S. gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco. Any stock upon which said assessment shall remain unpaid on Monday, the 5th day of October, A. D. 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before the hour of 2 o'clock p. m. of Wednesday, the 8th day of November, A. D. 1871, will be sold to pay the delinquent assessment, together with the costs of advertising and expenses of sale.  
J. W. CLARK, Secretary.  
se2-4w

KNOWLES' PATENT STEAM PUMP.

Awarded First Premium and Diploma  
Over all Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Premium and Diploma at State Fair, and Gold Medal Recommended.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.  
The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.  
The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.  
The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rings or a patent fibrous head, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purposes, are got at immediately without removing any nuts or bolts.

**CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, CAL., April 14, 1871.**  
A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have sixteen of them in use on this road as fire engines, and pumping water for stop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other.  
Yours truly,  
A. J. STEVENS, General Master Mechanic.

**OFFICE OF PEOPLE'S TRANSPORTATION CO., PORTLAND, OREGON, April 22, 1871.**  
Mr. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order per steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider them the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best Pump in use.  
Yours respectfully,  
G. MARSHALL, Chief Engineer.

**OFFICE OF N. Y. CENTRAL R. R., ALBANY, June 3, 1871.**  
Messrs. KNOWLES & SIBLEY, New York—Gents: Yours of 31st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.  
Yours very truly,  
C. P. HARM.

**OFFICE OF DELAMATER IRON WORKS, NEW YORK, May 26, 1871.**  
Messrs. KNOWLES & SIBLEY, 92 Liberty street—Gentlemen: In reply to your inquiry as to my opinion of your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.  
Yours very truly  
GEORGE M. REYNOLDS, Supt. Engineer.

**U. S. NAVY YARD, NEW YORK, June 3, 1871.**  
Messrs. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.  
Yours very respectfully,  
WM. W. WOOD.

**OFFICE OF THOMAS IRON WORKS, HOKENDAUCA, Pa., June 1, 1871.**  
Messrs. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of a great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we have had in use now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, which to say the least are about the best we have tried. I cheerfully recommend "The Knowles Pump" to any who may have use for a first-rate Steam Pump.  
Respectfully yours, etc.,  
EDWIN MICKLEY, Supt. of Mines.

**OFFICE OF THE SAUCON IRON CO., HELLENSTOWN, Northampton County, Pa., May 26, 1871.**  
Messrs. KNOWLES & SIBLEY, New York—Gents: We can most cheerfully respond to your inquiry as to the qualities of the Knowles Patent Steam Pumps we have in use. We bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnace and at the mines working in clear and muddy water, and have put them to severe tests. And we can say that they have given VERY GREAT satisfaction, and that we like them better than any we have ever used.  
Yours very respectfully,  
G. W. WHITAKER, President and Superintendent.

**OFFICE OF NEW HAVEN WATER CO., Dec. 18, 1860.**  
Messrs. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 18-inch dia. steam cyls., 12-inch dia. water cyl., and 34-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of about of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.  
Yours very truly,  
P. SAULT, Superintendent.

**OFFICE OF RED BLUFF WATER WORKS, RED BLUFF, June 11, 1871.**  
A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working now four months, and has given entire satisfaction; and I take great pleasure in recommending them to be all you have claimed for them, and I will add that I think they have no equal. Yours, etc.,  
JOHN CLEMENTS, Engineer.

WE BUILD AND HAVE CONSTANTLY ON HAND  
THE LARGEST STOCK OF PUMPS IN THE WORLD,  
And for Every Conceivable Purpose.  
A. L. FISH, Agent.  
No 6 First Street, San Francisco, Cal.  
P. S.—All kinds of new and second-hand Machines on hand. 24v22-eow

**Pocahontas Gold Mining Company—Location of works, Mud Springs, El Dorado county, Cal.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 13th day of September, 1871, an assessment of three dollars (\$3) per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 418 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 23rd day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 27th day of November, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
D. A. JENNINGS, Secretary.  
Office, Room No. 25, 418 California street, San Francisco, California. se23-td

**Silver Sprout Mining Company—Location of works and mines, Kearsarge District, Inyo County, State of California.**  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of September, 1871, an assessment of twenty-five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 318 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 13th day of November, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

**JOHN B. MORROW,**  
Machinist and Model Maker.  
Patent Office Models made with neatness and dispatch at Reasonable Rates. 247 Fourth street. oct4-1f

**Longshore's Combination Tool.**  
  
This device is just what its name indicates. As a Kitchen Tool it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c. It answers the double purpose of hammer and pliers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pliers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

## WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill,

RECOLLECT

This Mill is Fully Guaranteed

to do and he all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbag," but call and investigate its merits. One can always be seen at the Pacific Iron Works. Ten of these Mills are now in operation. For further particulars address

FURMAN E. WILSON,  
San Francisco.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION.—D, is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the operation of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. fels-tf

CRAIG & BREVOORT'S  
Patent Condenser for Steam  
PUMPS, &c.

NO. 1.

The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engines; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as a guide to float F.

The valve, C, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.

NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is especially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address H. L. BREVOORT, 6v23cowlly 128 Broadway, New York City.

THE HESSE GRINDER AND AMALGAMATOR.

This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

**Varney's Patent Amalgamator.**  
These Machines Stand Unrivaled.  
For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.  
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.  
This Amalgamator Operates as Follows:  
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.  
Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.  
Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

## Designing and Engraving

By the Best of Artists,  
At this Office.

To Inventors in the Pacific  
States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

### To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it. Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., SCIENTIFIC PRESS OFFICE SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS 112 illustrated mechanical movements and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAWS of 1870.

### IMPORTANT TO MINERS.

A CHEAP AND DURABLE DEVICE FOR SAYING FINE GOLD AND QUICKSILVER.

Frey's Improvement on Evans' Under-current Sluices.

This is a sluice made of cast-iron, with transverse corrugations on the bottom, semi-circular in shape and three inches deep. At the bottom of each alternate corrugation is a narrow slit through which the heavier material falls down into another rifle below with larger corrugations. Both rifles are set on the same grade, which should be about one foot in twelve. The lower box is charged with quicksilver. These Sluices do not clog, nor do they require any attention beyond cleaning up once a week. These sluices have stood the test of use in quartz mills below all the contrivances for saving gold, and have made large returns of gold, silver, concentrated sulphurets and quicksilver, that would otherwise have been lost. From the Green mine, Ophir District, Placer county, I have received the following certificate:

OPHIR, August 5th, 1871.  
Dr. Jos. M. FREY—Dear Sir: Having been engaged as amalgamator in Green & Co.'s mill, where we are using the Hepburn pans and settler, and having below the settler a set of Frey's Under-current Sluices and Rifles, I am well satisfied after some sixteen years experience in the use of various modes and machines for amalgamation of ores, that your Rifle is capable of concentrating and saving most of the fine quicksilver and light amalgam, in which consists the great source of loss by every known process of working ore.

(Signed) Yours respectfully, J. R. MORSE, Also, from E. N. RICE, of Nevada Metallurgical Works, 21 First street, San Francisco.

Dear Sir: Having had opportunity to watch your Corrugated Rifles, in operation for over a month at Reno, I can say that these Rifles work splendidly as quicksilver savers and concentrators of unroasted ore. I have also no doubt that they could save very fine gold, as for instance in black sand or slimes, better than any like apparatus in use. Respectfully, (Signed) E. N. RICE.

Assay of tailings saved at the Rhode Island Mills, Nevada, by these Sluices:  
Gold.....\$75.24  
Silver.....76.96  
Quicksilver.....250 lbs. to the ton  
This was the saving of one week.  
For further particulars address WATERS & CO., No. 54 J street, Sacramento, the Agent for the State. 8v23-3m

Number 15.

## GWYNNE'S DRAINAGE SIPHON.

The drainage of lands by means of pumping apparatus is a branch of engineering very fully developed in many countries of Europe; but in this it has not yet received the attention that at no very distant day must be accorded to it. The engraving which we here give from an English exchange represents a siphon—so-called—constructed by Messrs. Gwynne & Co., of London, and specially designed for drainage operations of minor or moderate magnitude. In the engraving, *B* is a siphon of ordinary construction, but having a flap-valve, opening inwards or upwards, attached to the inner end, and which prevents the water flowing back again. At the other end of the siphon another valve is fixed which opens outwards, and which is shown in the engraving closed by the chain, *C*. Attached to the siphon is one of Messrs. Gwynne's centrifugal pumps, having a separate suction pipe and valve dipping into the water, and its discharge pipe secured to and emptying into the siphon, *B*. To start the siphon, the pump is put in motion by the portable engine, the air-cock is opened, and as the siphon fills with water, all the air is quickly displaced. The air-valve is then closed, and on the chain, *C*, being unfastened, the outer valve will open, and the siphon will discharge water in the usual way and at the ordinary velocity. By keeping the pump at work, however, an increased discharge of water is obtained through the siphon, the increase being in proportion to the velocity with which the water is discharged by the pump. This increased quantity is additional to the actual water forced into the siphon by the pump. By this arrangement the siphon can be made to act even when the water on each side of the hank is at the same level. One pump may be made to charge or fill a number of siphons if placed near each other, and, instead of the portable steam engine, the pump itself can be driven by hand, horse, or any other power, or even by a turbine driven by the discharge from one of the siphons, where the difference in the level of the water justifies such an arrangement.

For keeping low-lying lands, for example those inclosed by dykes, from the accumulation of water from rain upon them, a power to work the apparatus will of course be required proportionate to the rain-fall. A few statistics, therefore, of the rain-fall of different countries will give an idea of the variations in the power required in various regions to maintain a pumping apparatus in operation for a given area. The greatest rain-fall in England in 24 hours may be taken at three inches, and the annual rain-fall at from 20 inches to 70 inches, and the mean may be taken at 42 inches. For London, 24 inches; Rome, 36 inches; Paris, 21 inches; Liverpool, 34 inches; Kendal, Westmoreland, 60 inches; St. Petersburg, 16 inches; Upsal, 26 inches; India—in the plains—from 50 inches to 70 inches, and in the

hills, 130 inches. At the Capo, 23 inches; Tasmania, 25 inches; in the Southern States of North America, about 46 inches. The greatest evaporation in 24 hours in India is about 0.56 inch, and the mean daily evaporation 0.22; the mean daily evaporation in England may be taken as 0.08 inch. In England, drains and sewers should be constructed large enough to carry off one inch of rain per hour—i. e., 60 cubic feet of water per minute per acre, where heavy falls of rain take place, as during thunder storms, etc.

In England it is assumed that for the drainage of fens and low-lying districts an engine of from twelve to sixteen horsepower is sufficient to keep dry a thousand acres of land, provided the lift does not exceed ten feet. Our climate being more

GWYNNE'S DRAINAGE SIPHON.

dry than that of the British Islands, this estimate would doubtless be found within bounds for similar operations in this country.

The land reclamation movements now going on in this State, will eventually call for something of this kind. Indeed, the city of Sacramento has already expended large sums of money for drainage purposes, with a result which we should suppose might have been accomplished at a much reduced cost by the employment of the principle here described. We are indebted to the *American Artisan* for the above illustration.

**DODGE CRUSHER.**—A gentleman in Montana wishes to know the address of the manufacturer of the above named ore crusher. We believe it is made in the Eastern States. As the patentee does not advertise in the mining states, we will publish his address if some friend will find and send it.

**THE GOLDEN STATE Iron Works** are making some large hydraulic and screw presses for the vineyards of Eberhardt and Lachman.

## Reduced Charges for Milling Ores.

**EDS. PRESS:**—The improved methods of roasting ores of late years have led the way to greater progress in milling than the world had made in the last three hundred years; and still the call is loud for inventive genius to step forward and make its mark higher on the scale of advance. In this place the roasting of ores in the old reverberatory furnace costs on an average \$15 per ton; by the Stetefeldt process \$5.45; by the White revolving furnace \$2.30. The miners here have long been asking for a reduction in the charges for milling. The price had gradually fallen from \$80 to \$35, but this did not satisfy the demand, and as one company had purchased the exclusive right to use

first-class mining school where the practical and scientific branches shall be thoroughly taught. Then a graduate of such a school will be able to analyze all the ores and be perfectly versed in the best processes of working them. On this point more anon.

We have here, as there is almost everywhere, a large class of low-grade ores that will not work over \$40 per ton, and are very anxious to see the citizen's mill a success. In the meantime the Pacific Co. has just received another of White's furnaces which is somewhat improved, and they will soon have it running in the Medium mill, where it will be likely to receive good treatment. A report of its result will be looked for with interest. The Manhattan Co. are fortunate in having an excellent mechanic, who, from time to time has been making improvements upon the machinery, so that now their twenty stamp mill reduces thirty tons a day. They have just erected new pans, retorts, and smelting rooms, which does great credit to their worthy engineer. For neatness, convenience, and efficiency, the old Manhattan stands to-day without a rival. A marked feature of the new improvements, is that special regard has been paid to the health of the workmen. A. CHASE.

Austin, Nevada, Sept. 28th, 1871.

**MINING MAP OF UTAH.**—We received from Mr. Froiseth, some time since, a new mining map of Utah, and inadvertently omitted to mention it. It is a very valuable map to those interested in mines in that section of country and is well gotten up. It is drawn on a scale of 4 miles to an inch, showing the Railroads completed and projected, and the line of the Utah Central with its branch to the Cottonwood mines. It shows also the boundaries of 28 organized mining districts, and the locations of a few of the principal mines in each. It is compiled from the latest United States surveys and other authentic sources. This map has been of great use to us in our office and we recommend it to our readers as a very convenient reference. These maps are for sale by Roman & Co., in this city, or by the publisher, B. A. M. Froiseth, Salt Lake City, Utah.

**THE YELLOW STONE COUNTRY,** according to our correspondent W. H. M., is believed to be a fine agricultural, as well as mineral section, but the Indians are so bad that it is unsafe for parties to venture there unless accompanied by soldiers, or in numbers sufficient to protect themselves. The section contains some of the wonders of the world, which we at this late day are just discovering. The Northern Pacific Railroad which will pass through that part of the country, will do much to develop its resources, and give miners a chance to prospect, and tourists an opportunity to visit and explore.

**NOT CARRIED OUT.**—When in Washington in May last, Commissioner Leggett, informed us of the intention of the office to supply each inventor for the term of six months after his patent issued with full copies of all patents, issuing in the same class as his own. We predicted at the time of publishing our notice of such intention, that we did not deem the idea a practical one, and we now have to inform our readers that it has never been carried out by the department.

This mill has just completed its first month's run, but with what success it is difficult to learn. The furnace worked well, if anything, too well, for it turned or partly fluxed the ore. It produced very fine hullion, but for reasons best known to the stockholders it is now standing idle. Rumor says that they have sustained considerable loss. The faults in the construction of the mill are small and can be easily remedied. One would think that it would require acquaintance with this new kind of a furnace, or skill would have to be acquired by making tests in speed of revolution, degree of heat, and both combined.

The fact is, we must have in this State a

## MECHANICAL PROGRESS.

### Destructive Effect of Salt on Axles.

The London papers give accounts of several accidents occasioned by the fracture of the axles of salt cars. It appears that between the sound portion remaining and the outside of the fractured axle the surfaces were quite smooth, presenting the appearance of having been severed by a sharp instrument. This peculiar effect is thought to have been caused by the gradual action of the brine on the metal, the heat at the boss favoring the evolution of chlorine from the brine, and its then combining with the iron to form a soluble chloride of iron. From the position of the defect it was not discoverable by any ordinary inspection; and, whatever may be the scientific explanation of the peculiar destructive action which thus goes on in the axles of salt cars, the fact must be regarded as a very serious one—especially in view of the statement made that on one railway alone, no less than seven axles of salt cars were broken while running, in a period of less than three months, and this out of a total number of about five hundred wagons, showing an enormously large proportion, as compared with the fracture of cars of any other description of rolling stock. To diminish this liability, the plan has been proposed that, in addition to requiring such cars to be provided with well-constructed axles of good quality, it also be insisted that the date of their commencing to run be stamped upon the axles, and that a reasonable number of years be prescribed as the maximum of their being used.

**A NEW AND VALUABLE PAVEMENT.**—Prof. Wurtz, of Mass., recently introduced to the scientific world a new asphaltic pavement, under the name of Grahamicite. It was subjected to severe tests in the presence of eminent engineers. The experiments proved that it would stand a pressure twenty times greater than that required to crush granite. It was exceedingly tough and slightly plastic. From recommendations made by gentlemen who witnessed these experiments, a pavement of about two hundred feet in length was ordered to be laid on the Battery, from the foot of Whitehall street to a point opposite the wharf, where heavy stones used in building the Post Office are unloaded. The pavement was finished several weeks ago. Since then enormous loads of stone have been drawn over the pavement, during the most trying part of the year. The more it is used the harder and smoother it becomes. It is gray in color, and clean and pleasant to the eye. It can be made to stand a heat of 500 degrees without softening. In the sunshine the pavement was so hot that it was painful to hold the palm of the hand on it. Hard blows were struck with a heavy hammer in the face of the composition. It was like pounding a well-seasoned slab of sole leather with a broad-headed hammer. It is claimed that this pavement is the cheapest and most durable ever invented. Thousands of yards can be laid in a day.

**THE FUTURE IRON CENTER OF AMERICA.**—Dr. Gustav Kluppel, an eminent German metallurgist, has been examining the iron works of America and reporting his observations in a German technical journal. He ridicules the anxiety of American ironmasters for pure coal, feeling confident that the ordinary bituminous coal of the West as well as the East would be available for use in blast furnaces if properly coked. Of the natural advantages of St. Louis and vicinity for iron manufactures, he says:—"As the railroad bridge over the Mississippi, opposite St. Louis, will be completed within a year, there is nothing in the way of the iron manufacture, including the blast furnaces, settling near East St. Louis in the immediate vicinity of the coal mines. Here both coal and ore are to be had cheaper than in Westphalia, for instance; and as St. Louis, in relation to England, possesses a natural protective tariff of \$8 to \$9 per ton, (\$4 to \$5 more than the Atlantic States), it may well be affirmed that here is the soundest foundation in the country for all branches of the iron manufacture, from pig iron to Bessemer steel.

The ivory keys to pianos or melodeons, when yellow, may be rendered white again by sponging them with diluted sulphurous acid and exposed to the sun.

### A New Partition Wall.

A new kind of wall is coming into use in England, the advantages claimed for which are the very important ones of non-absorbency of moisture, non-conduction of heat, economy of space, a washable surface, and, withal, cheapness. Over a framework of strong cross-wires, of about one-eighth of an inch in thickness, there is woven, by a powerful pressure, fibrous matter, which is saturated with a solution that renders it fire-proof. It is then subjected to a very powerful pressure. A coating of light Scott's cement is then put upon it for inside facing, and of Portland cement for outside facing. By this means surfaces are made impermeable to moisture, smooth and easily washed with water, thus saving the expense of repeated lims washings. It is formed into slabs in iron frames, which are put together and closely and securely fastened with bolts. The slabs are from one and half inch to four inches thick. They serve as superior paneling for dividing walls and partitions. Where space is of importance, it has the advantage, perhaps, over concrete walling, in enabling a wall to be made of not more than one and a half inch or two inches in thickness, and yet its quality is said to greatly deaden sound.

**THE LIFE OF A LOCOMOTIVE.**—In regard to the durability of English railway work, it is stated that the life of a locomotive boiler has been found to be about 350,000 train miles, and on some lines this has been extended to four hundred and even five hundred thousand miles. The wear and tear depends of course greatly on local circumstances, and particularly on the chemical qualities of the water employed. Assuming that the life of the engine is determined by the endurance of the boiler, and that under favorable circumstances it will last five hundred thousand miles, then, during that time, the fire box will probably require renewal at least three times, the tires of the wheels five or perhaps six times, the crank axles three or four times, and the tubes from seven to ten times, with the best possible material and construction presumed to be used in each case. Similar statistics from the life of American locomotives would be of interest. In one case lately published, that of a locomotive on the Pennsylvania Railroad, built by the Baldwin Locomotive Works, we believe actual data gave the number of miles as exceeding the amount stated above.—*Iron Age.*

**MODEL RAILWAY MANAGEMENT.**—On the Michigan Central road, for over 16 years past, not a drop of blood has been drawn from man, woman or child inside the cars, and just now the *modus operandi* is especially important. At all hours of the day and night there sits an operator in the Kalamazoo station (midway of the line), who receives telegrams from each train on the road the instant it enters or leaves a station, so that he holds or starts it at will. His eye is literally making a collision next to an impossibility, and the immense single track quite equivalent, so far as safety is concerned, to the double track roads. The 12 and 16 wheel coaches, admitting of the breaking of any one of the wheels without disabling the track, constitute also no small item in this aggregate of immunity from peril.—*Railway Times.*

IMMENSE quantities of cast iron nails are manufactured in Staffordshire, England. Over a 1,000 tons of iron are annually consumed for this particular industry. The appliances for casting are so well perfected that one hand can produce 750,000 nails of the smallest size in a day, while 52,000 of the larger size can be made in the same period. The mold contains large numbers of connected forms for the nails, and the latter hang together when removed therefrom, and are broken apart. They are subsequently tempered in oxide of iron and made malleable.

**NEW PROCESS FOR SILVERING MIRRORS.**—A plate of glass measuring 100 superficial feet was recently silvered at St. Helier's Lancashire, England, by a new process, by which the mirror was completed in forty hours, instead of ten days, which would have been required according to the old methods. This mirror, it is stated, is the largest ever manufactured in Lancashire, and with one or two exceptions, the largest ever made in England.

**ACTION OF FROST ON RAILS.**—Contrary to popular belief, a technical journal says, steel rails are less effected by frost than are iron ones. The Grand Trunk Railway, after five years' trial of steel rails, laid sixty miles of them last year, which have stood well. This year eighty-five miles more are to be put down.

## SCIENTIFIC PROGRESS.

**THE ANALYSIS OF TEA.**—Tea contains several characteristics, which are seldom taken into account, in addition to its usual 5 per cent. of them or thereabout. Iron forms a very important constituent, as does also manganese and potassa. The leaves of the tea plant give about 5.63 per cent. of ashes, of which 4.04 are soluble from the leaf and may be found in the extract. The extract therefore is very rich in inorganic compounds; especially in phosphoric acid, but they contain only a little potassa. Old tea leaves contain much lime but little potassa and phosphoric acid. Of a young tea more than  $\frac{1}{2}$  will go in the extract, of old leaves much less. The above observations are the result of some recent investigations as reported in *Annalen der Chemie.*

**NEW PROCESS OF OBTAINING A CEMENT WITH THE SCORIE OF BLAST-FURNACES.**—One part of these slags in fine powder is sprinkled and agitated in a suitable vessel, with two parts of an equal mixture of hydrochloric acid (35 per cent. HCl) and water. The slags decompose, a lively disengagement of HS taking place. The mass finally forms a thick jelly, from which water removes the chloride completely. After removing these, the residue is dried and reduced to an impalpable powder; one part of this powder, intimately mixed with 9 parts of slag in powder, gives an excellent cement in water or air as it may be desirable to apply it. The composition of the slags from which the best cement is obtained should be about as follows:—Essential elements—Silicic acid, 40.28; clayey earths, 15.13; calcareous earths, 36.24; non-essential elements—manganese, oxide of iron, alkalies, etc., 8.35=100.

**PHOTOGRAPH PRINTING IN COLORS.** is effected by mixing the colors with a solution of bichromate of potash, spreading the color thus mixed over the surface to be printed, and exposing it to light under the negative. The spots where the color is not fixed by the decomposition of the bichromate, may be washed off, of course as many negatives must be used as colors are intended to be used, and the parts which are not to receive any of a given color, are to be carefully covered in the negative for that color. This process may be used on textile fabrics, glass, etc. The articles to receive the picture should be covered with a varnish of gum damar in benzine, to which a little alcohol has been added, to prevent cracking.—*Philadelphia Photographer.*

**EFFECT OF AN ECLIPSE OF THE SUN ON THE MAGNETIC NEEDLE.**—It is a well known fact that the magnetic condition of the earth is disturbed during displays of the Aurora Borealis, and is manifest from the irregular movements of the magnetic needle on such occasions. Other extraterrestrial causes may also produce similar disturbances. It was observed on the 22d of last December that the magnetic needle followed its usual course till the commencement of the solar eclipse which occurred on that day. With the beginning of the eclipse it retraced its steps until it reached its minimum declination at 1 hour 58 minutes, which was the instant of totality. From that moment the ascending motion toward the west began anew, until the needle had regained the exact position it had occupied when the eclipse began.

**VINEGAR FROM WINE.**—It having been observed that wine when left to stand in contact with the air, usually turns to vinegar after a certain lapse of time, but the water in which a little alcohol has been mixed never became vinegar, though exposed to the same conditions; M. Pasteur has recently made researches on the subject, and discovered that this change is due to the presence of a small plant in the wine—the *Mycoderma Aceti*. Taking advantage of the knowledge of this fact M. Breton Langier has instituted a large vinegar factory in which, bearing the fact carefully in mind, vinegar can be made more rapidly and cheaply than before.

**ARTIFICIAL AZURITE.** has been formed by Messrs. Wehel & Tuengel, by enclosing gypsum and the green carbonate of copper in sealed tubes for several months. Intensely blue crystals of azurite, together with crystals of sulphate of lime were obtained.

**ANALYSIS OF CUNDURANGO.**—The new plant—whose extract or decoction is said to effect such wonderful cures in cases of cancer, has been analyzed by Dr. Antisell, chemist to the Agricultural Bureau at Washington. The doctor finds this ratio of the wood to the bark to be as 50:28 to 49:72. The centesimal composition of this bark was as follows: Moisture expelled at 212 Fah., 8; ash matters or mineral salts, 12; vegetable substances, 80. The vegetable matters were separated and found to be composed as follows: Fatty matters, soluble in ether and partly in strong alcohol, 0.7; yellow resin, soluble in alcohol, 2.7; gum and glucose from starch, 0.5; tannin, yellow and brown coloring matters (extracted) 12.6; cellulose, lignin, etc., 63.5; total, 80. No crystalline alkaloid could be detected, and according to the above results, the therapeutic position of the plant must be among the aromatic bitters.

**ROARING OF AURORA BOREALIS.**—M. Becquerel read, at one of the last meetings of the Academy of Science of Paris, a paper on the Celestial Origin of Atmospheric Electricity, and he concluded by stating that the auroras result from discharges of this electricity, and thus he explained the roaring, more or less loud, heard by the inhabitants of polar regions. Most scientific men deny the occurrence of these sounds, but M. Becquerel, in support of his opinion, quoted the observations of Paul Rohrer, aeronaut, who started from Paris in December last, and descended 14 hours after in Norway, on Mount Ide, at an elevation of 4,000 feet: "I saw through a thin fog the moving of the brilliant rays of an aurora borealis, spreading all over its strange light. Soon after an incomprehensible and loud roaring was heard, which, when it ceased completely, was followed by a strong smell of sulphur, almost suffocating.

The doctrine that a uniform temperature of thirty-nine degrees prevails at a certain and considerable ocean depth is fast being abandoned, in consequence of the recent researches of Dr. Carpenter and others. It was supposed to derive support from the thermometric observations made in Sir James Ross's Antarctic expedition. Since then, however, it has been conclusively proved that no ordinary thermometers, such as the instruments with which those observations were made, can resist the pressure amounting to a ton upon each square inch, for 800 fathoms of depth to which they are subjected, in deep-sea soundings. Thermometers, protected by a simple arrangement devised by the late Professor W. A. Miller, whereby a pressure of even three tons to the square inch would produce no perceptible effect, are now used.

**FLOATING OF SOLID IRON ON MOLTEN IRON.**—The following explanation seems reasonable, and is accepted by many foundrymen and others. According to the dynamical theory of heat, the molecules or particles of heated metals are in a state of great agitation, and the higher the temperature, the intenser the molecular motion. The difference in the specific gravity of melted and solid cast iron being slight (as 31 to 32 nearly,) this constant and fierce movement of the particles of the former, prevents a block of the latter from sinking. An analogous action is found in swift running streams or eddies, upon which bodies of considerably greater gravity than water are supported for a long time and also in the partial suspension of an egg in boiling water.—*Scientific American.*

It has been asserted by some scientists that animals do not suffer so much under parallel injuries as man. Horses so badly hurt that their leg bones have been found protruding through the skin, and actually in contact with the ground as they walked along, having been known to begin to graze almost as soon as they were left to themselves. Of course in such a case the horse must feel some pain; but it must be immeasurably less than that which a man would suffer in a like condition. We cannot, for instance, believe it possible that a man could sit quietly down to dinner just after having his leg broken; yet that would be a parallel case.

**TEST FOR GALVANIZED IRON.**—When zinc is deposited on iron by galvanic agency, it should form a chemical combination with the iron, and not be merely attached thereto. It is proposed by Mr. T. Bruce Warren, of England, to use this fact for practically testing the efficiency of the galvanization. If mercury be poured over the surface, the zinc that is only locally attached will form an amalgam with the mercury. Mr. Warren also uses this as a quantitative test, to verify the amount of zinc in combination with the iron.

# CORRESPONDENCE.

## SAN DIEGO MINES.

EDITORS PRESS:—I cannot at present give you anything like an elaborate report of mines in this county, as it would take more space in your paper, and more time than I could afford. Suffice it to say, that after having 18 years' experience in quartz mining in the States of California and Nevada, and many of the Territories, that there are richer mines, and more of them, in the Banner and Julian Districts, than I have ever seen in the same number of miles in any other country.

The formation of the country rock, and the veins of quartz show a peculiarity not found elsewhere. The country rock is talcose-slate; but in many of the mines, granite forms the foot wall and slate the hanging wall; such is the formation of the

### Golden Chariot.

one of the richest mines that I have ever seen. A run of 30 tons, imperfectly worked in the McMechan mill, paid \$154 per ton. The above mine has been opened by a shaft about 90 feet, showing a well-defined vein of quartz, from 2 to 4 feet wide, that will undoubtedly pay \$200 per ton when practically worked. The vein is opened in many places by open cuts and shafts, which prove, beyond a question, that it is a permanent fissure vein. I am informed that the owners intend erecting reduction works in a very short time.

### The Ready Relief,

owned by the Bailey brothers, is very much like the Gregory mine in Colorado. The only difference that I see is, the Gregory is in granite, while the Ready Relief is in slate. The same class of ore predominates, containing pyrites of iron and copper; antimony, arsenic and plumbago. The above mine is well located for working purposes, and they are now running a tunnel which will tap the lode 300 feet below the surface. There are also good facilities for milling, there being a fine stream of water, high enough to supply the mill tanks without pumping, and the same power will do the milling and hoisting from the mine. The vein is from 2 to 4 feet wide, and the indications are that it will increase in size at a greater depth. The ore from the above mine is very refractory, and needs roasting. By roasting in bulk before crushing, which was done imperfectly, it paid in an arrastra an average of \$28 per ton.

### The Redman Mine

joins the Ready Relief, and is of the same formation. The vein at the depth of 80 feet is stratified, but from appearance will concentrate, and form a wide and permanent vein. The same difficulty occurs in working the Redman ore, that I have mentioned regarding the Ready Relief, and consequently it is worked with little profit to the owners.

### The Kentuck

mine is yielding the richest ore that I have seen for years. I was shown specimens yesterday by Mr. M. A. Lewis, the Supt., which weighed from fifty to one hundred pounds, which were spangled with free gold. The vein is from one to three feet wide, and is a valuable mine.

### The Antelope Company

have struck the main lode, which is yielding very rich ore. The mine is worked by shafts and open cuts, and in every place, shows a rich, and permanent vein. The company have kept their five stamp mill running, and notwithstanding the difficulties which they had to contend with, in opening up their lode, building mill, etc., the mine has paid for all, now being in good shape to take out ore. I am in hopes ere long, to see them rewarded for their industry, and perseverance.

### The Madden Company

are also taking out rich ore. Foul air has prevented work upon this mine for a few days, but they have managed to counteract it, and will resume work this week. There are many other mines which I would like to mention, but space prevents me from doing so this time. I hope ere long to see men of means take hold of mines in this county, which will, when properly worked, pay as large dividends as any in the State of California in proportion to the investments required to develop them. All that is wanting to make the mine in this locality a success, is the proper machinery to work the refractory ores and practical men to work them judiciously. J. M. T. Banner Dist., Sept. 27th, 1871.

## About the Loss of Quicksilver.

EDITORS PRESS.—The proposition of A. B. Paul, published in your issue of Sept. 23d, is no doubt a generous one and made in good faith; but there are several reasons why he or the public will not be likely to realize much from such an arrangement as his offer indicates.

In the first instance, those whose experience is of any value will be likely to consider over so little time worse than thrown away, if it unlocks their particular knowledge-box, for gratuitous information. A. B. P. knows, and if he is half as astute as he appears, that this is particularly the age of jockeyisms, and any mining or milling expert will have a quiet laugh to himself at the idea of relinquishing his particular secret, or tit-bit of experience, that has any economical bearing upon the working of ores by the use of quicksilver.

The writer of this, at one time, worked Savage and Gould & Curry ores, in competition with other millmen, and succeeded in making a saving in excess of any of the competitors; but making no secret of the processes used by underhand manipulations, the promised preferment was lost, and others with less scruples got the rock to work. Again, when the Gould & Curry mill was working fourteen dollar ore, he saved from their tailings with his own unassisted labor, in six months' time, over \$10,000; but did the skill or experience required for such an operation avail anything with capitalists or mill-owners? Not much! They only ridiculed the idea of a poor laborer teaching them anything.

Fortunately or unfortunately, as the case may apply, the writer has learned that there is something of as much value as capital, and that is the life and health of the working man.

It has often pained the writer to see the waste of health and vigor in the saving of so base a substance as quicksilver. How many thousands of poor wretches are incapacitated from the useful labor yearly by inhaling the fatal fumes from roasting ores, and in the retorting and amalgamating departments of metallurgy?

The proposition of A. B. P. reminds us of a little fabulous circumstance that may or may not apply.

There are hundreds of sharp jockeys who are ready to pay a medicine of the value of any undeveloped "Flora Temple," or "Captain Jinks," that the unsophisticated owner may be willing to warrant to "sweep the stakes;" but when A. B. P. gets 24 others to make a clean breast of their hard-earned, and dear-bought experience in the savings of the metals, the writer solemnly pledges himself to go and do likewise. F. M. S.

## Decision Respecting Trade-Marks.

A suit involving interesting legal points respecting the present law of trade marks, was recently decided in the Equity Court, for the Washington District. It was instituted by Joseph Rodgers & Sons, the celebrated cutlers, of Sheffield, England, against Phillips and Solomons, the stationers who have the contract for supplying the Treasury Department with Rodgers & Son's penknives, erasers, etc. The complainant alleged that the defendants had been selling imitation knives bearing the counterfeit of their trade-mark. The defendants did not deny the sale of these imitation knives, but alleged that they were manufactured in Germany by a firm known as Rogers & Sons, who have a Royal license from the Prussian Government for a trade-mark similar to that of Rodgers & Sons of England, and have long been imported and sold in this country. They furthermore contend that plaintiffs cannot maintain their suit, in view of the fact that they have not registered their trade-mark in the U. S. Patent Office, as provided for in the Act of Congress on the subject, passed in July last. A decision was rendered overruling and denying an injunction as prayed for by the plaintiffs, on the ground that the English firm had, by their neglect for a series of years to enforce such rights as they are possessed of, under the trade-mark law in this country, waived the right to call upon the courts for assistance. The firm which made the cutlery had also a right to use the trade-mark in Prussia, where the goods were manufactured.

## A Philosopher's Stone for Employers.

It is said that John Randolph once rose suddenly up in his seat in the House of Representatives and screamed out at the top of his shrill voice: "Mr. Speaker! I have discovered the Philosopher's Stone. It is—Pay as you go!"

In all the searches after the Philosopher's Stone, we know of none more successful than this. In all the walks of life nothing more true or valuable can be said than "Pay as you go."

We propose, at present, to apply this merely to the case of employer and workman. Between the two arise many a trouble from many a cause. It is often very difficult to say which is in the right. Frequently, as in all other things, the right is on both sides. But the opinion of the world is apt to favor the employer in the generality of cases.

The workman always has many reasons, stronger or weaker, for complaint. And one of these, only too often, is delay or failure to pay his wages. We often hear the folly and wickedness of strikes dwelt on. Concerning this subject we do not wish now to argue. We merely assert that the employer has no more right to delay paying his men's wages, when due, than the men have to strike and prevent others from taking their places.

We doubt not that many a strike has had its origin, in part, at least, in a delay of the pay which is due the men. We know of many a case on this Coast, as well as elsewhere, where the miner, farmer or mechanic cannot obtain his dues from his employer. If a man cannot pay his workmen, he has no right to engage their services, and cannot complain, in justice, if they take action to secure their rights.

When a workman's wages fall due, they are his property. To withhold them is therefore only one species of robbery, where the law cannot be applied to without injury to the employer. The man often cannot appeal at all, without danger of permanent injury to himself; often social opinion would deter him from attempting to secure his rights. And so he is obliged to suffer without any redress.

The labor question is getting to be an important one now-a-days. Both sides should be heard and judged impartially, and we think that this one item should receive more attention than it has. Whereupon we call upon employers to think of Randolph's Philosopher's stone—Pay as you go!

**SALMON THINNING OUT.**—It is said that the supply of salmon in the Sacramento is perceptibly diminishing. In past years fishing-boats would bring in as the result of a day's labor from a score to a hundred fish, but now from eight to a dozen is the limit; that the fish caught are principally females, filled with spawn, on their way to headwaters to deposit their eggs. Why should not the protection of the law be accorded to the salmon as well as to trout and mallard ducks? From June to November, at least, it should be prohibited to capture salmon fish else soon these prized and nourishing finny invaders in California's greatest river will disappear. What representative of a river county will first move in this matter of growing importance—the preservation of internal fishery interests?

**THE CALIFORNIA COTTON GROWER'S ASSOCIATION** recently appointed a committee consisting of Messrs. James D. Johnston, Robert Plunkett and James B. Johnston, to visit and examine a tract of land, near Bakersfield, in Kern county, offered to the Association as suitable for their proposed cotton plantation. The committee having visited and examined the same, and reported favorably upon its adaptability for the purpose proposed, the Association will undoubtedly locate there.

Bakersfield is located upon what is known as Kern Island, a rich and well watered region, some 80 miles below Visalia, and about 328 from this city, with which it will soon be put in direct railroad connection. Upwards of 20,000 acres of land will be included in the purchase. The successful issue of the Merced cotton experiment, will do much to give confidence to this new operation.

## BOOK NOTICES.

**How to GET RICH.**—A Pamphlet by Uncle Ben. 28 pages. C. M. Cornwell, 247 Pearl St., New York.

This little pamphlet was written for the express purpose of showing beginners in life the one way by which they may become rich. We say the one way, because it is the only way which is open to all and in which there is no necessity for failure. In ordinary business pursuits all men cannot succeed. There are always some lacking in ability; some who never seem to rise. In other occupations the general opinion is that the third or fourth rate man must be content to remain poor. Nobody expects laborers to become rich or even to accumulate a competency for old age. But "Uncle Ben," in this pamphlet, shows how every one who has common sense enough to earn a living, may in time, by properly employing the saving banks, gain sufficient wealth to at least furnish a comfortable income for old age.

In proof of the correctness of his views, and to show how easily the thing may be done, he points to his own case. Fifteen years since without a penny in the world he began to make his way in New York with a modest salary. From the beginning he began to make a weekly deposit in the savings bank, and now his income from the money so deposited is greater than the salary he received when he first came to the city. The figures which he presents are startling, showing as they do how perfectly simple it is to obtain enough to satisfy any man of reasonable desires.

For instance, if between the ages of 20 and 60, a man puts a dollar per week into the savings bank, he will at the end of that time have \$8,413.12, which invested at seven per cent. would give about \$50 per month. In California banks, amounts would be nearly doubled, as the above figures are calculated for six per cent only.

If this little pamphlet would be circulated all over the country it would be of immense value to all classes. Could our boys be taught the proper use of the savings bank there would be very few of them, who at attaining their majority would not have sufficient money at least to go into business for themselves.

Men in New York city, who have this matter at heart have made arrangements to distribute these, as tracts, everywhere. The saving banks all over the country, are buying them for gratuitous distribution and are thus helping along the work. The pamphlets are sold at \$75 for 5,000 copies, just about the price of the paper and printing. This also includes pinning one page of advertising for the institution ordering.

We feel the greater interest in this matter as it has been taken up entirely from benevolent motives and without expectation of pecuniary reward. The first edition, together with the printing and electrotyping, was entirely at the author's expense, being, as he termed it, a sort of thank-offering for his success in life. We understand that the printer fills orders for any quantity at the price we have named.

**The American Odd Fellow** for September is upon our table. Though it is the organ of the great secret society whose name it bears, yet we find in it a great deal of rich and spicy matter of interest to the general reader. In typographical appearance it ranks with the first in the country. The magazine deserves a large circulation, not only within the order but among the outsiders. It is published by the American Odd Fellow Association, 96 Nassau Street, New York.

**THE ALVARADO BEET SUGAR Co.** have commenced digging the second crop of beets, and the work of sugar making from the native product is now well under way again. According to the *Alta* the supply of beets will this year reach 800 tons (16 tons to the acre). The juice has been tested and found to yield most satisfactorily. The amount of sugar made last year was only 500,000 pounds. This year it is expected to reach 1,125,000. This will occupy the mill about five months; the balance of the year will be occupied in refining imported sugar.

## MINING SUMMARY.

THE following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

### California.

#### ALPINE COUNTY.

**BARNES-BURROUGHS' MINE.**—*Alpine Chronicle*, Sept. 30th: This is located in Hope Valley and is better known as the "Billy Bodger's," and Hope Valley. E. Barnes, of Petaluma, having purchased the interests of his partners has sold an interest to Dr. Moore, of S. F. Last week 16 men commenced building roads, cutting, wood making coal pits, etc., preparatory to resumption of work on the mine. Machinery for hoisting works is on the way from Reno, and will be at the mine in a few days. A large force will be put on as soon as the present work is finished. This is a silver mine, and the ore, by mill process pays well.

**SUSPENDED.**—Work on the Glohe has been suspended for a few days, awaiting the arrival of a more powerful pump, daily expected.

**MONITOR MINER.**, Sept. 30th: The Exchequer has several hundred tons of pay ore out which will soon be run through the mill. The Monitor mill will soon have stamps in and he pounding away on pay ore, the mine being fully able to keep it supplied from the start. The Glohe mine is to have steam hoisting works put on at once, which will enable this company to go down on the ledge and take out its rich copper ore. The Schenectady mill will be enclosed here for stormy weather sets in, and employ a large force all the way through.

#### CALAVERAS COUNTY.

**SALE OF A QUARTZ MINE.**—*Calaveras Chronicle* Oct. 7th: A controlling interest in the noted "Poe" mine, at Railroad Flat has been sold to Adams & Co., of Sacramento. The terms are these: Adams & Co. are to have full control of the lead, erect the necessary machinery and thoroughly develop the mine, Mr. Poe retaining a third interest. The ledge, so far as prospected, has proved a good one. A shaft has been sunk to the depth of 80 feet, the rock taken from it is paying well.

**CORRAL FLAT.**—Champion Co.'s claim is paying between 7 and \$8. per day to the hand.

**AN OLD MINE REOPENED.**—Recently work has been commenced in the tunnel claim on the western face of the Stockton Hill, known as the "Ruthroff mine." The tunnel is about 1,100 feet in length.

**THE UNION COPPER MINE.**—*Stockton Republican*, Oct. 4th: The prospects are that work on a large scale will soon be resumed at the Union Copper Mine, Copperopolis, a gentleman having gone east to make an arrangement to that effect with the owners.

#### EL DORADO COUNTY.

**ANOTHER QUARTZ MILL.**—*Marysville Appeal*, Oct. 8th: The St. Lawrence Co., of Georgetown, are about to erect a 20 stamp quartz mill, with double hoisting works, at their mine. The contract has been given and the work has already been commenced. Two engines, one of 30 and one of 60 horse-power have been contracted for, together with the hoisting works, with everything complete, including the latest and most approved machinery for working the rock.

#### MARIPOSA COUNTY.

**RICH POCKET.**—*Mariposa Gazette*, Oct. 6th: Morgan & Co., last week struck a pocket in their quartz claim near Hornitos, which yielded them \$3,000. These rich strikes are getting to be quite common around Hornitos.

#### NAPA COUNTY.

**MINING CO. ORGANIZED.**—*Calistoga Tribune*, Oct. 5th: The Calistoga Quicksilver M. As. organized on the 28th of Aug., have elected the following officers: Pres. W. Patterson; Treas., J. A. Chesbro; Sec., W. P. Litten. Directors—A. C. Palmer, J. A. Chesbro, and Wm. Patterson. The object is to work a quicksilver mine in the Lake M. Dist., about 10 miles from Calistoga, on the north side of St. Helena Mt., near the Mt. Mill House. The mines are now being worked, and a tunnel has been run a distance of 70 ft. The ore taken out thus far is exceedingly rich—large quantities of quicksilver being obtained. The ledge appears to be well defined.

#### NEVADA COUNTY.

**HOISTING WORKS BURNED.**—*Nevada Transcript*, Oct. 7th: The works and buildings of the Manhattan M. Co. on Gold Flat, were totally destroyed by fire on Thursday night. The fire caught from a spark from the smoke stack and spread very rapidly.

The horse and a quantity of wood were destroyed and the engine burned. The loss is \$1,500, upon which there is no insurance.

**THE EUREKA MINE.**—The mine was shut down for the annual repairs to the incline and tunnels. It is expected the mine will be ready for work again in a week or ten days.

**GOOD ROCK.**—The Orleans at Gold Flat are getting out some excellent quartz in the lower level of the mine. The ledge is well defined, and the prospects of the company are excellent.

**A NEW LEAD.**—*G. V. Union*, Oct. 7th: Hunt and Talbot, were fortunate in striking a ledge in the vicinity of the Seven Thirty mine a short time since—which promises well. Nine loads of rock crushed at the Gold Hill mill yielded \$1,300, or \$145 per load, and another crushing will soon be made, the rock showing as well in gold as that already worked.

**KNIGHT OF MALTA LEDGE.**—*Caruana & Co.* are working on the Knight of Malta ledge, with good prospects of developing a paying mine. The ledge has been sunk upon a distance of about 40 ft. and a drift, at that depth, has been run eastwardly for 20 ft. The ledge in the drift is strong and bears mineral heavily. We saw some specimens which show well in sulphurets and also in free gold. The ledge in the drift is not less than 3 ft. thick in any part, and in places it is 6 ft. thick. The company have now on the surface of the ground about 20 tons of rock. The St. John Quartz M. Co., as the Co. working the ledge is called, has been prospecting for about 4 years in the vicinity of the Knight of Malta ledge.

#### PLACER COUNTY.

**QUARTZ MILL BURNED.**—*Auburn Stars and Stripes*, Oct. 5th: The Empire quartz mill, located between Ophir and Doty's Flat, was destroyed by fire last week. The fire was the result of incendiarism. A new steam fire engine of 30-horse power had just been set up in the mill, which escaped from the fire with slight damage. A man named Truesdale, was badly burned about the upper portions of his body, so as to require medical treatment. The destroyed property was owned by the St. Patrick Co.

**GOLD DUST** to the amount of 84 ounces, valued at \$1,575 was shipped on Monday last from Michigan Bluff, to W. H. Watson, Sec. of the Yule Gravel Co., San Francisco, said sum being the yield of the above named claim for the week ending Sept. 30th, with 8 drifters and 2 carmen at work, and a draw-back of a considerable percentage of what is known among miners as "dead work"—i. e. in "squaring up," "straightening track" and the like. Owing to these draw-backs, the above yield represents but 52 days' work in the actual operations of taking out and washing pay dirt, which is over \$30 per day to the hand.

#### SIERRA COUNTY.

**INDEPENDENCE MINE.**—*Grass Valley Union*, Oct. 4th: A sale of this old mine, situated at the Downieville Buttes, was made, a short time since, for a valuable consideration, to an English Co.

#### TRINITY COUNTY.

**WEAVERVILLE JOURNAL**, Oct. 7th: Silcox is running his quartz mill on Indian Creek and reports the prospects as very flattering, and improving.

**CANON CITY.**—Cor. same: P. Slattery has taken a contract to dig a ditch 20 miles in length from the little East Fork of Cañon Creek to Hyke's Hill, for D. McElduff, and intends to have it done by the time water comes.

**C. Dannin** is getting a very large lot of iron pipe to lay across Red Flat for hydraulic purposes, and will have some 250 ft. pressure. This claim is 80 or 100 ft. in depth, and is a good paying one.

**J. A. Burger** has finished sluicing for the season, and has so far taken out \$8,000 and has not cleaned any bed rock. This claim is from 20 to 60 ft. deep, and pays all over it.

**Wilt & Porter** are still sluicing. **Murphy & Mathewson** have found better prospects than they have had for years.

### Nevada.

#### COPE DISTRICT.

**RAILROAD DIST.**—*Elko Independent*, Oct. 7th: The Hussey tunnel has tapped several veins of good ore from which shipments are made. From Last Chance, copper shipments of ore for several weeks have been steadily on the increase. The Lee mine is a perfectly defined lode, in which over 4,000 tons of ore are now in sight.

**COPE DIST.**—The Independence and Ku Klux show as fine a large body of ore as was ever milled. The Independence crushed 8 tons from the top and realized \$25,000. Two mills in Mt. City are running on ore from Bull Run dist.

**COAL.**—Negotiations are pending for the sale of the property of the Penn. Coal Co., situated about 30 miles to the north-east of Elko.

#### EUREKA DISTRICT.

**OFFER REJECTED.**—*Eureka Sentinel*, Oct. 6th: The owners of the Golden Gate mine have refused a large offer for it. Capital desired to purchase. Negotiations are now pending with a view towards its sale.

The furnaces are in full blast and the hullion is rolling out in large quantities.

**METROPOLITAN MILL.**—A considerable portion of the machinery is on the ground, and the balance will be delivered in a few days. The work will be completed and in running order by the 1st of Dec. The mill is to have 3 batteries carrying each 5 stamps.

**STRIKE.**—A rich strike has been made by one of the owners of the Enterprise mine, near the head of N. Y. Cañon. Samples of the ore assayed \$208.82 silver, and \$118.04 in gold. The vein is about 7 ft. wide, and gives evidence of permanency.

**STILL IMPROVING.**—The body of ore recently in the Adams & Farren portion of the Co.'s property, is widening and improving as explorations are extended.

#### ELY DISTRICT.

**BULLION.**—*Ely Record*, Oct. 6th: For the quarter ending Sept. 30th, the shipments were \$996,500. For 4 days ending Oct. 5th the shipments were 23 bars valued at \$56,913.01.

**ASSAYED.**—J. Cahill has assayed, from Sept. 14th to 29th, for the Raymond & Ely Co., hullion valued at \$82,637.90.

**RAYMOND AND ELY MINES.**—The immense body of ore struck in the Lightener shaft, on the Panaca ground, still continues to improve as the developments proceed. At present there are 250 tons of first-class ore on the dumps, which will mill an average of over \$300 per ton. The steam engine, to be used in hoisting at the above shaft, is on the way and will be in position and running before the end of the month. Sinking is going on in both the Burk and Creole shafts, and in the former a good streak of ore is making its appearance. The proceeds of the mill for Sept. are over \$200,000—\$10,000 to the stamp.

**WASHINGTON.**—The Supt. has purchased all the Washington ground—600 ft. and is at work upon it. Indications are flattering in the extreme.

**LILLIAN HALL.**—The work on the located shafts has been commenced and is pushed rapidly forward. Indications are extremely good.

**AMERICAN FLAG.**—Work will shortly be resumed. The mine is one of the finest in the dist. so far as developed.

**MEADOW VALLEY EXTENSION.**—Everything is looking remarkably well and prospects are flattering. There are about 1,000 tons of rich ore on the dump, but none has been crushed, owing to the scarcity of milling facilities. The shaft is down 300 ft. and prospecting is going on at the bottom and on the 200 ft. level with promising indications in all newly opened places, and a good ledge in all the different openings.

#### HUMBOLDT.

**BULLION SHIPMENT.**—*Unionville Silver State*, Sept. 7th: The amount of hullion shipped from the Arizona mine, since our last issue, was \$7,729.

**SHIPPING ORE.**—*Marrietta M. Co.* in Central dist. will ship next week 10 tons of ore to San Francisco.

**PROSPECTORS.**—The Humboldt and adjacent ranges of mountains are swarming with active, eager prospectors. From the results thus far achieved it is safe to say that the year 1871 will prove far more satisfactory, in the general progress and development of our mineral resources than that of any year that has preceded it. All the old mines, which were discovered and located in the early days of the Humboldt mining excitement, most of which were afterward abandoned, are now being again relocated and work resumed where it was left off years ago. In a large number of cases where work has been resumed, but a small amount of labor has been performed, when the most astonishing results have followed.

**GALENA.**—During the past 6 weeks work has been vigorously prosecuted in the Monitor mine. The vein commences 30 ft. from the surface, and is of uniform thickness to the bottom of the shaft—a distance of 30 ft.—making the shaft 60 ft. deep.

**BRUNSWICK.**—*Carson Register*, Oct. 6th: Work on the new Brunswick mill, ditch and dam is progressing rapidly; 52 carpenters are employed. The new dam is nearly completed. The capacity of the ditch has been increased about 60 per cent., and the

canal will, when completed, (within 2 weeks) carry enough water to drive 55 stamps.

#### REESE RIVER.

**RICH STRIKE.**—*Austin Reveille*, Oct. 6th: A new discovery has been made about 4 miles from what has been known as Jefferson Dist., about 12 miles from Belmont.

The formation in which the new ledges are found is porphyry, on the west of which is slate. The largest ledge yet discovered is called the Jefferson. The ledge dips to the east gradually, and is fully 15 ft. in width. Assays from the croppings have run from \$320 to \$1,600.

The Prussian, near the western slope, of the same ridge, is 4 ft. wide where the croppings have been broken, and a specimen from the croppings assayed \$1,900. Many other ledges have been located and are reported to be fabulously rich.

**YANKEE BLADE.**—Forty chloriders are at work in this section, nearly all getting good ore.

**MAGNOLIA.**—Five different leases for as many parts of the mine have been let.

**CAMARGO.**—*Manhattan Co.* are opening this mine, taking out the water, etc., preparatory to the commencement of work on the ledge.

**LONE STAR.**—The lessees are taking out about a ton of ore per day that will average very nearly \$1,000 a ton, and this has been going on for about a month.

There is a good donkey on the mine, plenty of ore in sight.

**OUTSIDE ORES.**—*Manhattan Co.* have lately worked for Plunkett and Brannan two lots of ore from Montezuma Dist. One lot of 5½ tons yielded at the rate of \$400 per ton, and the other \$377 per ton.

They have worked 4½ tons of ore from the same district for W. H. Carpenter, and returned \$305.50 per ton.

#### WASHOE.

**MONTHLY BULLION SHIPMENT.**—*Virginia Enterprise*, Oct. 8th: The shipment of hullion for Sept. was 526 bars, weighing 34,190 lbs and valued at \$190,054.16 to S. F. This light shipment is owing to the great scarcity of water, which has compelled many millmen to "hang up" altogether or to run but a small part of their machinery.

**CHOLLAR POTOMI.**—This mine yielded 490 tons of ore last week, assays averaging \$30 per ton.

**DANEY MINE.**—The Co. are engaged in running a drift for their lead at the 400 ft. level. The drift is in about 20 ft. They expect to cut the vein at a distance of 150 ft. At the same time that this drift is being driven in they are preparing to sink their main shaft an additional 100 ft. when a second shaft will be started for the lead and a level at the depth of 500 ft.

**WOODWORTH MILL.**—This is one of the finest mills in the State of its size. It will soon be capable of crushing about 70 tons of ore per day.

**A VAST DEPOSIT OF ORE.**—The great deposit of rich ore in the Crown Point and Belcher mines, as far as developed, is of the following dimensions: 533 ft. in length, from 50 to 70 ft. in width, and is known to be 300 ft. in depth; that is, beginning at the 900 ft. level, it has been explored as far as the 1,200 ft. level, where it appears to grow wider and stronger in every respect. The ore from the Belcher is singularly rich in gold—the bars running from 88 to 96 fine in gold, while those from the Yellow Jacket are but from 28 to 32 fins in gold.

**HALE AND NORCROSS.**—The work of re-timbering the engine shaft is now completed to within 681 ft. of the surface.

All the mills on Gold Cañon, except 2 or 3 that are out of repair, are now running to their utmost capacity.

**OPHIR MINE.**—The Co. have not been sinking in their new shaft since this day before yesterday, having ceased operations in the bottom of the shaft for the purpose of putting in a new and more powerful engine. They are also engaged in putting in a pump and tank on the 900 ft. level. The shaft is now down 1,080 ft.; when it has been sunk 20 ft. further—that is, when it shall have obtained 1,100 ft.—another pump and tank will be put in, and the same at the further depth of 200 ft.—that is, at the depth of 1,300 ft.—from which point they will start a drift for their lead.

**SERIOUS ACCIDENT.**—Yesterday afternoon, Thomas Cocking met with a serious accident at the Ophir mine. He was leaving the shaft at the 400 ft. station, when the cage suddenly started up, the sharp corner of the iron frame catching him in the right cheek and splitting it open for a distance of about 5 inches.

**A PAIR OF MULES LIVING AND WORKING 1,100 FT. UNDER GROUND.**—Night before last a second mule was lowered into the howels of the earth for use on the 1,100-ft. level of the Belcher mine. The one

aken down a few days since is still below, and is working satisfactorily.

**THE STURTEVANT** lode on the crown of the hill west from the Mammoth is the richest gold lode we have seen in the dist. and is a strong true vein. It assays at the rate of \$1,300 in gold, and about 25 oz. in silver per ton. The main shaft is 23 ft. and work progressing.

**THE ELEPHANT** is one of the mammoth veins of Cariboo Hill, with black sulphurets in a soft white gangue, with a 6 foot crevice easily mined.

**THE MONITOR** is well-cribbed to the depth of 64 feet.

**MINERAL POINT DIST.**—The Amanda bears a high reputation for rich ores; the last assay from a galeous specimen, runs at the rate of \$3,763 per ton.

**CENTRAL Herald**, Oct. 4th: J. Mellor, working the Lervitt mine at Mountain City, is having some fine looking ore crushed at Mellor & Borum's mill. Ten stamps are running on this quartz, 5 on surface ore from Russell, and 5 on different lots.

This week Kimbor & Co.'s Polar Star mill runs one battery on Cooper and one on Mazepa ore from Russell, one on California, 3 batteries on Prize and 1 on several different lots of ore.

The Black Hawk Co. keeps 85 stamps in motion on custom ores.

The N. Y. mill is running on Nevada ores. Sullivan & Wheeler's new 25 stamp mill is completed.

The Smith & Parmelee mill is running on Fiske and other ores.

Work is being prosecuted in the Bohtail tunnel.

The English Kansas M. Co. is energetically working the property purchased of J. F. Hardesty; 40 men are employed.

Ur Chicago creek, Mr. Groy on the Cypress has opened up a fine vein of mineral from 3 to 7 inches in width and worth \$500 per ton.

B. S. BUELL is steadily working the Illinois which supplies the 22 stamp mill above with sufficient ore to keep it running without intermission. Three cords are crushed daily. At 230 feet the distance between walls is 6 feet thick and the other one of 6 inches, with the space between filled with mill ore. The quartz raised is superior to that ever obtained from this vein.

SULLIVAN & WHEELER are running 40 stamps in the New York mill on Kansas ore.

LYON'S claim on the Kansas lode is yielding better ore than at any time during the month. Drifting and sloping is going ahead on 2 levels, at 100 and 250 ft. below surface. In the lower level there is 3 ft. of smelting and mill ore.

**ITEMS.**—Georgetown Union, Oct. 3d; Purtle & Co. are working the Alabama and are taking out 600 oz. ore....Phoenix lode, on Sherman Mt. has been leased.... Another mill run of two tons of Comet ore yielded at the rate of \$271.70 coin per ton....Crowley & Co. are working in the rich slide ground and have struck a rich lode. The mineral taken out, about one ton, is worth 1,082 ozs....A new discovery has been made on McClellan Mt. by H. C. Bates. The name is Overland, and the surface rock assays \$8,549 per ton....Fix & Co. are working the Munsel. The first-class ore taken out of this mine is worth by mill treatment, \$840 coin per ton.... Work is being actively carried on in the Silver Plume lode, with paying results.... Hill & Clemens have leased the Equator dump pile and the west half of the Equator mine. They are working over the dump pile by sluicing and are obtaining remunerative results. The ore saved is worth 841 ozs. per ton....Mining has been commenced on the east end of the Cashier lode, Sherman Mt. A drift is being run to tap the shaft already sunk....The Pelican lode is being actively worked by a large force. The ore continues as rich as ever....The Capt. Wells lode, on Sherman Mt. is being opened in several places. The ore is of good quality and is found in fair quantity in all parts of the lode....Webster & Ames are working the Cayuga lode and taking out mineral worth 380 ozs. They are also working the Soneca lode, the ore of which is worth, by mill treatment, 555 ozs.... The last mill run of Matilda Fletcher ore gave \$799 coin per ton in silver.

**Arizona.**

**SHRENBURG.**—Tucson Citizen, Sept. 23d: M. Ravena has made an arrangement with an English Co. to work his mine. Work will commence this fall. J. Frank & Co., of the Constancia mine, have a mill on the road.

**DISCOVERY.**—A discovery at Sarica, Sonora, Mex., is said to be gold in quartz, very rich.

**Colorado.**

**SHIPPED.**—Clear Creek Co., eor. Central Register, Oct. 4th: Palmer & Nichols shipped to-day a silver brick of 1,515½ ozs., 888 fine; \$1,739.95 coin value. On the 29th, another weighing 1,495.35 ozs., 777, fine \$1,502.23 coin value, and on the 15th, one weighing 1,419 80-1,000 ozs., 911 fine, coin value \$1,707.

**Stewart Reducing Co.** shipped, on the 28th, silver brick weighing 1,051 ozs., 804 fine, \$1,100 coin. And on the 15th, one weighing 1,170 ozs., 878 fine; coin value, \$1,328. The total shipments for the week ending Oct. 3d, amounted to \$4,027.49 coin.

**BOULDER Co.**—J. C. Miller and W. Snyder, have made a discovery on Cariboo Hill, and named it the Illinois. Tests of the best ore gave \$300 per ton.

The Cariboo mine is yielding better than ever before. They have 7 ft. of black sulphur ore, which will assay \$1,000 per ton.

Centt & Breed are pushing the work on the mill rapidly. They expect to run in about 3 weeks.

A few days ago a nugget of native silver, weighing 18 dwts., was taken from the "Western Slope," near the "Blue Bird."

The last assay of ore from the Idaho silver lode, Idaho Hill, gave \$850 in silver. Main shaft down 75 ft.

The main shaft of the Central is down 25 ft.

**MAMMOTH LODE**, near Cardinal, north from the Boulder Co., is vigorously worked by Dr. Hopkins. He has a complement of men in 3 shafts.

**Idaho.**

**ACROSS BASIN ITEMS.**—Idaho World, Sept. 28th: At Pioneer City B. Willson is still engaged in mining on Orleans Bar. The hank is from 20 to 25 feet deep, with gravel nearly at the top, and the bed-rock looks splendidly.

Stephenson & Co. have suspended operations on their claim above Pioneer City; the scarcity of water has caused a general cessation of mining in that section. Clarkson & Brown have shut down their quartz mill on account of the scarcity of water, but are still engaged in taking ore from the mine.

**DISCOVERY.**—A quartz lode was discovered at Granite Creek, on the 22d inst., by C. Clark; which promises rich. The ledge is 4½ ft. wide.

**Montana.**

**GERMAN GULCH.**—Deer Lodge Independent, Sept. 30th: Sluice robbing is a frequent occurrence. Estelle & Holland on the Cliff Extension are sinking a shaft and are down 29 ft. at which point the ledge is 8 ft. thick and the ore will average about \$100 per ton. Mr. Horton has a number of men working on the Alka ledge and is taking out first class ore in considerable quantities. Landers & Harps are successfully working ores by the Freiberg process. The old Stuart mill will soon be in operation.

**REDUCTION WORKS AT JEFFERSON.**—Helena Herald, Sept. 28th: A company has been organized in Chicago with a capital of \$75,000, and will at once commence the erection of Reduction and Smelting Works.

2,300 oz. of gold dust equal to \$46,000 in currency is the net result of a 6 weeks' run on W. Roe's claim at Pike's Peak, and is only about one-third of the gross amount which he has taken out during the season.

**Oregon.**

**MOSS AGATES.**—Portland Oregonian, Sept. 30th: Moss Agates have been discovered lately near the Warm Springs Indian Reservation in considerable quantities. A Mr. Dunbar writes: The strata are underlaid and covered by volcanic sandstone and tuffs containing the petrified bones of extinct tertiary animals. They are found one mile above here along the huffs of Chit like to two miles below. They are also found on the Te-mo-le-ons or Willow Creek, some 25 miles from here.

**Utah.**

**BULLION.**—S. L. Tribune, Oct. 5th: W. F. & Co. forwarded to N. Y. on the 1st, 15 bars of Pioche bullion, worth \$42,832.66, from the works of Raymond & Ely, and received from same place on the 4th, 8 bars, worth \$11,332.32.

**BATEMAN & BUEL AT WORK.**—These gentlemen have purchased the Tecoma mine in Lucine dist., for \$125,000 coin, and are rushing up a furnace on the site very fast. The Tecoma is a galena mine resembling the Flagstaff in Cottonwood, but thought to be a much more extensive body of mineral.

**Mining Stock Market.**

THURSDAY EVE., Oct. 12th, 1871.

Stocks last week were unusually active, but irregular, closing at a decline for most descriptions; over 700 tons of ore were taken from the Chollar-Potosi mine last week, assaying \$41.08 per ton. From the Belcher 2,000 tons were crushed in September, yielding \$161.103. The Reports from Crown Point and Raymond & Ely show improvement in supply and class of ore. receipts from the Meadow Valley mine for September were \$150,641. First shipment in October, \$10,400. Tuesday, stocks were low under increased demand for money, and the feverish condition of financial circles incident to the calamity in Chicago. The session of the Board yesterday was larger than usual, owing to the discussion of the great fire. The Board very generously donated, and forwarded to the Mayor of Chicago, \$8,000. Stocks came up again a little, owing to increase of confidence in financial circles. Stocks were generally firm this morning, with a fair degree of activity for these addicted to paying dividends.

THE VISALLA-DELTA has been recently enlarged, and is now one of the largest, best printed and most extensively circulated local weeklies in California. A new job press and material have lately been added to the office to meet the wants of a thrifty and growing community in one of the most promising agricultural districts of the State. E. M. Dewey, proprietor.

LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 294 Bowery, 157 E. 25th, 477 7th Ave., New York Good work at high prices if desired. 21v1-12mbp

**New Incorporations.**

The following have filed certificates with the County Clerk, San Francisco:

**KNOCKEDOCKER MINING Co.**—Capital Stock, \$2,400,000 in 24,000 shares. Trustees: B. T. Sherwood, J. E. De la Montague, E. Strother, J. Maguire and H. H. Flagg.

**GREENHORN GOLD M. Co.**—Capital Stock, \$1,200,000. Trustees: I. N. Gashwiler, Thos. Bell, Jos. Clark, J. T. Boyd and N. Thompson, Jr.

**PIOCHE WEST EXTENSION M. Co.**—Capital Stock, \$3,500,000 in 35,000 shares. Trustees: Thos. Bell, L. Maynard, J. H. Baird, A. J. Bowie, Jr., and M. J. McDonald.

**SPRING MOUNT M. Co.**—Capital Stock, \$3,500,000 in 35,000 shares. Trustees: L. Maynard, H. A. Lyons, Thos. Bell, I. N. Gashwiler and O. D. O'Sullivan.

**Leather Market Report.**

[Corrected weekly by Dolliver & Bro., No. 109 Post st.]

**SOLE LEATHER.**—Eastern shipments still keep the market firm and the demand good.

City Tanned Leather, \$10 00/100 00  
Santa Cruz Leather, \$10 00/100 00  
Country Leather, \$10 00/100 00

French stock comes in more freely, and prices are easier in leading skins. The cheaper grades still continue firm. Calf and calf skins are still scarce and high.

Success in business—Success in the business world usually depends upon being thoroughly prepared for its duties. Young men if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24 Post street, San Francisco. This is the only college on the Pacific Coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book-keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading cities of the United States and Canada. There are many interesting features about the school which cannot be discussed here. Call at the College and examine its workings. If unable, send for circular, and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address E. P. HEALD, President, Business College, San Francisco, Cal. 10v23bp-3m

**EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.**

**MARAVILLA COCOA.**—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but only doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this article, they have produced a Cocoa which they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma and a rare concentration of the purest elements of nutrition distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by St. Grocers, of whom also may be had Taylor Brothers' Original Homoeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. 1e25-ly

**N. Seibert's Eureka Lubricators for steam cylinders** are acknowledged by all engineers to be superior to all others they ever used. The oil is regulated by pressure of water into the steam pipe; the glass tube indicates the amount used; economy and regularity of feed is accomplished; no waste of oil on the outside of the engine; no trouble to the engineer; one pint of oil will last from three to nine days, according to speed and size of engine; packing on stems and rods lasts longer; rings do not rust or gum, and will pay for themselves in a short time, in the saving of oil, over the old style; are warranted to give satisfaction. Patented February 14, 1871. Manufactured by the California Brass Works, 125 First street, San Francisco. 8v23-3a

**UNIVERSITY OF CALIFORNIA.**—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-keeping are taught.

Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TAIT, Oakland, Master Fifth Class. 8e3b7f

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-stand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address Hudson River Wire Works, 75 William street, N. Y., or 1 Dearborn street, Chicago, Ill. 23v1-12mbp

**CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.**

READERS will favor advertisers by mentioning the information gained from notices in our paper.

## NOTICES OF RECENT PATENTS.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

**BEDSTEAD.**—E. T. Barlow, San Francisco. This invention relates to an improved device for fastening the side rails of a bedstead to the head and foot posts, and for other similar fastenings, and it consists of two plates, each of which has one end formed into a hook. One of these plates is fastened to the upper edge of the rail, and extends beyond so that its hooked end shall enter an upward curving recess in the post. The other plate hooks into a similar recess in the post at the bottom of the rail, and is forced upward against the bottom of the rail and then secured, thus binding the rail firmly between the two plates.

**NOZZLE FOR OIL-CANS.**—Sharron P. Doane, San Francisco, Cal. This improvement consists, first, in the employment of a wire gauze partition through which the oil must pass before reaching the nozzle, in order to intercept any dirt or other particles which would otherwise lodge in the small end of the nozzle and choke up the passage. It has, secondly, for its object, the employment of a sliding punch which moves along the nozzle and forces out any dirt which may have accumulated by accident or otherwise in the small end. This invention is especially useful, as the nozzle often becomes clogged by dropping the can, and is frequently broken off to save the trouble of cleaning.

**WASHING MACHINE.**—Henry Elford Lea, Half-Moon Bay, Cal. This invention relates to an improvement in washing machines, and it consists of a containing box for the clothes, and within which in a revolving slat or perforated drum or cylinder the clothes are placed. A combined water boiler and furnace of peculiar construction stand at a short distance from the box and pipes which communicate between it and the boiler so as to keep up a continual circulation of hot water and steam between the two, and this in connection with an occasional revolution of the slat or perforated drum or cylinder, accomplishes the washing in a short time.

**IMPROVEMENTS IN THE MANUFACTURE OF DENTAL PLATES.**—Francis M. Shields, Sacramento. The object of this invention is to provide an improved process and apparatus to be employed in the manufacture of artificial dental plates from the metal aluminum. The process consists, first, in casting the plate at two operations, so that while the teeth are securely fastened to it, they are in no danger of being broken or displaced by the contraction of the plate in cooling. The apparatus consists of a flask suspended on trunnions so as to swing between standards. The flask is of proper shape and its exterior conforms to the shape of the model so as to avoid fracture. A curved pipe rises from the top of the flask and carries a crucible at its outer end, within which a sufficient quantity of the metal is fused for a plate. An air pipe enters one side of the curved tube and through this a pressure is brought upon the metal sufficient to cause it to thoroughly fill the matrix. Small upright tubes arise from the cover of the flask and by means of minute holes in these it is possible to know when the mold is full. The process and devices are exceedingly interesting and valuable.

**ANIMAL TRAP.**—John H. Mooney, Geo. A. Lloyd, S. F., Cal. The object of this invention is to provide an improved trap, chiefly useful for gophers, squirrels, etc., and it consists mainly in the employment of two rods moving parallel through a suitable supporting frame. These rods are connected together at their rear ends and their front ends are armed with sharp points. A spring is so arranged as to throw the rods forward if the holding catch is disturbed, after being set, and by a peculiar arrangement of mechanism the upper one of the rods is made to describe an arc with its forward end as it shoots out, thus reaching over and grasping the animal which has approached the trap. This device is

very simple and effectual, especially for gophers, which it always seizes, notwithstanding the load of dirt which they always push before them and which generally springs other traps without catching them.

**IMPROVEMENT IN HORSE POWERS.**—R. J. Cheney, Petaluma, Cal. The object of this invention is to provide an improvement in horse powers, by means of which, a brake can be readily applied, and it consists of the usual frame supporting the horse power with a central hub, about which the master wheel turns. A nut is affixed to a portion of the frame, and a rod is arranged to screw down through this nut. A plate is fixed to the lower end of this rod and bears upon the tumbling rod when screwed down and thus regulates the speed of the machine.

## INDIFFERENT METALLURGY.

[From the Overland Monthly.]

No other region has a better right to be proud of its extensive and apparently inexhaustive auriferous and argentiferous deposits than the Pacific Coast. It is to them that it is really indebted for the rapidity with which it has advanced to the leading position it now holds as a mining region. Such deposits are undoubtedly the very best agents for populating a new and uninhabited country, and are justly entitled to the honor of being considered the loadstone of civilization. It is, however, noteworthy, that all countries, so peopled, have, without a single exception, retained their inhabitants through the medium of some other resource, at first despised and neglected, upon which they have also been dependent for permanent prosperity. And, much as the present prosperous condition of the Pacific Slope is due to the products of its gold and silver mines, other resources, of at present supposed inferiority, are evidently destined to permanently establish and maintain the same in the future. Of course, it cannot be considered that our gold and silver ledges exhibit any signs of early exhaustion; but the fact that their products do not enter generally into the common industries of the country, justifies the belief that they will not always occupy the most prominent position among our mineral resources. The amount of labor engaged in the extraction and reduction of these metals is limited; and, inasmuch as they are not applied to the useful arts, the labor, directly or indirectly dependent upon them, cannot possibly greatly exceed that already engaged in those two branches.

In the early period of our mining history, the frenzy accompanying the "gold fever" caused those who flocked to our shores to overlook other resources of wealth, of which the land was equally prolific. The varied character of our climate, and the rich soils of our extensive valleys and foot-hills, were actually condemned, as being utterly unadapted for the profitable production of cereals. Experience has, long ago, dispelled that erroneous idea, proving the land to be as fruitful and as varied in its agricultural products as that of any other country; in fact, the aggregate annual value of our agricultural products greatly exceeds the aggregate annual value of the products of our gold and silver mines.

Our agricultural resources are, consequently, at present, more valuable than all others. It is, nevertheless, very probable that the leading position will, ultimately, be usurped by our untouched deposits of inferior metals. And to one of these inferior metals we are already greatly indebted for our reputation as a gold-mining country. Our rich auriferous deposits would have been of much less actual value to us, had it not been for the opportune discovery of extensive deposits of quicksilver in our Coast Range. The limited quantity of that metal which the mines of other countries could have actually afforded to contribute, would have been altogether insufficient to meet the sudden and enormous demand created for it here. Providentially, an abundance of this indispensable agent for the extraction of gold from the rocks throughout which it is disseminated, in almost imperceptible particles, existed in our mountain ranges. We are thus spared the anxiety that would naturally possess us had it not existed, as this fine gold would be utterly and irrevocably lost without its assistance.

The great bulk, and general dissemination, of the deposits of inferior metals, throughout the Pacific Coast, will eventually give them a decided superiority over all our other resources—mineral and agricultural—both as to the quantity of labor

employed in working the mines and in reducing the ores, and to the aggregate value of the results. These inferior metals will, ultimately, establish the character of this coast, as being pre-eminently a mining region. Lead and copper will evidently be the principal products, ere long, as they exist in much greater abundance than any other. The geological formation, in many parts of the coast, favors the presumption of the existence of extensive deposits of iron ore; but none of any importance have, as yet, been discovered. Large bodies of chromic iron exist in various localities; but it loses much of its value to us, on account of there being no demand here for chromates, for the manufacture of which, only, it is used. Whether it is of any commercial value for export, has not yet been fully demonstrated. A few small shipments have been made lately, for experiment. The only deposits of iron ore, of any prospective value, are those existing on the Willamette River, in Oregon, and in some of the interior counties in this State. Had our iron-ore deposits been extensive, it is very doubtful whether they could be utilized, on account of the scarcity of fuel suitable for smelting purposes. The carboniferous beds, lying south of the forty-ninth parallel of latitude, are of the lignite formation, and no method of smelting with lignite coal has yet been discovered. The blast-furnaces of the present day are adapted for the consumption of bituminous and anthracite coal, only. The iron-ore deposits in this State are situated so far in the interior, that, even with an abundance of proper fuel, it is not likely they will become of value to any other than the adjacent mining districts, as pig-iron can be imported to the coast, from Europe and the Eastern States, for as low, if not lower, rates than it could possibly be shipped from the interior by rail.

Our veins of lead ore, on the contrary, are extensive in all the States and Territories on the Pacific Slope. Nevada is itself a vast basin of metalliferous deposits, as proven by the developments already made, and the large quantities of argentiferous lead transmitted to this market from the White Pine, Eureka, Elko, Battle Mountain, and Palisade Districts. The Eureka District, especially, appears to be a solid mass of lead ore, rich in gold and silver.

The deposits of copper ore are nearly as extensive as those of lead; and, although at present neglected, will undoubtedly attract, at an early period, as much attention as they have once done in the past.

Discoveries of the presence of extensive bodies of tin ore have been recently made in the southern counties of the State, which promise to be an important addition to our future mineral wealth.

It may be confidently asserted that the future condition of our metallurgy is entirely dependent upon the manner in which we utilize our various deposits. If, instead of converting them into manufactured material and applying them to the building up of our home industries, we ship them in their crude state, to swell the industries and increase the wealth of foreign lands, then we shall be wilfully divesting ourselves of that which it is our duty, and to our immediate and future benefit, to retain. The only reduction works extant, to the west of the Rocky Mountains, are the Selby Smelting Works, situated at Black Point. These works are adapted only for the treatment of argentiferous lead, either as dressed ore or as crude bars.

Another smelting establishment is now being erected at the south end of the city, by Mr. Edmund C. Burr, which, when completed, will be an additional attraction for the shipment of ores in this direction.

Much of the Utah and Nevada argentiferous ore and bars of crude metal, formerly treated at the Selby Works, is, at present, shipped to New York and England, the greater portion going to the latter country. The quantity of ore and bars thus exported to England has been sufficiently great to induce the Hon. Henry Hussey Vivian, M. P.—the prince of smelters—to reopen the White Rock Smelting Works, located at Swansea, South Wales, and which have been closed for many years. Extensive alterations have been made in this establishment, so as to adapt it for the special treatment of the galena of the Pacific Coast.

We have no provision whatever for turning into profitable account the immense bodies of antimony throughout California and Nevada. That no effort should be made to utilize this important mineral is somewhat strange when we consider that the whole of Europe is now almost entirely dependent upon the Island of Borneo for its supply. Neither have we any pro-

vision for the treatment of copper ores, that mining industry being at a complete standstill on that account; nor for the treatment of silver ores, or argentiferous copper ores; nor for the treatment of argentiferous and auriferous copper ores.

Those ores that are extracted from our mines, and for which we have no provision made for their efficient treatment, are shipped abroad, and the country is deprived of that increase in its industries which is its legitimate property. And, while we are indifferent observers of all this, Chicago, Omaha, and other cities, located on the Eastern slope, are setting up their individual claims to the vast mineral wealth of the West. They are beginning to inquire why they shall not reap some benefit themselves from the mineral deposits existing midway between them and the chief mart on this side, and they are rapidly qualifying themselves to enter earnestly into competition for them.

[To be continued.]

## Pacific Steam Washing Machine.

This is something that will interest our lady readers, who, if they do not have the work to do themselves, should nevertheless welcome anything that will assist their servants in doing it. This machine is a valuable invention which consists of a box, inside of which is a revolving slat or perforated drum or cylinder, into which the clothes or other fabrics to be washed are placed.

A combined water boiler and furnace of peculiar construction, stands at a short distance from the box, and pipes communicate between it and the boiler, so as to

keep up a constant circulation of hot water and steam between the two, which, in connection with an occasional revolution of the slat, or perforated drum, accomplishes the washing in a short time. The clothes are put into this drum through the proper opening, and the water poured in until it rises up in the box so as to cover the lower part of the drum; this fills the boiler, which keeps the water, after once heating it, at the boiling temperature by a very slight increment of heat. The hot water is continually passing and repassing through the clothes while the drum is being turned by means of the crank, and they are washed without the necessity of rubbing. This is accomplished by slight friction given during the revolution of the drum and the hot water and steam combined.

This is a late California invention, and its merits can be easily seen by reference to our engraving. It can be set up in a shed, or anywhere, independent of a stove. This machine will cause a great saving in clothes, especially fine fabrics, like laces, etc.; and is warranted to wash without rubbing, if instructions are followed. Two different sizes are made—one for landladies and one for family use. At present they are only made to order, for those making are all engaged. Parties desiring to purchase will be referred to various persons using the machines who have thoroughly tested them.

This invention was patented through our agency by H. E. Lea. Any further information concerning it may be had by addressing the patentee at Half-Moon Bay, San Mateo County, Cal.

## USEFUL INFORMATION.

**VEGETABLE LEATHER** is now extensively manufactured, the principal materials being caoutchouc and naphtha. The product is only one-third as costly as ordinary leather, which it resembles so nearly that they can be distinguished only by close inspection; and the vegetable leather has the additional advantage of being made in entire pieces fifty yards in length if desired, one and a half yards wide, of any thickness demanded, of uniform quality and ample strength. It has but little odor, that of the naphtha being subdued in the process of manufacture. It is proof against the effects of moisture, and a nail will not scratch the surface. For book-binding, covering for writing desks and tables etc., it is especially adapted and largely used.

**LEATHER BOARDS.**—Within a few years past, refuse leather, in the form of cuttings, scrapings, etc., from shoe and harness factories, has been utilized by being converted into leather boards, which are extensively employed at the present time in the United States and Europe for the manufacture of inner soles of shoes, and for other purposes, where the material is not likely to be exposed to the wet. The process of preparing these boards consists in first cleaning the scraps, so as to free them from all foreign substances, and then softening them for a time in water, to which is added some adhesive substance such as gelatine. After being sufficiently softened the scraps are laid upon tin plates of the proper size, having a rim all around, and arranged longitudinally and transversely, so as to make the strata nearly even, until the required thickness is obtained. A number of these plates are then placed one upon another and subjected to a hydraulic pressure, until the separate fragments are united into a nearly uniform mass. After these layers have dried sufficiently, they are passed under a roller, so as to smooth them off and give to them the external appearance of the original leather.

**THE MANUFACTURE OF KNIVES.**—Few people have any idea through what a number of hands their pocket-knives have passed in the process of manufacture. A bar of steel destined to furnish a number of blades, is heated to redness. A length is cut off, and the forger speedily "moods" this—that is, shapes it roughly into the form of a pocket-knife blade. Another heating is then required to fit the end for being fashioned into the tang and yet another before it can undergo the further operation of "smithing," the last stage of which is the stamping of the mark of the thumb nail to facilitate opening. The tang is then ground and the blade marked with the name of the firm. The slight bulge on the reverse side caused by this operation is removed by fire or the grindstone. The blade is then hardened by heating it to redness and then plunging it into water up to the tang. The tempering process follows next, the bluish yellow tint being considered as indicating that the proper degree of heat at which to immerse the blade once more in cold water has been attained. After this the various kinds of blades are classified in the warehouse and undergo sundry grinding operations to fit them for being hafted. Twelve distinct processes have by this time been gone through, and many more are necessary before the knife is completely finished, although the number of hands which it has now to pass through depends in a great measure on the finish to be given to the handle, according to the quality of the blade with which it is fitted, and the price which the completed article is intended to realize.—*Engineering and Mining Journal.*

**PEARL MANUFACTORY.**—The Chinese have, for centuries, carried on a well organized system of manufacturing pearls. The invention was made early in the 13th century, and they still honor the inventor with a temple, and acts of ceremonial worship. The French pearls, which excel all others in the beauty of their imitation, are manufactured, in the first instance, out of the scales of tiny white fish, which abound in the small tributaries of the Seine and Marne. It takes from seventeen to eighteen thousand fish to make one pound of the famous *essence d'orient*. It is curious that the nearest cognate substance to the pearl is bezoar, a concretion of deep olive green color, found in the stomachs of goats, dogs, cows, and especially of camels. The bezoar used to be a valued talisman.

Five persons to each house is the average number developed by the British census.

To a poor man, poverty greater than his own never appeals in vain.

## About India Rubber Shoes.

The first pair of India rubber shoes ever seen in the United States was brought here in 1820. They were gilt, and were pointed like the slippers of a Chinese mandarin. This pair, which were handed about as a curiosity, were followed, in 1823, by an importation of five hundred pairs, which, rough and ill-shaped as they were, were eagerly bought at high prices; and from that time onward, there was a regular importation of India rubber shoes from South America, of five thousand pairs per annum. It was the high prices which these shoes commanded, as compared with the extreme cheapness of the raw material, that caused an India rubber mania in the Eastern States. A company started at Roxbury, Mass., with a capital of three hundred thousand dollars, with extravagant expectations of its stockholders. The company met with unexpected difficulties. Shoes made in winter melted as soon as the summer came. When exposed to the cold, they grew as hard as stone. And what was worse, no one could tell of the winter made shoes whether they would stand the summer heats or not. The company feared to manufacture a large quantity, since the first hot week in June would melt the product of eight months' labor as readily as a single pair of shoes. The want of a way of curing or hardening this singular substance obliged the Roxbury company to wind up its affairs, which ruined a large number of the people of Massachusetts.

**WATER WORKS OF ROME.**—In old Rome there were nine aqueducts to supply the city with water, and the amount furnished for each inhabitant could hardly be less than three hundred gallons daily, or more than six times as much as is supplied to each person in London at the present time. One of their aqueducts was fifty-four miles long, and one forty-two miles long. No modern city ever had such perfect arrangements for baths and perfect cleanliness as Rome. The Roman sewers for carrying off the filth of the city were also more perfect. The main one, *cloaca maxima*, had a series of small channels flowing into it from all parts of the city, rendering the drainage most complete.

**SWANS SINGING.**—The singing of swans has been supposed to be a fiction; but John A. Hjaltalin, an Icelander, writes that he has often heard them sing in one of the firths of Western Iceland, where hundreds of them congregate. In the morning and evening their song is so loud that it can be heard miles away, and the mountains on both sides ring with the echo of it; for each individual seems to join in the chorus. The singing has not the slightest resemblance to the cackling of geese or the quacking of ducks. It is clear and full, and has a metallic ring. The notion that the singing is sweetest just before the swan's death is prevalent in Iceland. Their nests are in small inland lakes or tarns, only one pair nesting at a single lake.

**TO ELECTROTYPE ON CLOTH.**—For the purpose of coating fabrics and tissues with metal, such as copper, silver, and gold, the material is first to be impregnated with a solution of sulphate of copper, in ammonia, and then dried. After drying, the whole is immersed in a warm solution of grape sugar, which develops oxide of copper, upon which silver or gold can be electroplated in the usual way.

**AMERICAN WONDERS.**—The largest city park in the world is in Philadelphia. It contains over 2,000 acres.

The greatest grain port in the world is Chicago.

The longest railroad in the world is the Pacific.

The greatest mass of iron in the world is the Iron Mountain, of Missouri.

The largest aqueduct in the world is the Croton Aqueduct, New York.

**TO KNOW A REAL DIAMOND.**—The real diamond, though brilliant, is not transparent. When a diamond is polished, before it is set, its genuineness may be ascertained by laying it on a newspaper. If the stone hides the letters, it is real; if they shine through and are visible, the diamond is paste, rock crystal, or other imitation.

The number of horses in Russia is greater in proportion to the population than it is in our greatest horse region—Kentucky. Russia has one horse to every three persons. Kentucky has one horse to about four and a half of its population.

**TACKS.**—In the United States there are two hundred and fifty different kinds of tacks manufactured from brass, copper, zinc, and steel.

## GOOD HEALTH.

## DIGESTIVE PROPERTIES OF FRUITS.

With the exception of strawberries, there is no dessert fruit, produced in a wild state, easy of digestion. The crab-apple and sloe, the parents of the cultivated apple and plum, are wholly unfit for use, except in the shape of jams, or preserves, with a plentiful addition of sugar to correct the astringent nature.

## Commencing With the Apple—

the fruit in most general use, of which we have many varieties—the best being suitable for different purposes, but all containing more or less of saccharine matter, acid, mucilage, soft woody fibre, and water, the quality of the fruit being dependent upon the proportion in which one or the other of these prevails. The aroma of apples, on which their flavor seems to depend, is supposed to act as a mild stimulant, and to assist digestion: therefore those apples which have the finest flavor are the most esteemed. The mellow sorts abound in this quality, and they also contain a greater than ordinary proportion of sugar and mucilage, consequently are more nutritious. Pippins and all hard varieties possess much woody fibre, difficult of digestion. The dry mealy kinds, although not much relished, are highly nutritive, while the watery sorts are generally crude, cold, and ill adapted to weak stomachs in their raw state.

But apples of very inferior quality are made palatable and wholesome by the application of heat, and the fruit of apple pie if not too much spiced, or even the roasted apple, is highly nutritive and digestible. Before this fruit is subjected to heat, it is composed of a great number of little cells and vessels, containing the acid juice and the pulp—probably in a separate state. When heated, the juice expands and hursts through the cells, as the temperature increases, the watery portion of the moisture is partly converted into steam, and evaporates through the rind.

When the acid and pulp of the apple are thus set free from their confinement, they enter into more intimate union, and the taste of the acid is mellowed by its mixture with the pulp, in the same manner as rum is mellowed by being mixed with milk: as the pulp also contains saccharine, this is disengaged by the heat, and mixes with the acid.

Ripe, sweet, and mealy apples, produce a laxative effect on the bowels, while those which are sour and astringent should be avoided by the sedentary, as they are apt to induce costiveness, griping, and flatulency, particularly when eaten after meals by persons indulging in wine and spirits.

## Pears

have but little of the acid usually found in apples, but they generally possess more saccharine, and also more woody fibre which renders some kinds indigestible. Those which are not hard and solid contain along with their sugar, a considerable proportion of mucilage, which—although nourishing—is apt to ferment in the stomach and produce flatulence. The *Maria Louisa* and *Old Burgundy* are of easy digestion, the former perhaps the best and handsomest pear produced, and these when ripe may be eaten freely being sweet, mellow, and laxative, and very salutary to some constitutions, but heavy to cold stomachs when taken in excess. The very hard sorts should be prohibited to the weak, and moderately indulged in by the robust, having little nutriment, and their great quantity of woody fibre serving to overload and fatigue the stomach.

## Strawberries.

The strawberry was esteemed by the late Dr. Abernethy as the most wholesome of all fruit, "halsamic and refreshing, and one of the most precious gifts of Providence." It is mildly acid, contains a medium proportion of sugar and mucilage, and the seeds act on the bowels similarly to those of the fig. In some cases the seeds are said to have accumulated in the stomach and produced an alarming disease. The occurrence is rare, however, and need no more deter us from eating strawberries than the fact of a person being choked with fish-bone should deter us from eating fish. According to Linnæus, strawberries are an excellent prevention of gout and gravel. Wine is supposed to be injurious to the beneficial action of strawberries when taken in connection, and the usual appendage of cream and sugar, although highly nourishing to the robust is not adapted to weak stomachs. The fruit should not be too freely indulged in after dinner, or any other full meal. In warm weather strawberries

are very grateful for breakfast or linner, and a foreign fashion has lately been adopted: it is as follows:—Take off the stalks from as many berries as will form one layer at the bottom of a dish; sift some fine loaf-sugar over them, then place another layer, and sift again, each layer being smaller than the other, and the heap raised in a pyramidal form. When you have several layers squeeze the juice of a fresh lemon over the whole. Before they are served out, they should be gently disturbed so as to receive the full benefit of the lemon juice and sugar. They may be eaten heartily when thus prepared, without danger.

## Raspberries

resemble strawberries in most of their qualities, and may be used in the same manner; but their flavor is so strong to be agreeable when eaten fresh; they are, therefore, mostly used for tarts or preserving. In pickling, great care must be taken to abstract the small worm which will generally be found on withdrawing the stock when quite ripe.

## Gooseberries

according to Dr. John, an eminent continental chemist, the analysis of this fruit gave the following substances, but in what proportion he does not state: Water, sugar, citrate of lime, ditto of potash, resin gum, fibrin, ammonia, phosphate of lime and phosphate of magnesia. Next to the strawberry the gooseberry is esteemed as the most wholesome and digestible of our native fruits. Like that, it possesses a good mixture of sugar and acid, but abounds more in mucilage and hard seeds. The skin besides is astringent, acid, fibry and indigestible; from the latter of which qualities it acts upon the bowels by irritation, and proves laxative; for which reason some have recommended the skins to be eaten. Of this we do not approve, for the seeds answer the purpose sufficiently well without loading the bowels with a mass of indigestible and irritable substances. Gooseberries are recommended in cutaneous disease—being cooling to the blood—and also in deficiency of bile. Heat, whether applied to the stewing or baking proves (as in the case of apples) an excellent corrector of the crude juices of unripe and inferior fruit, and green shoots of rhubarb, which are likewise sub-acid and saccharine, make a wholesome addition to pies and puddings in the early part of summer.

**RAIN WATER** is very impure and unfit to drink until it is filtered, either through the soil, or by artificial means. Rain-water, especially that falling upon cities brings down with it much dirt which has been floating in the atmosphere—such as soot, earth and vegetable dust, ammoniacal salts, acids of various kinds, etc. In the country, rain-water is less impure. In this State the water of the early rains is much more impure than that from the later. The matter thus brought down exerts an important fertilizing action upon the soil.

Water, if very bad, can readily be examined in reference to its purity by carefully inspecting it with eye. If it is not perfectly clear it is impure. Much can also be determined by the taste. No water is good that tastes or smells badly. The microscope and analysis are, however, the only perfectly reliable means of testing it. No water is absolutely pure unless it is made so by careful distillation.

**THE TAPEWORM.**—It is very seldom that persons are affected with a tapeworm who eat their meat well cooked. The cyst that develops parasites is killed by thorough cooking. The tapeworm is usually developed from a cyst found in mealy pork. When this cyst passes uninjured into the human stomach it soon develops into a worm. As the joints mature, they are cast off. If these joints, when living, find their way into the stomach of a hog they then lay their eggs, which are developed into cysts, which work their way into the flesh of the animal, where they remain without any further progress toward development until they find their second home in the human stomach, and again take the round. It is thus that this troublesome parasite is kept up. They have also, though recently, been known to develop in the bovine species.

## Notices to Correspondents.

EDS. PRESS:—Will you inform me in your  
next what is the cheapest effectual de-  
odorizer and disinfectant for cesspools  
and privies. A SUBSCRIBER.

Carbolic acid is considered the best article  
for the purpose indicated. Its disin-  
fectant, or rather antiseptic properties,  
are very remarkable. Recognized some  
twenty years ago, and used with marked  
success during the prevalence of cholera  
by the Frenchman, Dr. Jules Lemaire,  
it is only lately that the preventive and  
curative properties of this powerful  
agent have been evidenced. It is used  
for any purpose where it is an object to  
prevent decay and decomposition. Car-  
bolate of Lime possesses all the disinfect-  
ant properties of carbolic acid and is  
withal in a cheap form, to be used for the  
purposes indicated. It is put up in  
pound packages in the shape of a pow-  
der, and sells in this city at 25 cents per  
package. It possesses the power of de-  
stroying the germ or septic principle of  
all disagreeable and contagious emanations.

EDS. PRESS:—Will you be kind enough to  
inform one of your readers in Montana  
what a single sash saw will cut in 12  
hours (by water or steam power), and  
what is the most cut of lumber per day.  
I am told that 5,000 feet can be cut in 12  
hours by a sash saw, and by a circular,  
10,000 feet. Is this so?

The contingencies connected with these  
questions render them difficult to answer.  
The amount of power applied; size of  
saw; quality of lumber; and efficiency of  
of the sawyer, would all make some dif-  
ference. A common sash saw will, how-  
ever, with care, cut 5,000 feet in 12  
hours. As to the circular, a lumber  
dealer in this city informs us that he  
has a double circular saw that cuts 30,-  
000 feet a day, without doing the "edg-  
ing." The capacity would depend en-  
tirely on the above mentioned conditions.

## CHEMISTRY OF THE WASHOE PROCESS.

The process of pan amalgamation, often  
called the Washoe Process from having been  
used first in the Washoe district, has ever  
presented and still presents, many difficult  
problems both to the theorist and to the  
practical millman. To promote amalga-  
mation, besides numerous mechanical con-  
structions, various materials have been  
added to the regular charge of ore and  
quicksilver, some palpably absurd, many  
of questionable utility, and of those whose  
use is generally acknowledged as more or  
less advantageous, we yet know almost  
nothing of the exact influence exerted.

The only chemicals now used to any  
general extent are sulphate of copper and  
salt. While the efficiency of these in  
many cases, as in the treatment of tailings,  
cannot be doubted, yet in very many other  
cases their utility is questionable; certainly  
at least in the manner and quantity in  
which they are employed. Concerning  
them one can hardly get the same opinion  
at two different mills. Some establish-  
ments have used both, others only one,  
and neither of the two with indifferent re-  
sults. We know of cases where so small  
quantities have been employed that no ap-  
preciable result could possibly occur, and  
hence experiments in dropping one or  
both afford no grounds for any deductions  
as to their action. Other cases cannot be  
thru left out of consideration.

In the volume on Mining Industry, by  
the U. S. Geological Exploration of the  
40th Parallel, Mr. Arnold Hague contri-  
butes a most interesting chapter on the  
Chemistry of the Washoe Process, and we  
now propose condensing from this most  
important subject to many of our readers.

### I.—Character of the Ore.

The ore of the Comstock lode consists of  
quartz, as gangue, blende, galena, sulphide  
of silver (argentite) silver, gold, iron py-  
rites, copper pyrites, and of rarer occur-  
ence, stephanite (sulphur, antimony and  
silver), and polybasite (sulphur, antimony  
and silver generally with copper and arse-  
nic). A few other minerals have also been  
found. The clay gives considerable trou-  
ble and loss by its mechanical action.

In order to accurately determine the  
composition of the ore, a number of sam-  
ples of first-class (from the Savage) and  
third-class rock (from the Kentucky) were  
carefully analyzed. The first assayed  
\$49.22, the other \$43.74. No arsenic or  
antimony was found in either case (absence  
of stephanite and polybasite), nor was any  
native silver detected. The only ingredi-  
ents which could influence the chemical  
conditions during an amalgamation were:

1st Class Ore.	3d Class Ore.
Protoxide of iron.....1.96 per cent.	0.82 per cent.
Bisulphide of iron.....1.80 "	0.39 "
Subsulphide of copper......30 "	.41 "
Sulphide of zinc.....1.75 "	.13 "
Sulphide of lead......36 "	.02 "
Sulphide of silver.....1.08 "	.12 "
Gold......02 "	.0017 "
7.26	2.4917

### II.—Action of Mercury on the Mineral.

To ascertain as far as possible, the ac-  
tion of the minerals of mercury and of the  
chemical agents employed in, or formed  
during, pan amalgamation, the following  
experiments were made.

MERCURY ALONE, *a*, rubbed with native  
silver amalgamates easily; *b*, with chloride  
of silver forms amalgam and chloride of  
mercury; *c*, with argentite gives an imper-  
fect amalgamation; *d*, with stephanite and  
polybasite gives imperfect amalgamation,  
but better than with argentite, owing  
probably to the finer sub-division of the  
minerals.

MERCURY HOLDING A LITTLE COPPER AMAL-  
GAM, *a* and *b*, same as above; *c* and *d*, more  
perfect and satisfactory decomposition.

MERCURY AND FINE METALLIC IRON, with  
constant application of heat, acted on  
chloride of silver, argentite and stephanite  
with greater energy than mercury alone.

CHLORIDE OF COPPER, *a*, with pulverized  
argentite, standing 10 days in the cold,  
with occasional application of heat, gave a  
little chloride of silver and a trace of sul-  
phuric acid; heated (a moderately concen-  
trated solution) with the same to 90° C. for  
24 hours, gave sulphuric acid and sub-  
chloride of copper and chloridized but  
little over one-half of the silver; *b*, with  
polybasite, in the cold, gave a little chlori-  
dized silver.

SUB-CHLORIDE OF COPPER, with argentite,  
treated like the chloride; in the cold, de-  
composition ensued after several days;  
heated, only 2.9 per cent. of the silver was  
chloridized, while with the chloride of  
copper, 58 per cent. was chloridized.

SALT AND SULPHATE OF COPPER, a strong  
solution, *a*, with pulverized galena, stand-  
ing three weeks in the cold, gave unde-  
composed mineral encrusted with a large  
amount of sulphate of lead and oxychloride  
of copper; *b*, with blende, same treatment,  
gave considerable oxide of zinc, little cop-  
per and blende coated with oxychloride of  
copper.

COPPER SOLUTIONS alter but slightly  
iron and copper pyrites.

### III.—Pan Experiments.

With a view to determine, if possible,  
some of the problems involved in the action  
of mercury, salt and sulphate of copper  
employed in the decomposition of Com-  
stock ore by the Washoe process, a series  
of pan experiments were made on the two  
classes of ores given above. These experi-  
ments were made to imitate as far as pos-  
sible actual mill operations. A small Wheel-  
er pan was used, from which the pulp ran  
into a settler, where additional mercury  
was used, and finally the great bulk of  
sand and mercury was caught in huckete  
and separated by hand, to avoid all loss.

Of the second-class ore, charges of 20 and  
of 15 lbs. were used, with 4 and 6 lbs. of  
mercury, and, in different cases, from ¼ oz.  
to 4 oz. salt with one-half the amount of  
sulphate of copper in each instance. In  
six experiments no chemicals (except mer-  
cury) were employed. In four cases sub-  
chloride of copper was added in a solution  
of salt, the quantity of copper being equiv-  
alent to the amount contained in 1 oz. of  
the sulphate of copper. In one case 1½  
oz. salt with 2 oz. sulphate of copper, and  
½ oz. sulphate of iron were added. The  
pan was run sometimes four and some-  
times five hours. Of the first-class ore  
charges of 10 to 15 lbs. with three to four  
lbs. mercury were used, of salt, 1 to 4 oz.,  
with one-half the amount of sulphate of  
copper, and sometimes neither, were em-  
ployed. In four cases sub-chloride of  
copper as above, and in two cases, 1½ oz.  
salt with sulphate of iron and copper,  
were added. Time 4, 5, and 6 hours.

The results were by no means satisfac-  
tory in all respects, yet they throw some  
light on several important points. The  
relative yield of gold and silver was much  
higher in the case of the lower grade than  
of the higher grade ore. With the former,  
in every trial, except one, the yield was  
larger than usually returned under the  
most favorable circumstances in practice,  
due probably, in a great measure to the  
relatively large amount of mercury em-  
ployed. The third-class ore, moreover,  
gave as favorable results with mercury  
alone as when chemical agents were added,  
proving the utility of quicksilver aided by  
heat and iron to decompose the power and  
easily reducible silver minerals.

With the high grade ore the yield was  
in all cases very much below the yield with  
the low grade, and also lower than the  
average returns from mill upon ores which  
are not first roasted, this is due to the  
large percentage of blende and galena pres-  
ent. The use of chemicals showed a decided  
gain in yield where much base metal oc-  
curs. The use of salt and sulphate of  
copper did not increase the loss of mer-  
cury, although large quantities were pres-

ent in many cases. In the experiments,  
conducted with every possible precaution  
to repeat the precise conditions of a charge,  
using the same quantities of salt, sulphate  
of copper and mercury, the results differ  
as widely as in those cases where the  
amount of chemical agents are much less  
or entirely abandoned. The cause of these  
great differences in the yield of hullion  
must be sought elsewhere than in the vary-  
ing amounts of the chemical agents  
used, however important they may be, in  
certain cases, in aiding and assisting de-  
composition. A favorable yield undoubt-  
edly depends more upon the native condi-  
tion of the mercury than anything that is  
usually added to the pulp."

In the lower grade ore equally good re-  
sults were given in the shorter runs. In  
the higher grade ore, the base metals require  
more time for any chemical changes before  
amalgamation can take place.

(To be continued.)

## Notes on Contributions to our Cabinet.\*

We have received from Mr. E. Flanagan,  
of Banner District, San Diego county, a  
piece of gold-bearing quartz from the  
Madden mine in that District. The rock  
shows no free gold, but nevertheless pays  
about \$52.50 per ton at the mill. The ledge  
is about two feet wide, and the rock came  
from the bottom of the shaft—60 feet deep.  
(A communication from Banner District  
will be found in another column).

\*Under this heading we shall continue to mention and  
describe, according to merit, such specimens of ores,  
minerals, fossils, curiosities, etc., as may be sent to us  
by mail or express prepaid. Each article will be num-  
bered, marked with the name of the donor and the  
locality, and placed in our cabinet. A full account of  
the place, occurrence, etc., adds much to the value of  
such specimens.

## An Inventor's Perplexities.

An important suit has been instituted in  
the Fifteenth District Court, by Edward P.  
McCarthy against Chas. T. McDermott,  
H. P. Wakelee and Chas. R. Peters. The  
plaintiff is the inventor of an improve-  
ment in the manufacture of illuminating  
gas and avers that in November, 1869, he  
entered into partnership with the defend-  
ants for the purpose of introducing it on  
the coast. He was to contribute his patent  
right and invention and they a certain  
sum of money to test it, and if successful  
to erect the necessary machinery to bring  
it into use. If carried on, each one was to  
receive one-quarter of the profits. It was  
further agreed that no sale or agreement  
was to be made unless with consent of all.  
On December 5th, 1869, an indenture was  
signed by all parties concerned which  
plaintiff supposed contained all the above  
conditions, but which omitted to state that  
he and defendants were equal partners.

Plaintiff alleges that successful tests  
were made, and that in May 1870, a fran-  
chise was obtained from the proper au-  
thorities of San Francisco, to supply gas  
to the streets of this city. He also says  
that since the tests, the defendants have re-  
ceived various sums of money amounting  
to \$50,000 from other gas companies, in  
consideration that they should not use the  
invention in this city and elsewhere, and  
for sale of patent rights, and that they  
have appropriated the money and refuse to  
account for it or allow him his share. He  
prays that the indenture may be so amend-  
ed as to truly set forth the terms of the  
partnership, that the partnership may be  
dissolved and an accounting had, and that  
he be adjudged entitled to one-fourth of  
the whole amount, which he believes will  
amount to upwards of \$250,000; and fur-  
ther, that by reason of this refusal to ac-  
cede to the terms of the agreement, he may  
recover judgment for \$150,000 damages.

OUR HISTORICAL SKETCH of Knighte  
Ferry, by Mary Jameson Locke, will be  
found very interesting to both old and new  
California residents. It is more than a  
history of the town—it is in part a racy  
delineation of California life.

# HISTORICAL RECORD.

## History of Our Country Towns—No. II.

### KNIGHTS FERRY.

STANISLAUS COUNTY, CAL.

[Written for the Press by MARY JAMESON LOCKE.]

Pen-scratching among the stale and well-forgotten rubbish of dead ages is a grave business and requires a certain style of courage; but a wary and gingerly audacity is much needed by the writer who arrests in mid-career a growing California town, tricks it out with shreds and patches of memory, labels it History, and trots it forth for public inspection.

In near view of this task I shrink and falter. The subject is so young, so alive, so unconscious of impending "treatment," and if Mr. Editor would allow a choice of historical "bones to pick," I would much prefer to serve up ancient Gaul, or sketch the rise and fall of the Tower of Babel; or give an inky outline of that obscurest and busiest of all ferries, that plied on fabled Styx, and whose grim boatman was known to shuddering souls as Charon, son of Erebus and Nox.

Mining towns in California have been addicted to the mushroom habit of springing alert and full-grown upon the world; and this swift surprise of life has so often resulted in equally rapid decay, that the dry bones of scores of California towns and camps now lie bleaching upon the hillsides or grimly desolate in silent valleys.

Luckily for the historian, Knights Ferry has a Past, and several well-defined epochs of normal growth. Doubtless there are many who remember when the town began to cut its eye teeth—wear "store clothes" and deal lavishly in wild oats and other outcroppings peculiar to the period. Possibly there is an "oldest inhabitant" who listened to prehistoric traditions during those early days when there was not much sign of the coming town; merely a "crossing" for the eager throng whose land of golden promise lay beyond. Knights Landing on the Sacramento also owes its name to

Capt. Knight, who left his family there, when in the spring of '49 he "struck out" to prospect the Stanislaus, upon whose banks he pitched the pioneer tent, built the first ferry, started the first hotel, and lay down to rest in the first white man's grave. He had been a famous trapper, hunter, and guide in one or more of Fremont's expeditions. Thus familiar with the country, and directed by native shrewdness, he was led to select this point on the Stanislaus as the natural gateway of travel from the plains to the mountains; for the road would pretty nearly "make itself" all the way from Stockton (36 miles) to Sonora, 27 miles beyond. Here also was a natural water-power where the river came fretting from its rocky cañons and broadened tranquilly between the sloping, sleepy foothills. If he had an eye for beauty he still chose wisely, for until smitten by the swift destruction of mining there could hardly he

found a lovelier nook. Here was "the forest primeval," and a river whose crystal clearness betrayed the whereabouts of glancing trout, and large, fat salmon. In all directions beneath the venerable oaks were

Indian Mounds, ancient and grass-grown, or modern and still swarming with swarthy life; and no evidence was lacking to prove that this had long been a favorite rallying point for Indian tribes, where their harvest of acorns and fish was almost without limit.

Among these Indians was a living bundle of skin and bones, a breathing mummy of a squaw, whose age must have been about 140 years. There were other ancient and dried up samples of Digger longevity, who all declared that when they were youngsters, she was already the oldest of the old; and none who saw her could doubt this, or fail to get some startled notion of a possible "baboon origin."

She mumbled the dim tradition that this smiling valley had once been a great, wide

enterprise. Seeing no tangible "dust" the young man decided it would hardly be safe to test this generous promise, and on he went with his company. But those were the days when capital lurked and gave no sign.

Coming again to prospect the mill-site in 1853 he could join the laugh at his own expense when Capt. Dent whisked from a safe the greatest oddity of an old buckskin bag, (about two feet long and shaped like a gourd with huge pouch at bottom,) and exclaimed:

"There Mr. Locke! when Capt. Knight offered to advance funds to build a mill, he had this packed full of gold dust and no knowing how much more stowed away under his old bunk!"

A business partnership was now formed, and the firm of Locke & Dent proceeded to put in the first permanent dam that ever crossed the Stanislaus.

By June of 1854 their sawmill was running, and about four months later their flouring mill was grinding away upon some of the first wheat ever raised in this region, that has since become almost world-famous for its immense wheat crops.

Agriculture at this time was taking its

one she called "Pudding" and the other she called "Pie." "Pudding" was so very plain that she liked "Pie" vastly better and gave him all sorts of smiling encouragement, but the dapper young clerk was only flirting for fun and she waited in vain for proposals. Finally, she lost faith in "Pie" and astonished her friends by accepting the plain substantial "Pudding."

Doubtless she has found ample verification of the old adage—"The proof of the pudding" etc. etc.

### Mining.

Until 1854 and '55 the "pay dirt" of this vicinity had attracted no general attention. Indians had panned out considerable quantities of gold and a few cradles were rocked on the river-bank. But now began the Ditch mania with Parson's Ditch, that led from the mill-dam along the south bank of the river; Thompson's "Dry Ditch" that yawned for the tardy waters of Littlejohn Creek; and finally the great San Joaquin Ditch that tapped the Stanislaus six miles above the Ferry, and so came broad and deep along the hill-sides or through great flumes that clung to the walls of cliff and rocky cañon. This enterprise was pushed by a stock company with the names of Calloway, Short and Bishop, prominent as superintendents.

As in many costly mining schemes, the projectors were unable to finish the work, and in 1856 Mr. A. Schell of Stockton invested such capital and energy as brought it to completion and also brought him to Knights Ferry as a permanent citizen, where he has ever since been one of the leading spirits in all public affairs and interests of town and county.

With the plentiful rush of water came hundreds of miners to the little town, and its swift, cheap growth betrayed "flush times" and the usual excitement of mining life. Hills and valleys were torn "inside out" and sent whirling into the Stanislaus that now between broken banks rolled sluggishly like a vast stir-about of muddy mush.

Buena Vista and its forest of grand old oaks must also come out by the roots, and so much water would be needed that another great ditch for that side of the river was started by Kappelman & Co.—finally finished by San Francisco capital, and is now owned by the Pentland Bros. Ditch property hereabout cost about a quarter of a million, with continued heavy expense for repair of damages from floods etc.

Big strikes and sudden fortunes were never made here, but if it were possible to compute the whole amount of gold gathered, it would, doubtless, make a fine figure.

For the last ten years the mining interest has steadily diminished—is now nearly forsaken by white men and hardly kept lively by "Heathen Chinese." Mr. McSorley, a veteran miner and pioneer of the town, still toils among the rocks of Goat Hill and deserves mention for the constancy with which he has pinned his faith to Knights Ferry.

In 1857, the town and region roundabout suffered from an affliction sadly familiar to Californians, and many pleasant homes were left desolate in the grasp of a Spanish land grant.

Again the prosperity of the town was seriously checked by the

### Great Flood of '61-'62.

that swept nearly every building from the business part of Main street and lower side of the Plaza, carried away the flour mill, the bridges of Locke & Co., and left a scene of gloom and desolation impossible to describe. Much "portable property" might have been saved; but these modern antediluvians had no faith in a Deluge and while they scoffed at the notion, away went houses, tools, furniture, dry goods, and things too numerous to mention.

Many found perilous excitement in trying to catch and secure a portion of the immense quantity of "drift" that went,

TOWN OF KNIGHT'S FERRY, STANISLAUS COUNTY, CAL.

lake, and the story is also written on the surrounding hills.

A remnant of these Indian tribes may still be found at their rancheria near town. The close contact with civilization has been followed by the usual fatal results.

After the death of Capt. Knight the ferry and belongings were owned by Dent & Vantyne; but the latter—who had been Capt. Knight's partner—soon sold his interest to the brothers, John & Lewis Dent, who were thenceforth, for some years, sole proprietors of the ferry, hotel, and pre-emption claim of land along the north bank of the river.

They also had a little store where another brother had supervision of a retail traffic with the Indians and officiated as postmaster, and "Justice of the Peace." This brother had arrived with his family in 1852; and his wife, Mrs. Geo. W. Dent, was the first white woman who lived at Knights Ferry and enjoyed the luxury of homesickness at the foot of the stony bluff that backs the town. Maj. Lane and family came also in one of those early years, and settled at "Mountain Brow," a few miles below the Ferry.

In later years the Major has been well-known to the traveling public as landlord of the principal hotel in town, and from first to last how many hearts of homeless strangers have been cheered by his kindly hospitality.

With the first company and team that ever made tracks on the direct route from Stockton to Knights Ferry, there was a Yankee machinist who had an appreciative eye for mill-sites, and a keen regret over the busy idleness of a fine water-power running to waste. He talked over the matter with Capt. Knight who strongly urged him to "stake out a claim" on the Stanislaus and put up a saw-mill then and there; offering also to "come down with the dust," that would be needed for the

first timid steps; fruit-culture and gardening had not yet become fashionable in the foothills. Knights Ferry was still a mere stage station, of hotel, store, stable, blacksmith shop, and a few rough cabins and tents, where the usual assortment of culture, coarseness, brains, and brawn, enjoyed the luxury of "roughing it," and cultivated the fine culinary art of frying pork and slap-jacks.

While it was yet hot in the summer of '54, there "might have been seen" sauntering along the crooked trail that led from ferry to mill a quiet, unobtrusive man, who sometimes sought a shady spot where he could comfortably smoke, whittle, watch the mill-wheels noisy whirr, or possibly take a little nap, and dream of future greatness. To some of the citizens he was introduced as

### Capt. Grant;

but not once during his brief visit was he conscious of the vast crowds of people who "saw him there," and who have since turned up in the most unexpected places—chiefly in the vicinity of the White House at Washington.

A "reliable reporter" says that Grant has been making inquiry about this renowned "ferry," and is satisfied there could be no better investment for presidential dollars, provided the rush of "pilgrim strangers" will still compare favorably with the multitude who "saw him there."

The announcement of this shrewd notion has been followed by an ardent wish on the part of the President to visit California and the good people of Knights Ferry, may crack this nut to suit themselves.

An amusing story of Grant's courtship was told by one of the Dent brothers, and in later years has been repeated with great relish by the ardent admirers of "Unconditional Surrender."

"Sister Julia," said he, "had two beaux,

floating by. One poor man ventured too far and also drifted away where no human eye could follow.

The tremendous loss of property was followed by a considerable loss of citizens who became discouraged and sought safer anchorage for household gods.

But California pluck asserted itself as usual and signs of the wreck soon disappeared. The bridge was replaced by a strong and handsome structure that is believed to be flood-proof. The mill was rebuilt of stone by D. W. Tulloch—is still in active operation and doing a large business.

Main street grew up again with shops, stores and dwellings that were partially overflowed and considerably damaged by another flood in the winter of '67-'68. Mining operations have tended to fill up the river bed and increase the dangers of overflow.

Two newspapers had been published heretofore, the *Knights Ferry Bee*, followed by the *Stanislaus Index*, and this latter did not long survive the flood. The town has twice suffered

#### Trial by Fire.

In the summer of '64 several buildings were burned, and notably the old Hotel where stages had stopped ever since "early times." A second fire occurred last August and destroyed seven buildings on the lower side of Main street, viz.: Palmer & Moulton's store; Buddington's saloon; P. Englehart's blacksmith shop; Vogt's shoe shop; A. T. Bartlett's harness and saddle shop; Gardner & McLean's hay barn, with 60 tons of hay, and Kline & Tremayne's butcher shop. New buildings were soon erected and the appearance of the street considerably improved.

But the town suffers further loss since this fire in the departure of Henry Palmer, a tried and true citizen, who has been for fifteen years widely known and respected as merchant, express agent, etc. There now remain but a few of the prominent

#### Pioneer Business Men

of the town and vicinity. C. S. S. Hill at the old familiar store on Main street; James Allen of the early firm of Palmer & Allen, but now of Allen & Clark; Isaac Dakin still at the head of a large wheelwright and blacksmith business; Samuel Dingley, well known to the traveling public; D. Parker, blacksmith; W. E. Stewart, one of the first to engage in fruit culture and still famous for raising the best and earliest peaches in the country.

All these and many others who came at a later date, belong to that desirable class who settled at once to the duties of permanent citizenship.

#### Churches and Schools.

Religious service was of rare occurrence in early days, and was first held in the primitive bar-room; next in the unfinished flour mill of Locke & Dent. Then a worthy itinerant rigged a rough room in one end of a stable and set up his household gods—the fry-pan and battered dough-dish. Here he kept "bachelor's hall," taught the half dozen children on week days and preached on the Sabbath. A slight board partition separated the congregation from a long line of mules, whose response to hymn and prayer was noisy and emphatic.

In 1856 the Rev. James Bishop took charge of church affairs, preaching in the kitchen of S. Bishop, in the shop of McLaughlin & Dakin, and finally organized a Methodist society that met for regular service in the town hall, which was also used several years for school purposes. The court room became in turn the scene of public worship, then Armory Hall, which was finally purchased and fitted up for a church, but went to wreck in the flood of '68, and a neat small church has since been built in a safer location.

Those who are familiar with this sketch will recall the unselfish devotion of Father Bishop to the interests of Church and Sabbath School, and though his kindly face is no longer seen at Knights Ferry, his good works and words will not soon be forgotten.

Within the past year two good school-houses have been built in town; one for the public school of forty scholars, the other for the private school of Mrs. Stakes—twenty scholars.

Buena Vista District has also its neat, new schoolhouse and from thirty to forty scholars.

In 1861 an effort was made to procure a library for the use of schools, and the people responded so generously that a change of plan was made in favor of a

#### Public Library.

This now contains nine hundred well-selected volumes kept in the office of Schell

& Hewell, where may also be found one of the best private law libraries outside of San Francisco.

The existence of this excellent public library is but one among many proofs that the women of Knights Ferry have quietly demonstrated their line of "rights."

In charities, that begin and end at home, and in many enterprises of broader scope, they have shown a capacity for zealous and harmonious co-operation that insures desired results and has never known a failure.

Long may these shining lights be spared to brighten happy well-ordered homes.

#### Fruit Culture.

With ample irrigation nearly all known varieties of fruit may be easily grown, and special attention is now being given to the cultivation of desirable foreign varieties of grapes, that are found to mature here at least two weeks earlier than in any other part of the State.

Large vineyards of home and foreign varieties are owned by Pentland Bros.—Stemm & Gerkins and J. Slook. The Red Mountain vineyard of Schell, Krause & Co. has a well established reputation for excellence of wine and brandy, and promises to yield this year thirty thousand gallons of wine. The products of this vineyard received special praise from the Senate Committee on "grape culture and production of wines and brandies"—(1870) and the method of manufacture pursued here is given in their report.

#### Business Summary, etc.

Knights Ferry formerly belonged to San Joaquin county, was annexed to Stanislaus in 1860, and since 1862 has been the County Seat. The large brick building erected in 1858 by Wm. A. Fisher, was purchased by the county, and now contains the court room, offices and jail—also the Knights Ferry Hotel," kept by Bishop and Gardiner. The Washington Hotel on Main street, is kept by F. S. Barnes.

Of law firms there are (A.) Schell & Hewell—(G. W.) Schell and Scrivener and T. A. Caldwell.

Doctor James Lowe, and Dr. Marks, who has charge of a county hospital recently established.

Merchants, Hill & Warner Bros.; Allen & Clarke; J. Haslach & Co.; Moulton & Valpey; these last are also agents for Wells, Fargo & Co.

Wheelwrights and Blacksmiths, I. Dakin; J. L. Conner and P. Englehart.

Saddle and Harness Maker, A. T. Bartlett.

Carpenters, E. T. Stone, D. Gillis.

Boots and shoes, K. Vogt, G. Gule.

Livery stables, Gardiner & McLean, L. Voyle.

Saloons, H. K. Covert, J. D. Buddington, and E. J. and J. Loddman who also own a brewery.

Toy and fruit store, James Simpson.

At the upper end of Main street is the fine large flour mill of D. W. Tulloch with its four run of stone, busy day and night.

On the upper side of the Plaza a neat Masonic hall has been recently built. In the lower story of which is the apothecary shop of T. M. Lane.

The hotel of S. Dingley, blacksmith shop of D. Parker, harness shop of Mr. Foster, and store of Randall & Stewart, are in Buena Vista. On both sides of the river are pleasant cottages with home-like surroundings; and remembering these, no faithful historian can forget the generous hearts and ready hands that have helped to establish whatever is "lovely and of good report" in this community.

The business of the town shares in the general depression resulting from the drouth. The grain crop in the southwestern part of the county is a total loss. A belt of country about fifteen miles wide skirting the foothills yields a fair crop. Threlfall & Bros. have a wheat field of 8,000 acres near the town, and on Dry Creek another of 3,000. They get about half a crop.

The business of wool-raising assumes considerable importance in the county, and here largely engaged in it are Dingley & Enslin, T. P. Cary, and William Bach. A woolen factory is talked of, and the still abundant water-power suggests a promising future for the town.

One more backward glance through these eventful years reveals many a dark blot of tragedy, pitiful or criminal. Accident and crime have made their fearful record—but there is no need to recall it. Let it rather fall silently away among the shadows of the Past, while the town in its twenty-second year turns a new leaf and writes a fresh, fair page.

A swarm of bees at Janesville, Wisconsin, made fifty-three pounds of honey in fifteen hours.

## DOMESTIC ECONOMY.

### Economy in Selecting Carpets.

In selecting carpets for rooms much used, it is poor economy to buy cheap ones. Ingrain carpets, of close texture, and the three-ply carpets, are best for common use. Brussels carpets do not wear so long as the three-ply ones, because they cannot be turned. Wilton carpets wear badly, and Venetians are good only for halls and stairs.

In selecting colors, avoid those in which there are any black threads; as they are always rotten. The most tasteful carpets are those which are made of various shades of the same color, or of all shades of only two colors; such as brown and yellow, or blue and buff, or salmon and green, or of all shades of green, or of brown.

In laying down carpets, it is a bad practice to put straw under them, as this makes them wear out in spots. Straw matting laid under carpets makes them last much longer, as it is smooth and even, and the dust sifts through it. In buying carpets, always get a few yards over, to allow for waste in matching figures. In cutting carpets, make them three or four inches shorter than the room, to allow for stretching. Begin to cut in the middle of a figure, and it will usually match better. Many carpets match in two different ways, and care must be taken to get the right one. Sew a carpet on the wrong side, with a double wax thread, and with the hall-stitch. This is done by taking a stitch on the breadth next to you, pointing the needle toward you; and then taking a stitch on the other breadth, pointing the needle from you. Draw the thread tightly, but not so as to pucker. In fitting a breadth to the hearth, cut slits in the right place, and turn the piece under. Bind the whole of the carpet with carpet-binding, nail with tacks, baying bits of leather under the heads. To stretch the carpet, use a carpet-fork, which is a long stick, ending with notched tin, like saw-teeth. This is put in the edge of the carpet, and pushed by one person, while the nail is driven by another.

Straw matting is best for chambers and summer parlors. The checked, of two colors, is not so good to wear. The best is the cheapest in the end. When washed, it should be done with salt water, wiping it dry; but frequent washing injures it. Bind matting with cotton binding. Sew breadths together like carpeting. In joining the ends of pieces, ravel out a part and tie the threads together, turning under a little of each piece, and then, laying the ends close, nail them down with nails having kid under their heads.—Miss Beecher.

### TO PREVENT FLANNELS FROM SHRINKING.

In washing flannels, or other woollen articles, have the suds ready prepared, by boiling up and so dissolving small pieces of soap in rain-water, without soda; but do not use the suds when boiling; let them be lukewarm only when the articles are put in. The flannels should not be rubbed with a large piece of soap, nor should the material itself be rubbed as in washing linen, etc.; the fibres of the wool contain numberless little hooks, which the rubbing knots together; hence the thickening of the fabric, and consequent shrinking in dimensions. Well sluice the articles up and down in plenty of suds, which afterward squeeze (not wring) out. The clothes wringers, consisting of a pair of India rubber rollers, between which the clothes pass, are a great improvement upon hand labor—as, without injury to the fabric, they squeeze out the water so thoroughly that the article dries in considerably less time than it otherwise would do. After rinsing, squeeze out the water and dry in the open air, if the weather is such as to admit of the articles drying quickly; if not, dry in a warm room, but avoid too close proximity to a fire. Let any dust or mud be beaten out or brushed off prior to washing.

FRICASSEED CHICKEN.—Cut up the chicken, and boil with a slice or two of pork, in sufficient water to cover, till quite tender. Fry some pork, and when cooked a little, drain the chicken, and fry with the pork till quite brown. Then take out, and pour the broth into the frying-pan, with the pork fat, and make a gravy, thickened with brown flour; season well with butter, and put the chicken into the gravy. Be sure and have the fat quite hot when the chicken is put in, so it will brown readily.

### Eggs vs. Meat.

Would it not be wise to substitute more eggs for meat in our daily diet? About one-third of the weight of an egg is solid nutriment. This is more than can be said of meat. There are no bones and tough pieces that have to be laid aside. A good egg is made up of ten parts shell, sixty parts white, and thirty parts yolk. The white of an egg contains eighty-six per cent. of water; the yolk fifty-two per cent. The average weight of an egg is about two ounces.

Practically an egg is animal food, and yet there is none of the disagreeable work of the butcher necessary to obtain it. The vegetarians of England use eggs freely, and many of these men are eighty and ninety years old, and have been remarkably free from illness. A good egg is alive. The shell is porous, and the oxygen of the air goes through the shell and keeps up a sort of respiration. An egg soon becomes stale in bad air, or in air charged with carbonic acid.

Fresh eggs are most transparent at the center, old ones on the top. Very old ones are not transparent in either place. In water, in which one-tenth of salt has been dissolved, good eggs sink, and indifferent ones swim. Bad eggs float in pure water. The best eggs are laid by young healthy hens. If they are properly fed, the eggs are better than if they are allowed to eat all sorts of food.

Eggs are best when cooked about four minutes. This takes away the animal taste that is offensive to some, but does not so barden the white or yolk as to make them hard to digest. An egg if cooked very hard is difficult of digestion, except by those with stout stomachs; such eggs should be eaten with bread and masticated very finely.

An excellent sandwich can be made with eggs and brown bread. An egg spread on toast is food fit for a king, if kings deserve any better food than anybody else, which is doubtful. Fried eggs are less wholesome than boiled ones. An egg dropped into hot water and left till properly cooked, is not only a clean and handsome but delicious morsel. Most people spoil the taste of their eggs by adding pepper and salt. A little sweet butter is the best dressing. Eggs contain much phosphorus, which is supposed to be useful to those who use their brains much.—*Herald of Health.*

MANUFACTURE OF SODIUM.—An English magazine proposes a highly original method for the manufacture of sodium, on a large scale, that deserves to be tested. The vapor of chloride of sodium produced by passing hot air through melted salt is conducted over quartz or feldspar heated to whiteness. Chlorine gas is evolved, which can be economized in the manufacture of bleaching powders while the silica takes the soda in the form of silicate. The silicate of soda is afterward decomposed by heating it with lime and charcoal, and passing carbonic gas over it, as a reducing agent, producing silicate of lime and vapor of sodium, which latter must be condensed in naphtha.

If silicate of soda can be economically prepared in this manner it is a question whether the process could not be employed as a step in the manufacture of soda ash in preference to the famous invention of La Blanc.

BAKED PEACHES.—Cut the peaches in two, remove the stone, having first wiped the fruit well. With a paste cutter (if you want something fanciful, otherwise simple squares will do,) cut some slices of bread. On each piece place half a peach, skin side down, dust well with sugar, put a tiny piece of butter on each, and bake slowly. When done, dish them and turn the juice over, if any. Otherwise add syrup of peare and serve warm. Apricots and plants may be served likewise.

KANGAROO SOUP.—Ever since the establishment of English colonies in Australia, the excellence of the flesh of the kangaroo has been universally recognized. The tail is very muscular and fleshy, and soup made from this part of the animal is regarded as particularly rich and nourishing. Kangaroo tails in a perfectly fresh state are sent to England in hermetically sealed tins, and are sold under the name of kangaroo venison.

MEDICINE STAINS.—Medicine stains may be removed from silver spoons by rubbing them with a rag dipped in sulphuric acid, and washing it off with soap suds. It is much easier to remove the medicine stains from silver spoons, than from the body. The latter are rarely ever wiped out.

EVERY USER OF STEAM POWER SHOULD HAVE  
BELLIS' PATENT GOVERNOR.  
It is the CHEAPEST and BEST Regulator for Steam  
Engines known to mechanics.  
We offer SPECIAL INDUCEMENTS to Engine Build-  
ers. 427 Address for Circular and Price List, SINKER,  
DAVIS & CO., Indianapolis, Ind. au5-13w

STEPHENS & CO.,

MANUFACTURERS OF

U. S. STANDARD BOXWOOD AND  
IVORY RULES.

ALSO EXCLUSIVE MANUFACTURERS OF

L. C. Stephens' Patent Combination Rule.

This cut represents the COMBINATION RULE, which  
comprises a Foot Rule, Spirit Level, Try Square, Bevel,  
Plumb, Slope Level, Etc.  
It is made of the very best quality of Turkey Boxwood,  
heavily bound with brass, and is graduated with mathe-  
matical accuracy.  
The Square is adjustable, and can be tested and made  
perfectly true by the aid of a small screw-driver, but  
this is seldom required.  
In its application as a Slope Level it is especially  
adapted for Miners' use, as it shows the pitch to the  
foot, and DEGREE OF INCLINATION at once. It is six  
inches long when folded, by one and three-eighths wide,  
and three-eighths inches thick, the cut being just one-  
fourth size.  
By the use of one of these, a builder, mason, car-  
penter, or other workman, can always have in his pocket  
the most valuable of his apparatus used in construction,  
combined in a portable, useful and cheap form. "Scientific  
American."  
Price by mail, prepaid, \$4. For agents' terms, address  
STEPHENS & CO.,  
10-v23-3m Riverton, Conn.

DENSLAW & BUSH'S "SAFETY" OIL

SAFEST OIL  
KNOWN.  
Will Not Explode!  
Stands a fire test over 19°  
Fahrenheit. We take ordi-  
nary Kerosene 110° fire test,  
and re-distill it by our new  
process, rejecting fully 1/2  
(Benzine and Tar), the cause  
of all Kerosene explosions,  
bad odors, smoke, gas, etc.  
Our "SAFETY" Oil costs 1/2  
cent per hour, and a lighted  
lamp may be used and broken  
without fear of explosion  
or fire. The Fire Underwriters of N. Y. recommend its use  
as a protection to life and property. For sale by all grocers,  
druggists, etc. in the U. S. Extra inducements to dealers  
and agents. Address Denslaw & Bush, 130 Maiden Lane,  
N. Y.; 8 Custom H. street, Boston, Mass.; 34 S. Calvert  
street, Baltimore, Md.; 31 S. Water street, Chicago, Ill.; or  
Cleveland, Ohio. P. S. - 5 gallons expressed for \$3 to any  
place where not for sale. 8-v23c

Longshore's Combination Tool.

This device is just what its name indicates. As a  
KITCHEN TOOL it is indispensable. It will fit and lift  
with perfect safety, any Stove Lid, Frying Pan, Pie Pan,  
Pot, Kettle, or any other vessel or dish used about a  
stove. It is a complete tool for stretching carpets,  
driving tacks, pulling tacks, &c., &c. It answers the  
double purpose of hammer and pincers, and is also a  
good Nut Cracker. It is made of the best malleable  
iron, and the Hammer, Pincers and tack puller, are all  
hardened so as to stand the roughest usage. An Agent  
is wanted in every town on the Pacific Coast to sell this  
valuable little implement. Retail price, fifty cents.

WIESTER & CO.,  
17 New Montgomery street (Grand Hotel),  
SAN FRANCISCO.

## ON THE ASSAY OF GOLD.

BY HENRY G. HANKS.

[Expressly for the Press.—Continued.]

When several assays of gold bullion are to be made together, the plan of operation is somewhat modified. Let it be required to conduct nine assays at once. Certain tools and appliances will be necessary which have not yet been described.

A piece of hard wood is made about four inches square and an inch in thickness. On one side a portion of the wood projects to serve as a handle; nine half inch holes are bored in the square part nearly through the thickness. On the under surface in each corner a small knob is screwed which serves as feet to raise the board above the table. In each of the holes is to be placed a tube of glass closed at one end. The other end is cut off square and ground flat on a grind stone or emery wheel. The size of the tubes is such that they can be easily removed and replaced in the holes. The tubes are a little more than an inch long, so that they can be easily grasped with the finger and thumb when it is required to remove them from the holes.

Each of the tubes are marked with a letter of the alphabet from A to I inclusive. This may be done with a writing diamond or with a corner of a freshly broken file. Near each hole is also stamped a letter, using the same set as those marked on the tubes. For want of a better name let this be called a "tube rack."

On commencing the assay the bars are first to be stamped with the running number of the assays, to correspond with the entries in the record book of the assay office. Similar entries are then made on a small memorandum book and to each entry the letters are added, thus, No. 794, A.—No. 795, B.—No. 796, C.—etc. The bars are then all taken to the anvil and assay chips are cut from them, or borings taken in the manner before described.

The clippings from the bar stamped 794 must be put into the tube marked "A," which is then placed in its proper hole. Those of 795 in the tube marked "B," etc., etc. The bars are then set aside and the tube rack taken to the balance. Here other pieces of apparatus will be required. A square block of wood with a single hole bored in it the same size and depth of those in the tube rack, and another square piece of wood with handle of the same size and thickness as the tube rack; but instead of holes, nine hemispherical cavities are cut, each of which is about an inch in diameter, and half an inch deep. These cavities are marked with the same letters and in the same succession as those of the tube rack.

The tube marked "A" is lifted from the rack and placed vertically in the hole in the block, which serves for a temporary stand for it. The clippings that are contained in it must previously be poured out on a clean piece of paper placed for convenience inside the balance case. After the assays are weighed out the remaining gold is put back into the tube rack. The assays in their leaden envelopes are placed in the cavity marked "A." "B" is then treated in the same way, and so on through the whole set.

Nine cupels are then marked and placed in the muffle in the same order and with the same letters. The object of marking the cupels is, that it is sometimes necessary to change their position in the muffle. And sometimes even to take one or more of them out, before the others are finished.

The manner of marking the cupels is as follows: Some red chalk is ground fine, mixed with water and kept in a small wide mouthed bottle for use. When it is required to mark cupels, the contents of the bottle are mixed and applied with a small camel's hair brush. The cupels should be marked on two sides.

When the cupels are taken from the muffle, they are placed in a rack of sheet iron divided into nine compartments, and when the buttons are removed they are placed back into the cavities in the board from which they were taken when placed in the cupels. This serves to convey them to the balance when they are weighed, alloyed with silver and returned to the muffle for second cupellation. It will be seen that to this stage the assays are always kept in compartments bearing their mark, and with ordinary care no mistake can occur.

When the assays are alloyed with silver and rolled out, a letter is stamped on the end of each, somewhat deeply. The assay is then rolled up in spiral form in the usual manner commencing at the end which is not stamped. This letter will be as distinctly seen after boiling in acid as before. The cornets are then placed in flasks, boiled with acid and dried in the usual manner.

It has been recommended to place all of the cornets in one flask and after boiling, to invert it in a somewhat capacious dish of water; to pick out the cornets with a pair of forceps, and to anneal them altogether in the muffle on a tile. I have never tried it, but I consider it to be unsafe, as with the best of care the cornets are sometimes broken in the boiling. The elegant plan of boiling a number of cornets in baskets

of platinum wire, in the same vessel, is open to the same objection.

The manner of using the proof is as follows: first consider what will be the average fineness of the assays you are conducting. Your preliminary assays will furnish you the data. Let it be supposed that this average will be .950 weigh out 950-thousandths of pure gold, alloy it with 2½ its weight of silver and cupel it in the muffle with the nine assays, boil with the same acid, and under exactly similar circumstances, heat it to redness in a dry cup and weigh it. It will generally be found to have increased in weight owing to the surcharge being in excess of the mechanical loss. What the proof has gained in weight must be subtracted from the other assays, when many assays are to be made from the same mine; an alloy of copper, silver and pure gold must be made up as nearly identical as can be with the composition of the bullion, and this alloy used as a proof. Of course a full unit must be employed in this case.

There are a few points to be borne in mind in making the bullion assay to insure success. The alloy of gold and silver should not be rolled out too thin as it is likely to be broken when this precaution is disregarded.

The cornet must never be weighed without being heated to redness. Simple drying will not give correct results.

In boiling with acid, the flasks should be turned on their sides at an inclination of 45° to prevent loss of acid in the event of sudden ebullition.

A graduated measure should be used for the acid, that the amount put in each flask shall be equal.

Common water should never be used in washing the cornet, as chloride of silver is formed in the pores of the gold, which cannot be removed, and which being insoluble in acid remains in the cornet and gives incorrect results.

Gold is always weighed in Troy ounces and decimals. It is best to have the ounces in decimals also. A convenient set should be constructed as follows:

Ounces.	Decimals
500	0.500
300	.300
200	.200
100	.100
50	.050
20	.020
10	.010
5	.005
2	.002
1	.001

Before using a set of weights they should be tested for accuracy, and compared with a standard set.

Although it is better to be provided with a full set of weights and a good bullion balance, still it is possible to weigh very closely with a set of 20 ounces and decimals, and a set of avoirdupois pounds on a good common balance, by counterpoising, which has been before described. Each pound avoirdupois is 15.5833 Troy ounces. What the bar lacks of a pound must be made up with Troy ounces and decimals. The number of pounds is to be multiplied by the factor given above and this sum added to the ounce weights used to complete the weighing. The result will be the weight of the bar in Troy ounces and decimals. Of course the pound weights must be examined and their accuracy verified.

It may sometimes be interesting to know the relation between the fineness of gold and its value in carats. Pure gold (1000 fine) is said to be 24 carats fine, 12 carats would evidently be 500 fine or one-half gold—all gold is so computed in England, the standard being 22 carats; gold of 23 carats is said to be one carat "better" as 21 would be one carat "worse."

The following table will show the relative value:

Carats.	
1	0.041667
2	.083334
3	.125001
4	.166667
5	.208333
6	.250000
7	.291666
8	.333333
9	.374999

11	.458333
12	.500000
13	.541667
14	.583333
15	.625000
16	.666667
17	.708333
18	.750000
19	.791666
20	.833333
21	.874999
22	.916667
23	.958333
24	1.000000

**ANTI-SCALE COMPOUND.**—We would call the attention of engineers and others to the advertisement, in another column, of Rickard & Durden's Anti-Scale Compound, one of the most valuable preparations for the purpose intended, which has ever been presented to the public. A full notice of this preparation was given in the SCIENTIFIC PRESS about three months since.

**A CANDIDATE.**—Mr. Ira H. Reed, of West Point, Calaveras Co., an old subscriber and reliable correspondent of the SCIENTIFIC PRESS, announces to us that, although no politician, he is a candidate for engrossing clerk of the next State Assembly.

## Removal.

The entire business office of the SCIENTIFIC PRESS, PACIFIC RURAL PRESS, and our U. S. and Foreign PATENT AGENCY and ENGRAVING establishment, has been removed to No. 338 Montgomery street, on the southeast corner of California street, diagonally opposite Wells, Fargo & Co.'s.

**COMBINATION GRAIN HARVESTER.**—B. F. Cook, of Napa, the inventor of several interesting machines, (some of which have been patented) has combined a Haines' header with a Pitts' thresher, and a portable threshing engine, whereby he cuts the grain in the field, threshes, cleans and sacks it in one operation. His model at the State Fair showed the plausibility of his plan in theory. He adjusts the machinery so that all the work of cutting, threshing and cleaning can be done by the power of the engine if desired, so as to leave no work for the teams, but to draw the machine. He has an ingenious method of leveling parts of the machine, whereby the engine and boiler can be kept constantly level over uneven or sideling ground. Working experiments in the field have convinced Mr. C. that his machine is practical, and we hope we will find ample means to help him demonstrate most speedily its value. His machine is calculated to cut 18 feet wide.

**"ABOUT THE LOSS OF QUICKSILVER."** The communication under the above title, which appears on the third page of the present issue, found its way there through inadvertence. The writer evidently misunderstands both the nature of the information asked for by Mr. Paul, and the object in seeking that information; and we presume no miner will be so misled as to suppose that Mr. P. has any other object in view in seeking for the information than the general benefit of the miners themselves.

**THE GOLDEN STATE Iron Works** (co-operative) are putting up a number of Stevenson's mouldboard plows of a large size, and some eight-foot settlers, for the Metropolitan Mill and Mining Co., Eureka, Nevada. They are also making some large hydraulic and screw presses for the vineyards of Eberhardt and Lachman. The castings and condensers for the Knox and Osborne's Patent Furnace for the Phoenix Quicksilver Mine in Pope Valley, Napa Co., are under way. The men are also at work on large quantities of White and Grey Iron castings for stamp and pan shoes and dies.

**IMPORTANT WATER SUIT.**—A suit involving the title to certain water privileges, was decided last week by Judge Field. The action was brought by the City of Gold Hill Water Co. to enjoin the Cole S. M. Co. from certain water privileges. A temporary injunction was allowed by the United States Circuit Court. The case was subsequently heard by Judge Field, Associate Justice of the U. S. Supreme Court, who made an order dissolving the injunction, leaving the Cole S. M. Co. in possession of their privileges.

## State Fair Gold Medals.

By an advertisement in RURAL PRESS it will be seen that all claimants to the State Agricultural Society's Gold Medals are required to furnish statements relative to the manufacture or production of the articles exhibited, and on which they claim the award of the medal, or upon which they base their claim of merit.

**THE SAN FRANCISCO GLASS WORKS**, situated on King street near Fourth, in this city, commenced operations again on the 12th inst. Mr. Newman, who is in charge, informs us that everything is now in readiness for orders in this line.

**AVERILL'S CHEMICAL PAINT.**—An advertisement of this valuable product will be found in another column. This is the same paint of which we gave a lengthy description in our last week's issue.

Complete Volumes of the Scientific Press from January, 1864, can be had at this office at \$3 per volume. Bound in cloth, \$5. A limited number only on hand.

**COUGHS.**—THE ADMINISTRATION OF MEDICINAL PREPARATIONS in the form of a lozenge is of all modes the most eligible and convenient, more especially as regards a COUGH REMEDY. "Brown's Bronchial Troches," or Cough Lozenges, allay irritation which induces coughing, giving instant relief in Bronchitis, Hoarseness, Influenza, and Consumptive and Asthmatic complaints.

Opera Glasses, Pebble Spectacles, and Eyeglasses, in great variety, wholesale and retail. C. MULLER, Optician, 205 Montgomery street, Russ Block, San Francisco. 7v23-3m

## Scientific and Practical BOOKS

## MINING, METALLURGY, ETC.

BY GUIDO KUSTEL

MINING ENGINEER AND METALLURGIST.

Published and Sold by DEWEY &amp; CO.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick-silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his speciality. Price \$2.50 coin, or \$3 currency, postage free.

**Concentration of Ores** (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid.

**Nevada and California Processes of Silver and Gold Extraction**, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, \$5 in cloth; \$6 in leather—coin. For single copies of the above works, or for the trade, address

732 Montgomery street and 335 Pine street, OCL4-51 SAN FRANCISCO.

## BETT'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, THAT BETT'S NAME IS ON EVERY CAPSULE he makes for the principal merchants in England and France, thus enabling vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said the Capsule are not used merely for the purpose of the ornament but that they are serviceable in protecting the wine from injury, and insuring its genuineness. By order of the Board of Trustees.

Office, Room No. 28, 419 California street, San Francisco, California. oct-24d

## PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature. The timber used is placed so directly in the line of strain, that less material is required to support the same load. It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN. Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition. Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

F. MALOON, Secretary.

W. H. GORRILL, President.

## Piermont Milling and Mining Company—

Location of works, Piermont Mining District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the fourth (4th) day of September, A. D. 1871, an assessment (No. 1) of one dollar and twenty-five cents, per share was levied on the capital stock of said company, payable immediately, in U. S. gold coin, to the Secretary, at the office of the company, 48 California street, San Francisco. Any stock upon which said assessment shall remain unpaid on Monday, the 8th day of October, A. D. 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before the hour of 2 o'clock p. m. of Wednesday, the 8th day of November, A. D. 1871, will be sold to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

J. W. CLARK, Secretary.

oct-4w

POSTPONEMENT.—The day for deeming stock delinquent on the above assessment is hereby postponed until Thursday, the 9th day of November, A. D. 1871, and the sale thereof until Friday, the 8th day of December, A. D. 1871. By order of the Board of Trustees.

Under a Burning Sun, where Bilious affections and Fevers of various descriptions so generally prevail, Tarrant's Effervescent Seltzer Aperient

Has been successful beyond all parallel. Hence the physicians of the tropics give their emphatic sanction, prescribing it in preference to every other aperient in use. The patient, of course, gladly acquiesces, for this preparation is one of the most delightful, as well as mild and cooling cathartics, chemistry has yet devised, and possesses every medical virtue of the far-famed German Seltzer Spa. It is a powder that only requires the addition of water to produce in an instant a delicious effervescent beverage, as well as an invaluable medicine. Ask for and accept none but the genuine.

SOLD BY ALL DRUGGISTS.

## WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Oam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbag," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation.

For further particulars address

FURMAN K. WILSON,

San Francisco.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, COR. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION.—D, is a glass chamber which contains the lubricant. G is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted siphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the ejection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. 14v15-1f

# THE PATENT Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

# HUGHES' PATENT REMOVABLE GLOBE LANTERN.

Since the time when King Alfred made the first lantern by surrounding a candle with a transparent casing of horn, this class of appliances has been one of the greatest utility and most extended use. Among the latest improvements in its construction is that illustrated in the accompanying engravings, and designed to secure the threefold object of providing for the easy cleansing of the glass portion, the secure retention of the upper in place upon the lower part of the lantern, and the affixing of the handle to the top of the lantern in a durable and efficient manner. The base of the lantern is provided with the usual detachable lamp, and at one side has hinged to its upper edge a wire frame designed to carry and protect the glass portion or body of the lantern, and at the upper end of which is the cylindrical top, perforated in the ordinary manner to permit the escape of the products of combustion from the lamp. Arranged at that side of the base opposite the hinge is an angular spring-catch so applied as to catch over the annular lower rim of the wire frame, and in conjunction with the hinge, to hold the said frame firmly in place upon the base as required when the lantern is in use.  
This Lantern is offered as

The Best and Most Desirable in Use,  
all things considered. Its price is reasonable, and when once tried no other will be accepted.  
Individuals, Dealers, Railroad Companies, and all persons and institutions about to purchase Lanterns, should inquire for this kind; and if not for sale in your locality, address the inventor for circular of full description, price list, etc.  
Patented August 10 and December 28, 1869, by  
**JOHN HUGHES.**  
Address 1811 Sidney street, East Birmingham, Pa.

26 Bond street, New York.  
Platinum Scrap and Ore purchased. 22v18t

**Varney's Patent Amalgamator.**  
These Machines Stand Unrivaled.  
For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repair. The constant and increasing demand for them is sufficient evidence of their merits.  
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.  
This Amalgamator Operates as Follows.  
The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular row between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.  
Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.  
Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

**GOLD-SAVING**  
**Silver-Plated Amalgamating Plates**

## AN INVENTOR'S OPINION.

SACRAMENTO, Oct. 7, 1871.—Messrs. DEWEY & Co.—Dear Sirs: My patent for casting Aluminum Dental Plates came duly to hand. It seems to me to be complete in all its parts. In view of the fact that there are already about five patents for casting this metal into Dental Plates, I think the case has been well handled. For this and for your forbearance in my over anxiety, receive my hearty thanks. F. M. SHIELDS.

Office or Shop Room  
TO LET.

Two Rooms (or one large room), with sunny front, to let at favorable rates at 414 Clay street. Enquire at this office or on the premises.

## IMPORTANT TO MINERS.

A CHEAP AND DURABLE DEVICE FOR SAVING FINE GOLD AND QUICKSILVER.

Frey's Improvement on Evans' Under-current Sluices.

This is a sluice made of cast-iron, with transverse corrugations on the bottom, semi-circular in shape and three inches deep. At the bottom of each alternate corrugation is a narrow slit through which the heavier material falls down into another riffle below with larger corrugations. Both riffles are set on the same grade, which should be about one foot in twelve. The lower box is charged with quicksilver. These Sluices do not clog, nor do they require any attention beyond cleaning up once a week. These sluices have stood the test of use in quartz mills below all the contrivances for saving gold and have made large returns of gold, silver, concentrated sulphurets and quicksilver, that would otherwise have been lost. From the Green mine, Ophir District, Placer county, I have received the following certificate:

Ophir, August 5th, 1871.

Dr. Jos. M. Frey—Dear Sir: Having been engaged as amalgamator in Green & Co.'s mill, where we are using the Hepburn pans and settler, and having below the settler a set of Frey's Under-current Sluices and Riffles, I am well satisfied, after some sixteen years experience in the use of various modes and machines for amalgamation of ores, that your Riffle is capable of concentrating and saving most of the fine quicksilver and light amalgam, in which consists the great source of loss by every known process of working ore.

(Signed) Yours respectfully, J. R. MORRIS. Also, from E. N. Riette, of Nevada Metallurgical Works, 21 First street, San Francisco:

Dear Sir: Having had opportunity to watch your Corrugated Riffles, in operation for over a month at Reno, I can say that these Riffles work splendidly as quicksilver savers and concentrators of unroasted ore. I have also no doubt that they could save very fine gold, as for instance in black sand or slimes, better than any like apparatus in use. Respectfully, (Signed) E. N. RIETTE.

Assay of tailings saved at the Rhode Island Mills, Nevada, by these Sluices:

Gold.....\$75 24  
Silver.....76 96  
Quicksilver.....260 lbs. to the ton  
This was the saving of one week.  
For further particulars address WATERS & CO., No. 54 J street, Sacramento, the Agent for the State. se23-3m

## AMMONIACAL PREPARATION

—FOR THE—

## Prevention and Removal of Boiler Scale.

MANUFACTURED BY THE

San Francisco Gas Company.

F. I. CURREY, Sole Agent, San Francisco Boiler Works, 123 and 125 Beale street, San Francisco.

This Preparation is proved by the experience of many of our best machinists and engineers to be a perfect cure for the vexatious and dangerous incrustation known as Boiler Scale. It is sold in 5-gallon cans at \$5.25 per can, or in cases of two cans each at \$10.50 per case.

The San Francisco Gas Company also manufactures

Carbonate of Ammonia.

Muriate of Ammonia.

Sulphate of Ammonia.

Liquor Ammonia, Concentrated.

Aqua Ammonia, F. F. F.

Concentrated Crude Ammonia, for Ice Making and other manufacturing purposes.

9v23-3m

## The California Powder Works

No. 314 CALIFORNIA STREET,  
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

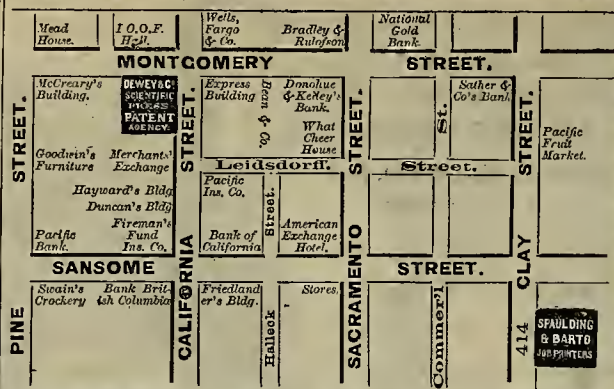

A circular containing a full description of this Powder can be obtained on application to our Office. 16v20-3m JOHN F. LOISE, Secretary.

Having Removed, Oct. 1, 1871, to more pleasantly and centrally located quarters, we shall be pleased to receive our friends and patrons at our new location, designated on this diagram.

(JOHN L. BOONE, A. J. DEWEY, W. B. EYER, GEO. H. STONG.)

## Hoskin's Patent Little Giant Hydraulic Pipe Joint and Nozzle.

PATENTED JULY 19, 1870.

The Best Hydraulic Machine is the LITTLE GIANT. If you want one, get it, and if it don't suit, return it. Full protection guaranteed in the use.

I will defend all suits from others for infringement, and will prosecute all parties found infringing my patent. Send for circular, etc., to

R. HOSKIN, Dutch Flat.

## THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER.

Somewhat slower in its Explosion, which we recommend for

BLANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price, 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

## INTRENCHING TOOLS.

In an article in the *Engineer* which refers to the growing improvements in musketry fire, and the consequent imperative demand in military operations for such shelter as can be obtained by pits and trenches, there is a description, which we transfer, of a combined spade and pick invented by Captain Stewart Harrison, of the First London Engineers. The tool itself is represented in Fig. 1, in which it will be seen that the pick and spade are hinged at their junction, so that when the spade is in use the pick lies in a groove in the handle of the tool, surrounded and secured by a telescopic sheath. When the pick is to be used, it is turned on the hinge till it and the spade are at right angles to the handle, in which position it is also secured by the telescopic sheath. The tool is also intended to serve as a mantlet in combination with the earth thrown up. This use is illustrated by Figs. 2, 3 and 4.

Embrasures are prepared in the earth-work by building up in it funnels made by rolling up a fabric composed of cloth with strips of wood attached, or made up of telescopic sections of zinc or thin iron, like a pocket drinking cup without a bottom. In rear of this funnel or embrasure is placed the spade, the pick being thrust into the ground. The spade is pierced with a circular hole through which to fire, and, in fact, it plays on a small scale the part which the large iron-plated shields are intended to play at Gibraltar, Portsmouth and elsewhere.

The *Engineer* refers in the same article to the spade-hayonet of Lieut. Rice, U. S. A., which was submitted to and approved by the military board that assembled a few months ago at St. Louis, Mo., and of which we also give an illustration in Fig. 5. Capt. Harrison's tool is thought by the *Engineer* too cumbersome to be carried by troops, and that Lieut. Rice's bayonet is not equal to work on hard ground. We think the latter objection more pertinent to Capt. Harrison's, which must be very liable to give out at the joint if subjected to hard usage.

## Silver in Placer County.

We were shown this week some fine specimens of wire and horn silver from the Elizabeth lode worked by the Bellevue Company, near Auburn, California. The mines in this section are looking up, and recent developments show that there is yet much to be expected from there. In one of the veins of the Elizabeth is a stratum containing native silver, the next gold, and a third blue sulphurets of silver with galena and a small percentage of gold. The fact of horn and wire silver being found in this state, is something unusual, and will be looked to with interest. The Bellevue Company have some rich mines in Placer County, the workings of some of which we propose shortly to illustrate.

THIRTY-NINE American vessels were wrecked in September.

## About Patent Laws.

While the United States can boast of having the most liberal laws, with reference to patents in the world, England, on the other hand, must be credited with imposing the heaviest taxation, and the most burdensome regulations upon inventors, and this in the face of the rapid strides which the United States has made during

now amount to \$850 for a fourteen years' patent, to a more moderate and reasonable sum, and to apply the proceeds for the same purpose that it is used in the United States.

When once England shall have accomplished this reform, all of her colonies will undoubtedly follow suit, so that thereafter the inventor who shall produce a valuable invention will be able to secure himself,

It is seldom that foreign inventors take out British patents under the present system, consequently the number of patents is not so great as with us. Englishmen are compelled to pay higher prices for the patents which they purchase from the fact that they do not have a large number to choose from as is the case in the United States.

British patents, consisting of two immense parchments, and the Great Seal of the Crown, composed of some two pounds of ordinary yellow beeswax, on which our inventors pay \$5 expressage, is an amusing affair to Americans, who do not care to be loaded down with such extraordinary documents and ornamental (?) appendages. Compared with our American patent of letter sheet size, it is a monstrosity.

The blue pamphlets which contain printed copies of English specifications, and which are furnished at a six-pence each, including postage, is a more convenient and useful document.

## SIGNS OF RAIN.

There are many signs of early and free supplies of rain. In the mountains and mining districts of Nevada the streams are reported rising in consequence of the diminution of evaporation. There have been in some districts considerable falls of snow, as well as on the plains, and showers in Santa Barbara have been reported, all of which are unusual at this early period of the autumn, and augur an early supply of water now so sorely needed for mining purposes. For agricultural needs early rains are not indispensable, but heavy rains preparatory to plowing, a month later, will be welcome. The great want of rain now is for mining uses.

Many important quartz mines are now idle for want of water. It is estimated that a free supply of that indispensable element at this time would add near a million dollars a month to our present yield of bullion.

The nights of late in the counties to the north and contiguous to San Francisco Bay have been unusually cold, ice appearing for the first time last week in many places. Severe frosts have prevailed in some parts, which, according to the *Santa Rosa Democrat*, has damaged to some extent the corn and grape crops in Green Valley. Farmers in that neighborhood have been topping the stalks of corn, hoping by that means to hasten maturity before another visit of Frosty Jack.

On Monday October 9th, quite a heavy frost fell in the vicinity of Crow's ranch, on the Stanislaus river. The vines and leaves throughout the neighborhood were killed.

LOSS OF GRAIN AT CHICAGO.—The loss of grain at the Chicago fire was 1,600,000 bushels out of 6,600,000 bushels in store there. The fire will not interfere materially with the regular grain business of that city.

FIG 1

AS A SPADE

AS A PICK

FIG 4

FIG 5

FIG 2

FIG. 3.

the past 50 years; a fact which can mainly be attributed to the facility with which patents for inventions are granted, and the nominal fees required of inventors. In England the Patent Office is used as a means of increasing the Government revenue, while in the United States the fees and receipts of the office are only used to sustain the Patent Office Department.

The English system is unjust to inventors and damaging to the interests of that country, and we are glad to note that some of her influential citizens are beginning to see the folly of the system, and are agitating a reform. They propose to copy after the United States law. They propose to reduce the present enormous fees which

at a reasonable expense, in all of the principal countries in the world.

The present exorbitant fees in England, amount to nothing short of a prohibition to ninety-nine out of every one hundred inventors. It not only discourages home inventors, but bars out foreign inventions and improvements. The lowest fees recommended by the reformers, it is more than likely, would produce a greater revenue to the British Government, than they derive from the present oppressive taxation, even should only one-fourth of the American inventors extend their applications to that country. We believe that a much larger proportion would eventually seek patents in England.

## MECHANICAL PROGRESS.

### Two Pounds of Coal per Horse Power.

It is said, according to the *Technologist*, that a firm in London is now constructing the most economical steam engines in the world. This firm guarantees a consumption of less than two pounds of coal per horse-power, per hour; and claims that in some cases their improved engines have, in actual practice, brought the figure as low as one pound per hour.

To realize the importance of this fact—if it is a fact—it should be borne in mind that ordinary steam engines generally require about 10 pounds of coal per horse-power per hour, when the boiler admits of the evaporation of only six pounds of water for each pound of coal consumed.

Cornish boilers, which are generally considered the most economical in use, ordinarily consume about six pounds of coal per hour, per horse-power; although in extraordinary cases they have been known to reduce this amount to three, and even two and one-half pounds. With the best coal, and careful firing they usually evaporate about 12 pounds of water for each pound of coal consumed; while the theoretic value of a pound of coal calls for the evaporation of only 14 pounds of water.

The great secret of the economy of the Cornish boiler is its proportionately large dimensions, with extensive heating surface; well arranged grate and furnace; heating of the feed-water by the escaping steam; high pressure in connection with proper cut-off arrangements; careful protection against radiation, and intelligent and faithful engineers and firemen. So much is often lost by injudicious firing, that a moderately good boiler and engine loses all claim to anything like reasonable economy.

**DURABILITY OF STEEL RAILS.**—On the London and Northwestern railway in England, there is, near London, a narrow throat in the line, from which converges the whole system of rails employed in the London termini of this great railway. Here all passengers, goods and coal traffic have to pass; here too, the making up of trains and shifting of carriages is continually going on. Mr. Henry Bessemer says: At this particular spot two steel rails were fixed on May 2d, 1862, on one side of this line, and two new iron rails were on the same day placed precisely opposite to them, so that no engine or carriage could pass over the iron rails without passing over the steel ones also. When the iron rails became too much worn to be any longer safe for the passage of trains they were turned the other way upwards, and when the second side of the iron rail was worn as far as the safety of the traffic would allow, the worn out rail was replaced by a new iron one—the same process being repeated as often as was found necessary. Thus we find, at the date of the last report, March 1st, 1865, that 7 rails had been entirely worn out on both faces. Since then another rail has been worn out up to July. The endurance, under this severe test, of steel rails, over iron was as one to 16. The testimony is conclusive and irrefutable. This crucial experiment is cited by various writers, and is well known. When finally the steel rails were removed, they were found to be worn down to a thin blade, but preserved their form and tenacity uncrushed to the last!

**A PRACTICAL ENGINEER'S EXPERIENCE WITH STEAM.**—The following incident communicated to the *Scientific American*, by S. J. Dieter, of Saginaw City, should be read and kept in mind by every engineer. It furnishes the fullest proof of the rapid production of steam in a boiler, where the pressure is suddenly removed in starting, after the engine has been for some minutes at rest:—

I am an engineer of some experience, and I find if my boilers are tight, and I shut down my engine for a short time, no water going into the boilers, so that everything is at rest in the boilers, when I start my engine, the steam will invariably rise

in the boilers, so as to show more pressure on the pressure gauge.

I remember well on one occasion, when I was engineer on the tugboat H. P. Clinton, on the Saginaw river in 1862, we were laying out on Saginaw bay, waiting for some vessels we were expecting; my boiler was very tight, and I had pumped it up to the fourth try cock; we lay about twenty-five minutes with sixty pounds steam, when we sighted two vessels, and we started, and the engine did not make more than ten or twelve turns before the steam showed eighty pounds on the gauge; and I dropped the damper, and we did not get 100 rods when the steam had got to ninety pounds, and the safety valve blowing off vigorously.

My remedy is, when I stop my engines, to always have feed water entering the boilers, or the steam blowing off slightly. If you think this worth notice, it may save some valuable lives.

**IRON SHUTTERS.**—The Insurance Monitor questions the wisdom of iron shutters on the fronts of buildings, where the nearest exposure is across a street of fair width. The journal thinks that uncovered windows, with the police continually patrolling, would be a better security against fire than iron shutters, as the police or firemen could then have easy and prompt access to extinguish the same. Of course it is desirable to have iron shutters and doors to close all openings where exposures endangers a building, but we could name instances, not a few, where iron shutters and doors have proved the destruction of a building instead of its salvation. The above suggestions are of especial interest in view of the difficulties encountered at the late fire, which resulted in the destruction of the Harpending block, in this city.

### Pneumatic Bells.

Efforts have been made to supersede by electricity the use of the wire connection with the common door bells. Electrical bells have been introduced into large buildings with some success. With this description of bell no movable wire is necessary, and the cranks are done away with. Such arrangements also facilitate the use of the indicator to show from which room the sound comes, but the objection to all such electrical apparatus has been that they require a battery which requires attention. The common bell has therefore been found superior in private houses, although the electrical bell has many advantages for public buildings.

A German invention, lately introduced into England, provides a pneumatic bell which has many advantages over the common style, and is both simple and ingenious. A leaden pipe, about as thick as a lead pencil, is used in place of wire; to one end of this pipe a piece of ornamental rubber tubing is attached, and at the end of this an india rubber ball. When the ball is compressed by the hand an air wave is sent through the tubing to the bell. At the bell end, this pipe terminates in small spear-shaped bellows of rubber, from which rises a rack which engages a toothed wheel, which moves a hammer and thus rings the bell.

Large pneumatic bells constructed on this principle, have been applied to three of the largest vessels in the French navy, in communication from the engine room to the deck. They have also been introduced into some French merchant steamers and English men-of-war. The common bell wire stretches and the cranks get out of order, the electrical bell is complex and requires attention, but the pneumatic bell would seem to obviate these difficulties.

A modification of this invention is highly useful for offices, dwellings, etc., and consists of an arrangement for opening a door by a person sitting at a distance from it or in another room. The gentle pressure of the air in a pipe is made to release a detent, which forces a spring and the door springs open.

**PAPER FROM HOP VINES.**—In the region of Marseilles, France, a beautiful white paper is made from hop vines, and its strength in connection with its pliable texture, renders it a favorite with those who have tested its merits by actual use. The hop vine is well known as a very strong, pliable fibre, and there is no question but that it would make an excellent paper. Its scarcity, however, will not allow of its extensive use for such a purpose.

## SCIENTIFIC PROGRESS.

### Agassiz Coming to San Francisco—Scientific Researches.

Prof. Agassiz is about setting out from Boston on a deep sea exploration. His observations will be made between the Atlantic Coast and the deep ocean to the eastward. To accomplish this he will proceed on board a U. S. coast survey steamer, in a zig-zag course, as far as Cape Horn. He carries dredging apparatus capable of working at a depth of about 3½ miles. After doubling Cape Horn he will proceed up the western coast of the continent in the same manner as far as this port, dredging and sounding all the way. His observations will undoubtedly add much to our present knowledge of the ocean's bottom, and of the conditions of animal life at great depths beneath the ocean's surface.

In so long a trip, through such varied climates, and during calls at the many ports at which a steamer must necessarily stop, on such a voyage, the Professor, with his natural habit of observation, cannot fail to collect much information, aside from the specific object of his mission. The arrival of this distinguished scientist in San Francisco, will be an event of no ordinary importance, the more especially as he will come freighted with so much that will be new and interesting in the line of progressive science.

**TREMULO FOR REED ORGANS.**—A patent was recently issued at Washington for the application of a rotary prism to organs or melodeons in such way that the sound waves can strike it at different angles, to be reflected in different directions, and thus produce the desired tremulous effect. If preferred, a quadrangular or rhombic prism may be used. It is made of thin wood or other light material, preferably hollow. It is connected with the shaft of the wind wheel, which, when revolved, will impart rotary motion to the prism. The wind wheel is arranged and moved in the ordinary or other suitable manner. When the sound waves strike the revolving prism at different angles, they are reflected with greater or less force, according to the difference of angles, on the same principle as waves of light are reflected, and thus produce the desired tremulous effect. The prism is to be placed in a position where the sound waves can strike it directly after they leave the reeds.

**A NEW TEST PAPER.**—Professor Böttger, announces the discovery of a new re-agent, which, he asserts, is highly sensitive to the alkalies. It is a coloring extract of the *coleus verschoffelti*, and is produced by digestion, for 24 hours, in pure alcohol, to which a few drops of sulphuric acid have been added. The hue is a brilliant red, which turns green on contact with any alkali. It is not affected by carbonic acid, and will detect the slightest trace of ammonia in illuminating gas, if moistened and placed against an open jet. The presence of the minutest quantity of a carbonate of any of the alkalies is detected by it.

**THE NEBULAR HYPOTHESIS** has received new confirmation from the discoveries made by the spectroscope. Prof. Kirkwood states, in the *American Journal of Science* "that it has demonstrated the present existence of immense nebulous masses such as that from which Laplace supposed the solar system to have been derived." It has shown, moreover, a progressive change in their physical structure, in accordance with the views of the same astronomer. In short, the evidence afforded by spectrum analysis in favor of the nebular hypothesis is cumulative; and of itself sufficient to give this celebrated theory a high degree of probability.

**EFFECT OF CASTOR OIL ON LIGHT.**—O. Popp has observed that castor oil turns polarized light to the right, and differs in this respect from all other fats. He also found all the commercial castor oil to contain nitrogen, and finds in these facts supports of his previously expressed opinion, that the purgative properties of this oil are due to a nitrogenated body, probably an alkaloid.—*Archiv d. Pharm.*

### A New Source of Electricity.

James St. Clair, communicates to the *London Chemical News* the fact that he has recently discovered a new source of electricity. He relates that in the course of some experiments relative to sulphur and phosphorus, his attention was drawn to their mutual action while in alkaline solutions, and it occurred to him that probably from this there might be derived an electric current.

In order to ascertain this, as well as to determine—should there prove to be such—whether it was constant or not, there was prepared a cell containing a solution of caustic potash in which phosphorus and sulphur, both in sticks, were placed. Within half an hour the phosphorus was reduced to an oily mass perfectly mobile, occupying the lower part of the cell; the sulphur was not at first affected. The temperature at first rose considerably—about 20°—but this soon passed off, and the solution returned to the temperature of the surrounding medium, varying from 56° to 60° F. During the first six days there was a constant development in small quantity of phosphuretted hydrogen in the spontaneously inflammable form, but after that time, although phosphuretted hydrogen still continued to be evolved, it no longer ignited spontaneously, this being probably due to the simultaneous development of sulphuretted hydrogen, which began to be exhaled in appreciable quantity about this time. At first the sulphur was little affected, but at the end of ten days it was found that at the point of junction of the phosphorus therewith there had occurred considerable loss of substance.

In the solution there were produced sulphite and phosphite, hyposulphite and hypophosphite, and slight traces of sulphate and phosphate of potassium. At the end of three months the conditions were still much the same.

Subsequent experiments showed that the electro-motive force, as registered by the electrometer, was as 162 to 120, when compared with a Daniell's battery—showing a difference in favor of the sulphur and phosphorus of 42°. Mr. St. Clair is engaged in further observations on this subject, the result of which will be made known at a future time.

**TO MAKE A MALARIOUS DISTRICT HEALTHFUL—FLOWERS AS A DISINFECTANT.**—Prof. Mantegazza has discovered that ozone is developed by certain odorous flowers. A writer in *Nature* states that most of the strong-smelling vegetable essences, such as mint, cloves, lavender, lemon, cherry and laurel, develop a very large quantity of ozone when in contact with atmospheric oxygen in light. Flowers destitute of perfume do not develop it, and generally the amount of ozone seems to be in proportion to the strength of the perfume emanated. Professor Mantegazza recommends that in marshy districts and in places infested with noxious exhalations, strong-smelling flowers should be planted around the houses, in order that the ozone emitted from them may exert its powerful oxidizing influence. So pleasant a plan for making a malarious district salubrious, only requires to be known to be put in practice.

**NEUTRAL SOLUBLE GLASS AS A WASHING MATERIAL FOR WOOLEN GOODS.** is said to be the best substance that can be applied to that purpose. One part of the soluble glass is added to 40 parts of water at 45° R. In this solution the wool is immersed and worked about for a short time with the hand, and then rinsed in cold water. The results are said to be surprising, the wool emerging clean, white, soft and without odor.

**VEGETABLE CARBOLIC ACID.**—It is said that a plant called *Andromeda Leschenaultii*, growing in the Neilgherry hills, in India, has been found to yield carboic acid. Mr. Broughton, the Government medical officer for the district, reports that it is far superior in purity to the ordinary product of coal tar, being less deliquescent and free from any admixture of noxious concomitants. As its cost is far above that of the mineral product, and as the latter can be chemically purified, the discovery has no economical or commercial value; but it is interesting as a botanical and chemical fact.

**FOSSILIFEROUS GRANITE.**—M. Reinsch, inspector of mines at Gotha, states that he has recognized organic remains, both animal and vegetable, in certain granite rocks heretofore reputed to be of igneous or eruptive origin.

## CORRESPONDENCE.

### THE WESTERN SLOPE OF WHITE PINE MOUNTAINS.

BY OUR OWN TRAVELER.

Eds. Press:—Thinking that your readers would like to hear of what is being done on the western slope of the White Pine Mountains, I left Shermantown one morning to make a flying trip to the district, which is being prospected with vigor by the miners. The first visit I paid was to

#### The Bushnell Mins.

about three miles from the Monte Cristo Mill, which was located May 6th, 1869, by Jos. Fulton. The elevation is about 10,000 feet. A cut has been run into the hill about 15 feet long, and 8 feet wide. About 50 tons of ore are on the dump, which will pay about \$75 per ton. The ore will have to be roasted to secure a good return; it contains chloride of silver and galena. The formation is hard limestone. Considerable money has been spent in making the trail up to this mine, which will be more fully prospected when the ore can be treated at the mill.

#### The Parker Ledge.

owned by Jos. Fulton, was located August 2d, 1869—1,000 feet. The shaft is 12 feet deep. The lode dips to the east, and crops out along the hillside. It is about 6 feet wide at the bottom of the shaft. There are about 25 tons of ore on the dump, assaying \$100 per ton. This mine can be very easily worked.

#### The Mountain Lion.

a short distance from the Parker, is a lode 2½ feet wide, running into the hill. It can be traced some distance on the surface. A tunnel 33 feet long, has been run, showing up a good quality of smelting ore. It is owned by Johnson & Co., of Oakland.

#### Trench Mins.

owned by Jos. Trench, of San Francisco, is 2½ miles south of the Monte Cristo mill. T. Robinson is superintendent, and V. Bentsch, foreman. It was located in December, 1868, by Capt. Lane. The main tunnel is in 128 feet, connecting with a shaft 48 feet deep, so as to give air to the mine. There are 35 tons of ore on the dump, waiting for shipment. It requires roasting, and yields largely. The average width of the lode is 3½ feet, growing sometimes small and then widening out into large chambers. Eight men are employed at present.

#### The Caroline.

on Mt. Ophir is a fine vein of rich ore, and pulp assays run as high as \$800 per ton. A tunnel has been run in on the vein 90 feet. The ore will be worked at the new mill on this side. There are 14 men at work on the mine, which is owned by L. Ellis.

#### The Lone and Mt. Ophir Mines.

are located a little south of the Trench. The shafts sunk on both mines show a good quality of ore, and assays run all the way from \$50 to \$700 per ton. Jos. Fulton and others are the owners.

#### The Monte Cristo Mill.

about 15 miles from Hamilton, on the western slope, was built within the past year, and has 20 stamps, double cams. There is in connection with this mill a Stetefeldt furnace, which was built in 1870, and after being tested, the old five-stamp mill was pulled down, and this fine new one took its place. There is an 80-horse power engine—16-foot fly-wheels, and two fine large tubular boilers 16 feet long, each containing 54 tubes. The boilers were manufactured at Newburgh, N. Y. The battery is from the foundry of Booth & Co., San Francisco. There is a screw or conveyor on each side of the battery, to take the pulp on to, and to the top of, the furnace, which is 25 feet high. The stamps weigh 800 pounds each, and dropping 90 times per minute, crush 30 tons in 24 hours. They use one of the Wagner's Patent Crushers, made at Derby, Conn. There are also four of Booth's Patent Pans—wooden sides; two fountain pans; three settlers, and two agitators. The pans were all made in San Francisco. There are three stacks, the main one being 60 feet

high. The Stetefeldt furnace is of the largest size, and cost over \$20,000. Steam jets and all the late improvements are used. The battery blocks and timber came from Truckee, Cal. The roof of the mill is covered with tin, to prevent accidents from fire; an idea which might be carried out advantageously by other mill owners. A stone retort-room, 16x20 feet, is a short distance below the mill. This company has the finest water privilege on this side of the mountains. Mr. H. N. Day, of New Haven, Conn., is president; Wm. Robinson, superintendent; Thos. McMasters, amalgamator. There is a very fine garden near the mill, where they raise vegetables for the mill hands.

A large number of mines are located on this side of the mountains. The old five-stamp mill was built in 1866, and when the excitement broke out in this country it crushed the first rock that was ever milled in the District—ore from the Hidden Treasure mine. Among the mines that furnish this mill with ore are the Trench, Parker, Bushnell, Bald Eagle, Philadelphia, Gloucester, (owned by Woodruff & Ennor), Enterprise, Zavalla, Vanderhilt Nos. 1 and 2, and Uncle Sam. A few of the mines in the cañon, now being worked energetically, are the Morrill & Leathers, Crown Point, and Mammoth, with a number of others that will yield large quantities of ore. A shaft 45 feet deep has been sunk in

#### The Enterprise.

The lode is from three to six feet wide, and the ore averages \$50 in silver, and 48 per cent. of lead. Another good location is

#### The Zavalla.

the ore of which assays from \$50 to \$130 per ton. It is stetefeldtite, argentiferous galena and oxide of lead. The Queen City has a large quantity of ore on hand ready for milling. The ore in

#### The Murray No. 2.

consists of argentiferous galena and chloride of lead. It is of a good quality, averaging \$30 to \$150 per ton; but requires roasting. The mine looks very well, and a large cut has been made, showing a good vein of ore.

#### The Morrill & Leathers.

has a shaft sunk 10 feet deep, showing ledge matter 5½ feet wide. It runs parallel with the Murray No. 2, and the rock is the same description.

#### The Bald Eagle.

has about 100 tons of ore on the dump. A shaft 40 feet deep has been sunk, showing a ledge 3½ feet wide. The Philadelphia is located east of the Bald Eagle.

#### The Badger Stats

shows a large quantity of good roasting ore in sight.

#### The Gloucester.

belonging to Woodruff & Ennor, has about 40 tons of ore on the dump, which will work between \$50 and \$100 per ton. The ledge is six feet wide and the shaft 12 feet deep. This is a good mine and well worth a visit. It is located about 1½ miles northeast of the Monte Cristo mill. J. H. Halderson is superintendent.

#### The Tucson City Lode.

is about 3 feet wide, and the shaft is 32 feet deep. The Enterprise No. 2, Murray No. 2, and Zavalla, are owned by A. J. Brown. They are all good locations that show rich ore. Plenty of fine timber abounds on this side of the mountains. W. H. M.

### THE SAN DIMAS MINING DISTRICT.

Eds. Press.—The district of San Dimas is situated in the State of Durango, about 2½ miles from the dividing line of Sinaloa, and on a tributary of the Piastla River, some 10 miles from its junction with that river. The town contains a fine church, two large haciendas de beneficio (mills for reducing silver ores, so to speak), some 10 to 12 stores of a very respectable size and stock of goods, and about 1,200 to 1,500 people, in and around it. It is the political and legal center; also, having the jefe (chief) judges, and records. The other numerous districts within a radius of 20 miles or so are to a great extent dependent upon it. They are (the principal ones) to the north Huahuapa (wha-whap-par) to the south and southeast Guariemey (whar-is-semey), Tayoltita, and LaPnera, and to the west San Vicente,—five in all. There are others, at a greater distance, but not tributaries of this, as Gavilanes (a center in itself), Ventanas, Buena Vista, and Candelaro, while there are more which contain

mines, but are not well known yet. It is, however, of San Dimas, and its five satellites that we propose to speak.

#### The Principal Mines of San Dimas.

are Nuestra Señora de Candelaria (said to be the seventh best mine in the Republic,) Bolaños, Cinco Señores, Santa Veneranda, Arana, San Luis, Carmen, Dolores, Remedios, San Dimas, San Juan Nepomocino, and some others which are less known. Those of the above which are working in force are the Bolaños, and San Luis. They are two claims on the same vein. The vein is nearly vertical in basaltic porphyritic trap rock. It is worked down on one chimney of ore nearly 500 feet deep, 385 feet in length on the vein, (horizontal projection), and an average width of 10 feet. The chimney pitches to the north at about 58°. The ore is silver sulphide imbedded in white quartz with iron in different forms now and then, as pyrites, and the black oxide of manganese, and occasionally copper pyrites. Gold is visible to the eye at every blast, and the bullion is from .050 to .150 fine. A new tunnel is being driven to cut the vein at 730 feet, which will be only 200 feet long. It is an utter impossibility to state what any mine, in this vicinity has produced, as there are no records to show the truth. But my opinion is that this mine has produced over \$1,000,000, averaging \$140 per ton. It is only well prospected however, and with vigorous, and well directed blows will produce much more. Mill facilities only are needed to make it a very valuable mine.

San Luis is further to the north, and has produced about \$2,000,000. The several other claims of this lode have produced, but nothing positive can be stated as to the amounts.

Cinco Señores has a greater reputation than any mine here. But as it is flooded, and we can only speak of what we see and feel, we must defer an opinion until work has solved the question.

#### The Candelaria.

This justly famous mine is said to have been discovered in 1783. In 1820 the Revolution or War of Independence, drove away the owner and the mine "flooded." I am, however, justified in repeating, and believing, that \$56,000,000 have been extracted from it. The "strike" was taken from (chiefly) a chimney of ore now worked 943 feet deep, 200 feet long, 15 feet wide—283,000 tons at \$200 per ton, equalling \$56,600,000. Now the government records show that he paid \$11,000,000, as the King's one-fifth of \$55,000,000, so that the two statements are approximately correct. Some say as high as \$80,000,000. An American Co. own and are working Candelaria, Dolores, Remedios, and Cheneri; Cinco Señores, Veneranda, Arana and San Rafael; also Guzman, Trinidad, Bolaños and Carman, or more properly speaking, there are only three mines, Bolaños, Cinco Señores and Candelaria.

Mexican companies work the remainder. The American company is driving three large tunnels (one for each mine), which will drain them to the bottom. They have been engaged for seven years in this work, and the end is not yet. At the same time they are extracting ore from the levels above water.

As all are so familiar with the rude Mexican methods of reducing silver ores, we will not harrow the souls of our readers with a repetition of their "brutal application of brute force."

Water power is abundant, and fuel costs from \$5 to 5½ per cord. The roads are merely trails up brooks and over steep mountains. Wagons cannot be used at all. The guarantees of public safety are very limited indeed, and one must be well armed and ready to repel robbers at any time. Revolutions are now become chronic, so that one is in about as insecure position as he could desire.

This is due to the Indian blood. They make a play and a farce of Government. Indeed a structure built upon such a foundation as Mexico is, where both sexes have no confidence in the other, none in religion, or the sanctity of home, and are led around by a conniving clergy, well up in the vices, such a structure cannot stand the first heavy rain. The only hope for Mexico is in the railroad, of which the telegraph, now in operation in the Republic, is the sure fore-runner. The barometer of a country is the condition of its women.

VALVERDE.

San Dimas, Durango, Aug. 18, 1871.  
(To be continued.)

### Bull Run District, Nevada.

Eds. Press:—Since I wrote you last, several mines in this district have been bonded at good figures and others have been mortgaged to raise money, to prepare for work this winter. The principal mines are looking well and those being worked are improving as the depth is increased.

#### The Tiger Mine

is looking better than ever, and a large quantity of \$500 ore is being taken from the main shaft.

#### The Blue Jacket

is in a fine condition for the extraction of ore. The tunnel is 200 feet long, 130 feet of which is in ledge matter. The pay streak is about 22 feet wide. This is probably one of the richest mines in Northern Nevada.

#### The Johnson Ledge

is looking well, and there is plenty of gold in sight. The North Star has fine prospects ahead as have several other companies. The great difficulty with us is the necessity for the transportation of ore to Mountain City for reduction. I understand that the arastra, built by Mr. Berett, is nearly complete, and will soon be put in operation.

#### Placer Diggings

have been found on the east side of the mountain in what is known as the Bull Run Basin. Three or four men have been prospecting there all this summer, and one of them, Mr. Judd, tells me that they are now taking out from \$4 to \$6 per day to the land; but lack of water retards their operations. The gold is coarse and heavy, and the bed rock deep. The miners intend putting in a ditch next summer, so as to use hydraulics, by which means they expect to realize an ounce a day. One piece of gold was found weighing \$13, and another \$7. Several have been found valued from \$1 to \$5 each. It is thought that extensive diggings may yet be found in this vicinity, as scarcely a pan of dirt can be washed without finding from one to twenty ceters.

CHLORIDE.

Bull Run, Oct. 9th, 1871.

How THE HUMBAG PAYS.—A certain Rev. advertises to send free, out of pure kindness, a valuable receipt for the cure of consumption to all who forward to his address a postage stamp. This looks fair, but the readers of a thousand journals wonder how he can afford to pay, year after year, for so many advertisements. The mystery is unravelled when a cunning circular is returned with the receipt, saying the only safety in procuring the wonderful South American remedy is by sending \$3.50 to the "grateful" scoundrel "snatched from the borders of the grave" who employs the title of Rev. to steal more successfully from "gnats" who are silly enough to notice advertisements that promise to give "something for nothing." This is our answer to those who wish to make our advertising columns accessory to their despicable schemes.

CIDER MAKING.—Quite a large number of residents of Nevada are engaged in cider making this season. As yet we have never seen any California cider that will keep any length of time, and from the amount of cider manufactured this season we infer that vinegar will be very abundant in this locality in the future. Many experiments have been made to keep cider for winter use, as is done in the East. In one case an experienced cider manufacturer sent to England and procured a cider mill of the same kind as was used by his father who manufactured cider for London. He set his mill in operation, put his apples through the same process, and produced a beverage, but it wasn't cider. A gentleman who tried it, said whisky was mild compared with that cider. California cider is excellent when new, but it won't keep. We have never known of an instance where it could be used after a month or two. Any one who can find a process by which cider can be kept for a year as in the East, will render an important service to those engaged in its manufacture.—Nevada Transcript.

SALMON, from the Sacramento river, are now being shipped East in large numbers, where the luxury is appreciated. Californians scarcely know the value of such common delicacies.

# MINING SUMMARY.

THE following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

ORE.—Alpine Chronicle, Oct. 7th: Another body of good ore has been struck in the Schenectady.

MONITOR MINER, Oct. 7th: Fine ore from the Exchequer mine was shown us this week with assurance that there was now a large deposit in sight, sufficient to justify the management in starting up the mill soon.

THE ore house of the Monitor & N. W. Co. is being improved. It will have self-discharging and loading facilities, which will reduce the cost of hauling ore to the mill.

THE Old Billy Rodgers mine in Hope Valley is working again with quite a large force.

LOOMING UP.—The Schenectady quartz mill at the lower end of Main street is fast approaching completion.

### BUTTE COUNTY.

THE SPRING VALLEY MINING DITCH.—Chico Enterprise, Oct. 14th: The Co. of Cherokee Flat have sold to an English Co. their mines and ditch property for \$1,200,000.

OROVILLE Record, Oct. 14th: Rich gold bearing quartz has been struck near Little Kimschw. Also a silver ledge of superior richness.

### CALAVERAS COUNTY.

WHAT CHEER.—Mok. Hill Chronicle, 14th: The dump, sluice-hoxes, etc., necessary for the commencement of operations are completed. Everything is in readiness for taking out gravel—"pay dirt," at that—as soon as water can be had.

GWYN MINE.—The main shaft has reached the depth of 520 feet. Work will be commenced upon the 500-foot level as soon as the "sump" is sunk 10 feet deeper. The lead is looking first-rate in the bottom of the shaft—better than at any other point. Only 26 stamps are running at present on account of the scarcity of water. When the whole battery is put in motion the mine will pay \$1,000 per day.

PETTICOAT.—Rapid progress is being made in sinking the shaft. The lead is very much broken up, the space between the walls being filled with slate "gouge" and detached pieces of quartz. The shaft is to be put down 300 feet.

### CONTRA COSTA COUNTY.

THE MARSH GRANT COAL MINE.—Contra Costa Gazette, Oct. 14th: A vein of superior coal, 7 feet thick has been struck in the Brentwood mine and the work of constructing a railroad from the mine to the river will be shortly commenced.

### EL DORADO COUNTY.

SPECIMENS.—Calaveras Chronicle, Oct. 14th: Some beautiful specimens of gold-bearing quartz from the mine of Johnson & Co. at Greenwood are on exhibition here. A houlder weighing 100 lbs yielded 300 oz. of gold.

### LOS ANGELES COUNTY.

BULLION.—Los Angeles News, Oct. 5th: 586 bars, weighing 48,485 lbs were received from the Union works, Cerro Gordo, on the 29th Sept. On the 30th, 311 bars from the O. L. S. L. Co.'s works weighing 27,044 lbs were received. On Oct. 3rd 244 bars, 20,257 lbs, were received from the Union works; and on the 4th, 48 bars, weighing 3,954 lbs, were received from same works.

### MARIPOSA COUNTY.

MINING JOTS.—Mariposa Gazette, Oct. 13th: The proprietors of the Ferguson mine and mill will soon add 10 additional stamps to their mill which will make it a 25 stamper. The quartz now being taken out looks fine.... Hambleton of Buckeye, has been taking out some very rich rock. It is of the honeycomb appearance and well sprinkled with gold. A pile of quartz at Hite's mill, was variously estimated to contain from \$50,000 to \$100,000 in gold. About all the water-wheel mills and several of the steam ones in this county are now lying idle for want of water.

### NEVADA COUNTY.

MANHATTAN MINE.—Nevada Gazette, Oct. 9th: In course of 10 days, the Co. will be at work again.

TOWN TALK MINE.—G. V. Union, Oct. 10th: Made a clean up last Saturday, after a month's run with a 5 stamp mill. It gave 279 3/4 oz. of retorted gold, worth \$5,000.

DESTRUCTIVE FIRE AT CANON CREEK.—The great dam belonging to the N. Bloomfield Gravel M. Co. was destroyed by fire yesterday. About three miles of the flume,

hslow the dam, were hurned. A quartz mill located below the dam, was also burned. The fire was accidental.

### PLACER COUNTY.

A GRAVEL MINE.—Auburn Herald, Oct. 14th: E. West is opening a gravel mine of much promise above the Junction House and near the head waters of Rock Creek, some 2 or 3 miles from here. He has run a tunnel into a ridge some 300 ft. in all, and struck an old gravel bed that contains heavy washed gold in paying quantities. Two weeks ago, the drifting of one man in 5 days had yielded about \$100, or \$20 per day, and the paying strata was increasing in depth and width as the work advanced.

### PLUMAS COUNTY.

MOHAWK VALLEY.—Quincy National, Oct. 7th: At the mouth of Jamison Creek several new claims have recently been opened, and the owners appear to be well satisfied with their prospects.

The Eureka Co. have put up a new battery in their steam-mill, and 24 stamps are at work on rock that yields rich returns.

Jackson & Graham at Hardscrabble, cleaned up \$700 last week and expect \$500 more this week.

Mr. Betterton thinks he has discovered a quartz lode that will pay to work. He pounded out \$12.50 with a mortar some days ago.

CHEROKEE.—J. D. Compton's new quartz mill will be in running order within 3 weeks. The main shaft on the ledge is down 160 ft. The ledge averages 4 ft. in width and is good paying rock. H. Gregg, is taking out rock from his mine averaging about \$10 per ton. Mr. G. also has a contract to sink a shaft on the Eureka ledge. If at the depth of 60 ft. the ledge proves to be as good as it is near the surface, the Co. intend to erect a mill. The Co. will work in their upper levels during the winter. Bachelder has run a new tunnel which taps his ledge (the Green Mt.) about 200 ft. below the present working.

SOLD AGAIN.—The property of the Indian Valley Co. has been sold to Applegarth Bros. who intend working it.

### SAN DIEGO COUNTY.

ITEMS.—San Diego Union, Oct. 14th: All the mills except the McMechan, which has stopped temporarily for repairs, are very busy. The mills of Gunn, Reynolds & Co. and DeFrees & Co. are both engaged upon Helvetia ore. Returns from the S. F. Mint show that the mill of Gunn, Reynolds & Co. beat that of DeFrees & Co. on the last crushing of this ore 40 cents per ton.

Mr. Miller, foreman of the Helvetia Co., fell down a shaft 70 ft. deep, on the 29th of Sept. and fractured his skull badly. The wounds he received, will not prove fatal.

The prop's of the Owens lead are hard at work excavating, and expect to strike good paying rock.

### SISKIYOU COUNTY.

QUARTZ MILL.—Yreka Union, Oct. 14th: Elders & Co., of Providence Hill, have their mill in operation. They have taken from their ledge since June, by means of an arastra, about \$7,000. Another quartz mill is being built in the vicinity.

### TUOLUMNE COUNTY.

CITY LOT MINING.—Sonora Democrat, Oct. 14th: Some days since parties commenced prospecting the vacant lot on the corner of Washington and Jackson streets. The prospectors have found good paying dirt; they hauled a quantity and washed it, from which was realized about \$6 per cart load.

## Nevada.

### EUREKA DISTRICT.

STARTED.—Eureka Sentinel, Oct. 12th: Work has been resumed on several old locations on Adams Hill.

GOOD PROSPECT.—An assay of ore from a newly discovered mine near the head of N. W. Cañon, returned \$139.20 in gold, and \$217.08 in silver.

COAL.—J. D. Sullivan is running a tunnel into Pancake Mt. for coal. In a shaft sunk some time ago he found a good prospect, at a depth of 50 ft.

SALE.—The Tip Top mine has been sold for a large figure. The purchasers intend commencing work at an early day.

ANOTHER SALE.—W. H. Davenport has purchased an interest in the "Gray Eagle," "Red Warrior," and "Mary Blane," situated in Jackson Cañon, the average assay of the ore from which is \$100 per ton.

STRIKE ON RUBY HILL.—The new vein recently cut in the tunnel of the Eureka Cons. Co., proves to be one of the finest hodies in the Dist. In the side tunnel the ore is over 10 ft thick, and in the end toward the centre of the hill, some 350 ft. from the ravine, a cross cut in vein matter

shows the width to be 12 ft. and not yet through. The whole face at this latter point is in ore which will assay \$200 in silver for each ton, no gold, and an average of 40 per cent.

STRIKE.—Judge Gray has made a lucky strike about 800 ft. from the Gen. Lee mine, and named it the '49.

GOODWIN'S CANON.—Parties prospecting, inform us that the locations are turning out splendidly. The Garvey and others, after a few days' work, showed some horn and native silver, assaying into the thousands.

ACCIDENT.—A miner named Jackson, employed in the Buckeye was yesterday severely injured by a falling houlder, which struck him on the head, lacerating the scalp several inches.

EUREKA.—Cor. Reese River Reveille, Oct. 13th: The English Co., which lately bought the Richmond Co.'s mine and furnace works for \$250,000, have commenced laying the foundation for two "Leviathan smelters," the capacity of which, will be 15 tons of hulsion per day. The Co. intend to have them in working order inside of 60 days. Another heavy mining sale is on the tapis, consisting of the Raline, Belmont, and Peoria mines. A rich strike was made yesterday in the Jenksville mine, up N. Y. Cañon near the Dunderberg lode. The ore is of the smelting style and assays upwards of \$200 per ton. At a depth of a few feet the defined ledge is 2 1/2 ft. wide containing 60 per cent. lead. Negotiations are pending for the sale of the Bullwhacker, Dunderburg, El Dorado, Valentine, Lord Byron and Tecoma mines to an English Co. The Phenix furnace is turning out regularly 3 1/2 tons of high grade bullion per day. The Richmond is clearing \$1,000 daily, and the Eureka Cons. steadily run 450 to 500 tons per month of bullion that will average \$325 per ton.

### ELY DISTRICT.

BULLION SHIPPED.—Ely Record, Oct. 7th: W. F. & Co. shipped, since Oct. 5th, (one day's shipment) 27 bars, valued at \$38,228.92, and (same paper Oct. 12th,) since Oct. 8th, 36 bars, valued at \$70,232.96.

CRESCENT MILL.—The mill having completed its contracts for working up small lots of ore, has stopped temporarily. It is believed that the Alameda Co. is about purchasing the property. The Crescent will not start up again until a full supply of water is secured.

### HUMBOLDT.

BULLION SHIPMENT.—Unionville Silver State, Oct. 14th: Amount shipped from the Arizona mine, since our last issue, was \$5,600.

LOOKING WELL.—The Alpha mine, near Rye Patch, is showing a well defined vein of rich ore.

WHEELER SHAFT.—The shaft, being sunk for the purpose of cutting the Arizona ledge, is down over 100 ft. Indications are favorable.

WILL REBUILD.—Smith & Harley will rebuild the Rye Patch mill, on the site of the one destroyed by fire a few weeks ago. The new mill will be larger than the old one, and will be ready for business by the first of Jan.

SOLD.—G. Carmany has sold his interest in the Butte mine, near Rye Patch.

THE Butte M. Co. expects to have their new mill in operation before the first of Jan. It will have a capacity for 20 stamps.

### REESSE RIVER.

BULLION.—Austin Reveille, Oct. 13th: Manhattan Co. shipped bullion valued at \$11,999.68 last month.

J. A. Paxton & Co. shipped, during the same time, 47 bars, weighing 3,336 lbs., valued at \$25,101.69, of which \$23,129.11 was from—the Transylvania and Arizona at Belmont—and the balance, \$1,972.58, from Montezuma dist. W. F. & Co. shipped during the same month 60 bars, weighing 4,050 lbs, valued at \$33,047.93, nearly all from Belmont.

ISABELLA.—The Manhattan Co. have 5 different parts leased to as many parties, most of whom are taking out ore. The Co. have also let a contract for drifting into the hill on which good progress is being made.

SARATOGA.—Curtis, Story, Roberts and Tucker have had 33 tons of second class ore worked and it returned coin at the rate of \$199.50 cents per ton. They have 13 tons on hand of high grade that will work close to \$1,000 per ton. They are still taking out ore and sinking the incline. A part of the mine is leased to chloriders, who are getting some fair ore.

SAM BRANNAN.—The owners have erected a whim and placed things in good shape. They are down 200 feet and struck the ledge day before yesterday. It looks well though not fairly opened. The last lot of ore from this mine worked \$600 per ton.

METACOM MILL.—This mill is being thoroughly overhauled and greatly improved. The harrels used for amalgamating, have been new lined, machinery overhauled and a new White (revolving) furnace added. This furnace is provided with 4 dust chambers 6 by 12 feet each.

THE Pacific Mining Co. intend to start the mill about the first of next month. They have on hand 200 tons of ore and will run the mill on custom ore and the rock from their own mines.

WELL SUPPLIED.—The Manhattan has been running day and night for a long time past, yet ore has accumulated until there is, at a moderate estimate 280 tons. This is mostly high grade and much of it is from the company's mine on Lander hill.

### WASHOE.

OPHIR.—Virginia Enterprise, Oct. 15th: In a few days the Ophir Co., will have completed the work of putting in all their tanks and pumps, when sinking will be resumed in their main shaft.

SAVAGE.—There is but little ore above the tenth level and not much room for development of any new hodies. They will soon commence sinking their incline for the purpose of opening a new level below. The mine yielded last week 1,018 tons, average assays are \$32.12 per ton; Hale & Norcross yielded 1,191 tons.

THE Suto tunnel was in yesterday, 2,480 feet.

AIR ENGINES.—There is a probability that compressed air engines will be introduced in our mines.

YESTERDAY the head of the steam-drum of the west set of boilers at the south hoisting works of the Yellow Jacket Co., blew out, with loud report startling the whols town. Damage slight, nobody hurt.

CROWN POINT.—Gold Hill News, Oct. 11th: The body of ore at the 1,200 foot level is found by survey to extend 70 feet further north than it did in the level above. The other ore producing levels are looking well. It is supposed that the ore body is widening to the northward. This ore yield for last week was 450 tons, of the estimated value \$10,952.89. The drift south at the 900 foot level is in 125 feet. The west winze to connect the 1,100 foot level with the 1,220 will also be completed shortly; the east winze from the 1,100 is down 35 feet. The ore body at the 1,100 foot level is 280 feet long, extending beyond the south line into the Belcher. The 1,200 foot level continues opening out splendidly, giving excellent assays. The incline from the main shaft is completed to the 1,300 foot level, and the station is being opened for a south drift and new level at that point.

BUSY.—Reno Journal, Oct 14th: The Auburn Mills and Stetefeldt furnace, for the reduction of refractory ores are very busy.

The Auburn Co. received on the 12th instant, two car loads of ore from the De Soto mine, Star City.

### WHITE PINE.

BULLION.—White Pine News, Oct 7th: W. F. & Co. shipped to-day, to London, 1 bar of hulsion weighing 73 pounds, value \$1,298.47. Also one bar from East Sheboygan, to same place, valued at \$451.35.

EAST SHEBOYGAN.—For several weeks the appearance in all the workings has gradually improved, until a vast body of ore for a distance of 200 ft. has been developed. It is the intention of the agent to start a tunnel. The original tunnel is 40 ft. east from the old tunnel, showing ore the entire distance. The ledge shows an average of 16 ft. thick. Ninety feet north is the Exchange shaft, 22 ft. deep, showing a fine body of ore. Two drifts are going ahead; one running east, in a distance of 12 ft; the other running north, to connect with the Regent shaft 100 ft. north. The Regent shaft is down 18 ft., and shows the ledge pitching east, the same as in the other workings. A drift is now being carried south (in 10 ft.) to meet the Exchange drift. This, with a drift soon to be constructed, connecting Exchange with Oriental, will open a breast of ore 60 by 190 ft. There are 65 tons of low grade ore on the dumps.

HIDDEN TREASURE.—A tunnel was started the 30th of Sept., a few feet above the O'Neil grade. When it is in under the lowest workings there will be a "slope" of 434 ft. from the bottom of the tunnel up to the lowest ore deposit yet found on the mine, and will be 538 ft. below the croppings. The work will be pushed day and night.

SOUTH AURORA.—Shaft going down in Trewella drift. Shaft going down in Sheridan drift. Tunnel in 150 ft. and going ahead at a rapid rate. The last contract was for 100 ft.

WARD BEECHER.—The immense cavity

opened by the blast last week shows several thousands tons of rock in sight. All the available force of the Ward Beecher men are engaged digging a ditch from the hoisting engine to the water tank, to protect the pipes from freezing during the winter.

**GLAZIER.**—Working as usual from the Slanson shaft, to connect with the Osborn shaft. Running in fair ore.

**GREAT WESTERN.**—All work is let out on contract. The upper shaft is down 46 ft. A contract is let to put it down 25 ft. into the vein.

**ROUGH AND READY.**—This mine is started up by an English Co. to test the ore. If it turns out satisfactory, the Co. will purchase.

**NOONDAY.**—A new strike was made last week. The breast of ore is 15 ft. wide. The depth has not been determined. Assays show that the ore will mill, without assaying, \$100 to the ton.

**GEN LEE.**—Drifting from the old chamber, in a northeasterly direction up the hill. Running in fair milling ore and piling on the dump.

**ICEBERG.**—Taking out ore that will mill \$150 to the ton. Vein increasing in width and ore improving daily. Raising north-west and taking up a breast of 150 ft. wide. Also drifting northeast.

**ASHBURY G. & S. M. Co.**—The force of men will be increased next week. Work is going ahead in the tunnel and two side drifts. Occasionally a bunch of fair ore is found.

**CALUMET.**—This location is situated above the Ward Beecher tunnel. Running tunnel.

**BOWDEN.**—Located 200 ft. south of the Tom Paine. Work started up yesterday.

**NORTH AURORA.**—Lady's Chamber looking same as last week.

**ENERHARDT.**—Finding good ore in the open cut.

**SILVER WAVE.**—Same force of men employed as last week.

**GENESEE.**—Commenced sinking the 100-ft. shaft Tuesday. Going through fair ore.

**WEST SIDE WISSAHIRON.**—Late discovery. Situated above the Trench, a half mile east and running parallel with it. Ore resembles the Trench. Work commences Monday.

**TRENCH.**—Sinking in main drift and finding a good body of fine ore. Hauling ore to mill.

**BALD EAGLE.**—Sinking incline. Now down 125 ft. The ledge has increased to 7 ft. wide since last report.

**PHILA.**—Incline down 90 ft. Sinking in good ore. Ledge from 4 to 5 ft. wide.

**OUTSIDE DISTRICTS—SHELL CREEK.**—Good reports come in from the mines. The mill has arrived at Rubyville, and will be put up soon.

**TROY.**—A force of men left here yesterday for the Co.'s mines. The mill will start up as soon as the furnaces are completed.

**MILLS—INTERNATIONAL.**—Running 60 stamps on ore from Ward Beecher and North Aurora mines.

**SWANSEA.**—Running on East Sheboygan and custom rock.

**MANHATTAN.**—Running on Ward Beecher consolidated.

**STANFORD.**—Running on South Aurora rock.

**BIG SMOKY.**—Running on Hidden Treasure and company rock.

### Arizona.

**IMMENSE YIELD OF GOLD.**—Prescott *Miner*, Sept. 30th: C. Y. Sheldon has arrived from Lynx Creek, with \$1,135 in gold dust, and \$200 in specimens, the proceeds of about 44 tons of Vernon ore.

The following sales have been recorded since our last issue:

J. Walker to R. D. Stubblefield, 200 ft. in Gordon & Power location, on Tiger lode, \$4,000.

M. Mills to L. Bashford, 100 ft. in same location, \$2,000.

M. Mills to A. J. Moore, 100 ft. in same location, \$1,500.

Hammond to Stubblefield, 100 ft. in same location, \$1,500.

Stubblefield to L. Bashford, 100 ft. in same location, \$1,500.

**ITEMS.**—The Tiger and other Bradshaw lodes are yielding richer silver and gold rock than at any previous time.

The Del Pasco mine was running early this week.

The owners of the Great Sexton have tapped the mine with their tunnel, and like the looks of things.

Rich silver ledges have recently been discovered in Turkey Creek dist. Some of the ore has yielded \$2,000 to the ton in silver.

The Benjamin, La Plata and other silver lodes near Prescott are looking well. Specimens of ore from the Benjamin shown were rich in silver and gold, the former

being in chloride, ruby, horn and other varieties.

J. Dolan allowed us to handle a piece of gold weighing \$4.35, which he had taken out of 5½ lbs. of ore from Louisiana lode, Tiger Dist., upon which ledge he has a shaft 18 ft. deep.

### Colorado.

**BULLION.**—Clear Creek County, cor. of Central Register, Oct. 11th: The Stewart Reducing Co. shipped on the 4th inst. \$1,000 worth of silver bullion, and for the week ending the 5th, 229 ozs. valued at \$6,797 coin. Palmer & Nichols' shipment amount to \$1,000 every day. Prof. Dihin is shipping about \$500 worth of silver daily. On the 5th, he shipped two silver bricks, from Belmont ore.

**Caribou Post, Oct. 7th:** The Mammoth lode near Cardinal, is vigorously worked. Dr. Hopkins, the owner, has a complement of men in 3 shafts.

The Sturtevant, west from the Mammoth, is a strong, true vein. It assays at the rate of \$1,300 in gold, and about 25 ounces in silver per ton. The main shaft is 23 ft. deep and work progressing.

The Elephant is one of the mammoth veins of Caribou Hill, with black sulphurets in a soft, white gangue, with a six ft. crevice, easily mined.

The Monitor, is well-cripped to the depth of 64 ft.

**MINERAL HILL.**—Sherman, an early discovery, is next to the Caribou, the most valuable mine of the hill. The main shaft is 70 ft. deep.

In the Morning Star they have now attained a depth of 74 ft., with a gradually widening crevice.

The Illinois, has since its discovery been opened 20 ft. deep. Tests made by their best ore show its value to be \$500 per ton.

**ITEMS.**—Georgetown *Miner*, Oct. 5th: The timbering on the Cliff mine is completed and the workmen are now taking out ore. We record another discovery on McClellan Mt. named the Holden.

The surface ore, 1,400 pounds by mill treatment, yielded, the first-class 636 ozs. per ton, and the second-class 159 ozs. per ton. Leavonworth Mt. is yielding an immense quantity of rich ore. Thompson & Co. are digging out float rock in considerable quantity. The mineral, from 4 to 5 tons, this company have dug out runs 600 ozs. per ton. The crushing and sampling works of the Trenton Gold and Silver M. Co. at Silver Plume, is running on rich ore from the Stevens, Pelican, Silver Plume and Snowdrift.

**SUMMIT Co.**—The Chautauqua, Snake River dist. the discovery shaft is 60 ft. deep.

The Silver Wing, the property of the St. Lawrence S. M. Co. is rapidly assuming the character of a first-class mine. The ore vein is large and the indications are that a rich body of milling ore will soon be reached. The reduction works are in a forward state of completion.

### Idaho.

**BOISE STATIONER.** Oct. 15th: Advice from Yankee Fork diggings are not flattering. Parties just in report that the first prospects obtained were delusive, and that the miners are discouraged, and abandoning the camp.

### Montana.

**MOOSE CREEK.**—Deer Lodge Independent Oct. 7th: The Dixie has now an 8 foot ledge and is turning out a superior quality of ore. Two astras are upon rock from it and this number will be doubled the ensuing season.

**BEARTOWN.**—Cor. same: A \$100 nugget has been taken out.

**CARLE CITY.**—J. D. Bell of the placer mines tells that the last run made from their mine was highly satisfactory. They are busily in making flume boxes, expect to have ready for use by early Spring. They have on hand a large number of tons of fine quartz, picked up while sluicing, which they will have crushed next week.

### Utah.

**PROOHE BULLION.**—S. L. Tribune Oct. 11th: W. F. & Co., received on the 6th, from the works of Raymond & Ely, 15 bars of fine bullion, worth \$43,561.41; and from the Meadow Valley Works, 8 bars, worth \$11,357.60.

From East Cañon, Pioneer mills, 4 bars worth \$6,393.99.

**COMET.**—The ore is a beautiful carbonate and will assay very high. The claim is being developed by an incline.

**DEEP CREEK MINES.**—About 150 miles from S. L. City in Tooele county.

**SALE.**—The Silver Cloud mine, Camp Floyd dist., has been sold to an English Co. for \$500,000.

### Mining Stock Market.

THURSDAY EVE., Oct. 19th, 1871.

The sales at the San Francisco Stock Board for the week ending Thursday the 12th inst. were unusually large, amounting to \$1,200,500. The monthly sales since January 1st aggregated nearly \$95,000,000, the largest amount on record and over 100 per cent. in excess of the same time last year. Last week the share market was more active than it has been for some time. The Chollar-Potosi report 600 tons out last week. The last weekly report of the Hale & Norcross shows 1,200 tons of ore extracted and 2,500 tons of low grade on the dumps. From the Savage 1,032 tons were extracted. At the recent annual meeting of the Eureka Consolidated Co. there was a surplus of \$130,000 cash assets, The Eureka Co. of Grass Valley, held their annual meeting this afternoon. Trustees elected were L. S. Adams, (President); Wm. Watt, (Supt.); R. T. Morrow, Geo. W. Beaver, M. Bulkley, F. Berton was chosen Treasurer and R. Wegener, Secretary. The receipts for the year were \$567,349, and \$360,000 were disbursed as dividends to stockholders.

## INDIFFERENT METALLURGY.

(From the Overland Monthly.)

(Continued.)

Are the efforts now being made by these Eastern cities to be ignored by us? Must we continue to look upon their gigantic exertions with apathy? Shall we allow them to offer inducements for the shipment of ore which we ourselves possess, and remain inactive? Our assumed superiority is an insufficient excuse for our apparent disinterestedness. That superiority is, in reality, entirely mythical. The cost of transit of ores from the great basins of Utah and Nevada to any of the great centers of the East, compared with the same here, is more than counterbalanced by the cheaper labor they can employ in their subsequent reduction. And the coal mines of Pennsylvania, from whence they draw their fuel, are as conveniently situated to them as those of Sydney and Nanaimo are to us. The monopoly of any particular branch of industry, by any particular city or locality, is mainly attributable to the priority of its establishment by them, of which fact we have numerous examples in the cities of the Eastern Hemisphere. Swansea, for instance, has thus become the smelting-place for the metalliferous products of the civilized world. If we only allow the Eastern cities to anticipate us in obtaining the business of reducing the ores of the West, then we may rest assured that they will retain it, in defiance of all efforts which we may hereafter think incumbent upon us to make.

As to the manner in which the treatment of our own ores would materially benefit us, it is only requisite to state, that, in addition to the large surplus of lead which leaves our local smelting works, upwards of a thousand tons of lead ore leaves this city annually for treatment in Europe, and returns to us again, in a manufactured condition, as white lead, amounting in the aggregate to about 1,200 tons per annum. Furthermore: being extensive consumers of sulphuric acid, we are now compelled to import large quantities of sulphur from Sicily for the purpose of manufacturing it. In Europe, the necessity for economizing in every branch of industry has caused them to devise means for saving all the by-products of ores. By employing the *Gerstenhofen* furnace for roasting, the sulphur contained in the copper ores is at once converted into sulphuric acid. Previous to the application of this method, the annual value of the sulphur wasted in Swansea was estimated at \$1,000,000. Provided we reduce our own copper ores, we would extract an ample supply of sulphuric acid, to the utter exclusion of foreign importations.

Our civilization being a progressive one, the industries increase with the development of the country, and a demand is created for the various minerals which we possess. It remains only for us to convert them into that state wherein they can be applied. To do this, we must reduce them. It is in neglecting to reduce its ores that Chili finds its financial ruin. Its deposits of copper ore, which are unequalled, excepting by our own, are being exhausted for shipment elsewhere. They undergo no process of purification in the country; consequently, the actual labor employed in its industries is limited to that which is engaged in its mines.

Another thing connected with our metallurgy, which has been overlooked by us in the past, is that of the ignorance of those engaged in the development of our mineral wealth. This has already materially injured our interests. The immense quantity of the precious metals that has hitherto been produced has been extracted from our rocks at an enormous sacrifice and waste, resulting altogether from the incapacity of those engaged in its extraction. We cannot understand why the California miner should not receive an education that will fully qualify him for the duties and responsibilities that necessarily devolve upon him, as well as any craftsman in the mysteries of his trade. It is well known that one educated in any of the European mining-schools is altogether incompetent in the management of our mines, and utterly at a loss as to the proper manner in which to treat their products. He is little, if any, better off than him who has had none of the advantages of a scientific education. He is, in fact, compelled to divest himself of much of that which he has been taught, and to go through a new and entirely different course.

The cause is apparent. European mines are already opened. The mode of working them, as at present carried on, and in which the student is instructed, has been

the same for generations. Our mineral deposits, on the contrary, are in their primitive condition. The character and peculiarities of the formation have to be studied and understood. The mines require opening. To open them successfully, and to develop them in an advantageous manner, it is now actually requisite to obtain a large amount of local practical experience. Many expedients have to be resorted to, for the sake of experiment. These deficiencies are naturally injurious to every one interested, and the evils attending them can only be obviated by a systematic local, scientific, mining education, so as to familiarize the future miner with all the difficulties he will have to contend with, in opening and working our mines.

The treatment required by the ore, after its extraction from the bowels of the earth, is also foreign to that of all other countries, and peculiar to itself. Its chemical composition is such that it requires a new and unknown treatment to the foreign student. The specimens of the minerals of one country cannot be taken as representing the ores of another, and the manner in which the ores of one is successfully operated upon does not necessarily apply to those of another. Each country requires a special treatment of its ores, which is applicable to them only. The European student is instructed only in the best manner of treating the ores existing in the particular locality wherein he receives his education. The samples given to him for analysis are obtained from adjacent mines, and it is with them only that he becomes familiar.

Having no schools in California wherein a metallurgical education is made a specialty, those who are desirous of obtaining such are now compelled to go to Europe for it. This is not only a great loss to the student, but it also deprives our State of the fruits of his researches and analysis of minerals during the time he is receiving his education. His labors enrich the metallurgical knowledge of that particular country only.

## SELF INTEREST.

BY WM. M. ORMSBY.

(Read before the Liberal Club of New York City, at its 2d Anniversary.)

Scientifically considered, the speeches here to-night are mainly the exhalations of the lungs—carbonic acid gas—a deadly poison. How beautiful is Nature thus to give us so much delight through the waste of respiration a mere excretion of the system.

In like manner is human selfishness, that hateful, ugly, fearful thing, made to do duty as the preserver of the species, the mainspring of mental, moral and physical progress. In spite of himself, the most selfish man must work for his species when he works for himself. Is he a miser? His accumulated store must ultimately do duty for the use of others.

Is he an artist? His beautiful work is equally the property of his fellow men. Is he a speculator in food? His greed will save the scanty store from waste that it may be hived for the days of famine. Is he a merchant? His ships must sail to distant lands to bring their rare and costly products for the use of his less wealthy neighbors. Is he a writer? His brain-work must contribute to the amusement or culture of the unlettered or ignorant.

In every direction that human selfishness extends, it must include more than one in its results—though not perhaps in its motive.

How all potent, far-reaching, untiring, sleeplessly vigilant, is selfishness! Shall we be chided then for seeking to enlighten it, and to recognize in it the most powerful agent for human improvement. It is not a question whether it is degrading for men to be moved by self interest? Is it a fact?

Science is not ashamed to say that man has descended from a monkey! Need it shrink from the acknowledgment that the motive for man's noblest actions is his own gratification? Is our generosity less good because we take our pay in the pleasure of it?

But, says Universalogy, "what is the use of thus constantly reminding us of the ignoble origin of our noblest deeds? Our food was once the muck heap. Why tell us of it!" For this reason; that some men are constantly telling you that it was not a muck heap, and that the best fertilizers are fragrant essences. The point is not

whether it is agreeable to hear it—is it true?

But again, says Pseudo-Positivism, what is a name? You have stolen our "*Altruism*" and called it "Enlightened Self Interest."

There is this in a name—that Positivism makes virtue a self denial and leaves you to infer that in order to do right you must make yourself miserable. The Book was nearer right when it said: "It is better to give than to receive." Men give because they think it is better, and take their pay in self satisfaction.

What need we care for the sneering taunts of those who say we are constantly "grinding axes in the Liberal Club," where don't they grind axes? Do our open doors harm anybody? Is our unequalled elocution less pleasing because it is an advertisement?

Surely not, for you are all always glad to hear it. Is our scientific exposition less valuable because it comes from professional instructors? Are our medical lectures less instructive because they are delivered by a physician in growing practice? Is our altruism less advantageous because its advocate is the prospective high priest of positivism? Is our phonetic reform of less value because its champion is the author of the complete phonographer? Shall we cease the advocacy of protection because the American copper interests are to be benefitted thereby? Are our addresses on longevity of less account because their author happens to be President of an insurance company? Is our universalogy less a great discovery because its prophet publishes a hook?

Is our political economy less instructive because it is expounded by enthusiasts who have made it a life study? Is our exposition of the Industrial Exhibition less interesting because somebody may make money by it? Is our scheme for the preservation of wood less valuable because it may be a source of profit? Is our enlightened self-interest less a great system of ethics because he who preaches it is a conceited spouter? If we were all monomaniacs the world would get some benefit from our hobbies.

Ponder these things, and judge men's actions by the results and not the expected results. You will then see that people may intend to be charitable and generous, and lofty, and high-minded; while in fact they may be doing the silliest and most hateful things to society; while another may intend to be selfish and only succeed in benefitting others.

Now please don't represent me as saying that all the generous people are bad, and all the selfish people good.

What I do say, is that self-interest is a pent-up human impetus. I believe that the greater part, and that the system of nature is wisely so ordained that upon the whole this self-interest is a benefit to the race, because it is not all blind and ignorant; but is all the time growing more far-seeing and good—sacrificing present pleasure for future and more permanent pleasure, and growing more and more conscious that the rights, duties, and interests of no one can conflict with the legitimate rights, duties, and interests of any other one. We may all then look out for the high No. 1 as well as the low No. 1; the mental and moral as well the physical No. 1. Let every one really look out for No. 1 and we shall have a perfect humanity.

## Prolific Growth of Cherries.

We present herewith a correct representation of the remarkable cherry tree limb which we received some time since, (by the kindness of Mr. Wilkinson of the Deaf and Dumb Asylum), from the nursery of Mr. Seth Luelling, on the Willamette river, near Milwaukie, Oregon. This limb was seven-eighths of an inch in diameter at the point where it was severed from the tree, measured five feet in length, contained 354 cherries, and weighed with its fruit seven pounds. The cherries are very large, nearly one inch in diameter, and are of the Royal Ann variety.

After exhibiting the limb for a few days on Montgomery street, it was cut into short lengths and placed in alcohol, in which condition it was shown at the late Mechanics' Industrial Fair, and may now be seen at the office of the PACIFIC RURAL PRESS, No. 333 Montgomery street.

The cherry is one of the most delicious of all small fruits. It delights in a rather heavy soil, and a high and dry locality. It is a very tender tree to cultivate and re-

quires the greatest care and attention. So highly is it appreciated, that well grown, healthy trees of approved varieties, in the vicinity of our Eastern cities, have been known to represent a capital of one and even two hundred dollars, and so rated in the transfers of real estate. Such trees in the vicinity of New York or Boston will often produce an annual value of \$30 or \$40 each.

When located in a suitable soil, and properly cared for, the cherry proves a very long lived tree. One of the earliest cherry orchards in the country was planted in 1780, in the "Delaware Highlands," near Wilmington, in the State of Delaware, a locality which seems peculiarly adapted to the growth of this tree, and which answers well to the description above given

of the soil best suited to its growth. Most of the cherry trees originally planted in this orchard are still flourishing. Generations of trees from this stock have been planted near to the original locality and have passed away, while the veteran pioneers still flourish and yield annually large crops of fruit.

A NEW invention consisting of a machine combining the advantage of an alarm pump, fire engine and ship's pump, was recently tested at Dover, N. H., and is said to have given great satisfaction to a number of interested gentlemen present at the trial. The signals are made by means of a whistle, blown by compressed air in the pump, and this whistle, under ordinary circumstances, can be heard three miles. The signals for fog, pilot, distress, for course, etc., consist of long, medium and short blasts, according to the key furnished, and by a similar process a telegraphic alphabet can be used for communication. By changing the action of the machine, water may be pumped from the ship, or into the ship to extinguish fire. The entire apparatus is in very small compass, is very simple, and with all its arrangements cost but \$150.

The Mississippi, is lower than it has been for some years; cattle now roam where a few months ago steamboats navigated.

## USEFUL INFORMATION.

## The Egyptian Pyramids.

Many erroneous ideas are prevalent with regard to these wonderful structures, and particularly with regard to the Great Pyramid of Cheops. The latest and most authentic researches fairly disprove the early and still common idea that they are tombs of Egyptian kings. All the known burial places of the ancient kings of that country, are elaborately carved and inscribed with emblems of self-glorification. But it happens that the greatest of all the pyramids, which, if any would have been so inscribed, contains nothing of the kind. Nothing but plain geometrical surfaces are seen, all of exquisite workmanship. The faces of the stones are worked into true mathematical figures, with their edges and surfaces ground to perfect lines, and polished, so that the joints are almost imperceptible, no thicker than a sheet of paper.

The Great Pyramid is thought to be the oldest, as it is the most perfect of all in construction. It is perfect in design and uniform in execution throughout, and is also constructed of uniform quality and character of material from top to bottom. The other pyramids are less perfect in construction, are not built of uniform material, and do not present a uniformity of design. The great pyramid is "founded upon a rock,"—compact limestone—whose surface is about 100 feet above the general level of the valley of the Nile. Deep excavations were made for the foundations. If it had been built in the valley, it would undoubtedly have lost its level long ere this, and perhaps have sunk or been covered well up to its summit. It is supposed by some that the walls of Babylon, which were built upon such a foundation, between settling and the natural accumulation of drift, have been entirely covered up from sight!

The height of some remarkable structures on the earth are as follows: St. Paul's, London, 360 feet; St. Paul's, at Rome, 432; Strasbourg Cathedral, 468; Pyramid of Cheops, variously set down at from 484 feet, 11 inches, to 486 feet, 3 inches. The latter is thus the largest and highest, as well as the oldest and most enduring monument constructed by the hands of men. With 4,000 years' of experience since this structure was completed, the best of men cannot excel it either in design or perfection of workmanship.

**WHAT TO DO IF THE CLOTHES TAKE FIRE.** Perhaps three persons out of four would rush right up to the burning individual, and begin to paw with their hands without any aim. It is useless to tell the victim to do this or that, or call for water. In fact it is generally best not to say a word, but seize a blanket from a bed, or a cloak, or any woolen fabric—if none is at hand, take any woolen material—hold the corners as far apart as you can, stretch them higher than your head, and running boldly to the person, make a motion of clapping in the arms, just about the shoulders. This instantly smothers the fire and saves the face. The next instant throw the unfortunate person on the floor. This is an additional safety to the face and throat, and any remnant of flame can be put out more leisurely. The next moment immerse the burnt part in sweet oil. Next get some common flour, and put it on the burn, about an inch in thickness, and if possible put the patient to bed. Let the flour remain until it falls off itself, when a beautiful new skin will be found. Unless the burns are deep, no other application is needed. Dry flour for burns is the most admirable remedy ever proposed, and the information ought to be imparted to all. Dredge on the flour until no more will stick, and cover with cotton batting.

**TO PREVENT BOILER EXPLOSIONS.**—The record of English patents, shows one designed to prevent explosions of steam boilers, which may be worth noticing. The device consists in providing a hole in the upper part of the boiler, and covering the same with a material (India-rubber for example) of sufficient strength to withstand ordinary pressures, but which will give way and allow of the escape of steam under excessive pressure. The India rubber is clamped to the boiler by a flanged tube formed for the purpose.

**IMPROVEMENT IN THE LOOM.**—An "air-blast loom" has been invented in England, in which the shuttle is driven by means of the sudden release of a very small quantity of compressed air, acting directly upon the shuttle, without any of the complicated machinery required in former contrivances of the kind.

## Something about Toads.

The scientific Professor Wood has been studying toads. He concludes not only are they harmless, but they are absolutely and directly useful to us, perambulating our fields and gardens at night, devouring vast quantities of injurious insects which could never be destroyed by the hand of man. The mode in which a toad takes his prey is very curious. The singularly beautiful eye of the toad is as quick as it is bright, and if within range of its vision an insect or a grub should happen to move, the toad is sure to see it and almost sure to catch it. First the toad holds its head as high as possible, so as to make sure of its prey, and then crawls slowly toward it, preferring to get under it if possible. When it is nearly within reach it gazes intently at the insect, its mouth being brought nearer. Something pink then flashes from its mouth and the insect vanishes as if by magic. The pink flash is the tongue of the toad which is formed in a rather curious way. The base of the tongue is fixed close to the front of the lower jaw, and is long and tapering, the tip pointing down the throat when it is at rest. When however it is used for catching prey, it is thrown out with a sort of "click," and the tip, which is covered with a glutinous secretion, adheres to the insect and conveys it down the toad's throat before the prey has time to make an effort to escape. When the toad swallows its prey it does it with a mighty effort, during which the eyes almost disappear, the size of the insect having little to do with the vehemence of the demonstration. Some times, when a large beetle is swallowed, it does struggle, but too late, and for some time its struggles may be seen through the thin ribbed sides of its capturer; the toad sitting the while in perfect composure, not in the least affected by the scratchings and kicking that are going on in the interior.

**MARE'S MILK.**—Koumiss, the Tartar drink prepared from mare's milk by fermentation, is recommended by a Polish physician as an excellent remedy in all complaints arising from feeble digestion, in nervous irritation, and in different forms of dyspepsia. He says that other kinds of milk will yield it, though that of mares is preferable. The true Koumiss is a piquant, sweetly acidulous, fragrant liquor, which, when taken in large quantities, produces a pleasurable excitement without any bad after effects. It may be varied as to its constituent elements by proper manipulation so as to suit different constitutions. The patient is restricted to its use as food exclusively, beginning with small quantities, at short intervals, and gradually increasing his allowance until it reaches a gallon daily. On this diet as much as ten pounds of flesh has been known to be gained in a month, the Koumiss containing all the plastic, respiratory and heat-giving elements of the body in a form most easy of assimilation. Here is a chance for some enterprising man to start a new system of treatment. A Koumiss cure would be a novelty, and if at all successful, would make a fortune for its manager.

**MODEL RAILWAY MANAGEMENT.**—At Kalamazoo station, midway of the Michigan Central Railroad, there sits an operator at all hours of the day and night (relieved of course by shifts,) who receives telegrams from each train on the road the instant it enters or leaves a station, so that he holds or starts it at will. His eye is literally on the entire line, continually making a collision next to an impossibility; and the immense single track quite equivalent, so far as safety is concerned, to the double track roads. As a result of this careful management, not a drop of blood has been shed inside of a car on this road for over 16 years, during which this perfection of arrangement has been in operation.

**PLANT GROWTH IN WARM AND COLD CLIMATES.**—The active principles of plants, according to recent investigations, are more concentrated in the leaves of plants grown in cold climates, where the vegetation is less vigorous than in warm climates. In illustration the well-known facts are cited that tobacco grown in northern regions is stronger than the same plant raised in mild or tropical regions, and celery, it is stated, is affected in the same way by the influences of temperature and moisture.

**A CLOCK IN A PARASOL.**—A Detroit jeweler exhibits among other fancy goods in his show window a parasol with a perfect clock in the handle.

## GOOD HEALTH.

## Medical Electricity.

**EDITORS PRESS.**—Not far from thirty years since a work was published in which occurs the following language:—Electricity is a subject which has long engaged the minds of philosophers, many of whom have differed very materially in their conclusions respecting it; yet sufficient has been ascertained in regard to it to enable those who are so disposed, to build their structures on practical science, untrammelled by the dogmatic theories and problems of a speculative age." Again, "Electricity we consider the first, the all-powerful principle emanating from the Creator, the power by which all things were made, the grand fiat of Nature, the source of vitality itself!"

This was penned by a philosopher and philanthropist, by whose research thousands of lives have been saved, and who contended that facts and experience should be the only basis from which to act against the enemy of life in any form—that no person had any right to surmise or guess at anything pertaining to the health or life of any one, when that surmising was to be applied to curing disease.

There are in the human organization two distinct systems of nerves, by which it can be seen, with what infinite wisdom nature works; that while one system of nerves is ordained to govern, guide, and regulate the growth, action, motion, strength, sustenance, etc., of the human body, another set has been subsequently constituted as sentinels, to watch, to notify, to give the alarm when danger approaches. Now, hy, or through, the medium of these two systems of telegraph lines, are brought all the workings of the intricate machinery of life, of growth and decay, of composition and final dissolution. How very necessary then that all and everything pertaining to an element which works through these two systems of nerves, to produce life or death, health or disease, happiness or misery, should be the subject of the clearest, most concise science, capable of being communicated, of being reduced to the utmost simplicity for the general understanding.

The modes usually employed for the application of the electrical current—by taking hold of the two electrodes with the hands, only gives a shock across the shoulders, and is of very little use toward revitalizing any part of the system. The positive electrode should be placed above or nearest the main nervous center, from which the vitality arises that supplies the rest of the system, and the negative below or upon the part necessary to restore. By so doing, this powerful revitalizing agent is made to do a double duty—that of quickening the carrying of sustenance to the diseased part, and the passing away with the return current of the morbid elements present. If judiciously applied, permanent invigoration ensues, unaccompanied by the prostration usually consequent upon tonics or stimulants as ordinarily applied.

F. M. S.

San Diego, 1871.

**THE SPOON AS A MEASURE IN THE SICK ROOM.**—A writer in the Canadian *Pharmaceutical Journal*, who has examined the subject critically, says that teaspoons have been gradually growing larger of late years, the spoon of the last century having been only about two-thirds of the size of that in common use. He adds, however, that three sizes are made at the present time—large, medium, and small, containing 95, 85, and 60 minims respectively. Tablespoons, also have increased, and vary from 4.5 to 6 fluid drachms in capacity. He infers that the dose of certain articles may be unsafe, if a teaspoonful or a tablespoonful be ordered, and proposes to abolish the dessertspoon as a measure, substituting two teaspoonfuls. It is rarely, we apprehend, that more than a drachm is administered as a teaspoonful, or more than half an ounce as a tablespoonful. On the contrary, nine times in ten, according to our experience, an ounce mixture, when ordered in teaspoon doses, will afford more than eight doses, and an eight ounce mixture more than sixteen tablespoonfuls. Nurses seldom fill the spoon to its utmost capacity.

## What a Physician's Office Should Be.

Professor McGraw, of the Detroit Medical College, in an address to the last graduating class, raps certain practitioners over the knuckles in the following style: "I have been in doctors' offices where a skull grinned from one corner, ghastly anatomical plates hung from the walls, and splints, suggestive of broken bones, were placed conspicuously in every corner. What a delightful resting-place for a sick woman, visions of death, disease, and injury, greeting her on every side! Now, gentlemen, make your offices, pictures of comfort and cheerfulness. Banish from them every sign of your professional occupation, so that your patients may enter them not only without disgust, but with actual elevation of heart. I think, I need hardly say, that your apartments should be scrupulously clean, although I can recollect too many rooms occupied by physicians, whose windows were festooned with cobwebs and dried flies, and whose floors were stained with tobacco spit. I have been pleased sometimes to hear the occupants of such offices groan about the lack of custom, for if it is the duty of a physician to preach the virtue of cleanliness, he should himself be a living example of his own doctrine. Filthiness in a physician is like dishonesty in a merchant, the very worst of sins." We know of at least one physician in this city who has ever carried out the above idea.

**"BOILING OUT" THE STOMACH.**—At a late meeting of the Atlanta Academy of Medicine, a member gave an account of his favorite method of emptying the stomach when other means had failed, by taking advantage of the effervescence of acid and alkali. A negro boy set 14, was insensible from supposed poisoning by stramonium, and it was found impossible to induce emesis by any ordinary process. "An ash-hopper close by suggested the idea for acids and alkalis to *boil out* the supposed poison. With no time to lose, gave a teaspoonful of lye and the little tartaric acid he had, drenched down, followed by another teaspoonful of lye and a little soda—all he could get—and rolled him over a few times, when he boiled out several quarts of half-masticated, raw, red yam-potatoes. The boy remained insensible twenty-four hours longer, deaf the same length of time, and blind for about eight hours, had some fever on reaction, but made good his recovery." A great hoy that!

**POTATOES IN FOUULTICES.**—Perhaps it is not generally known how much pleasanter and more agreeable, as well as efficacious, is a poultice made of potatoes than one made of bread. It keeps longer, can be reheated several times, and does not wet the clothing. Peel, boil and mash the potatoes; inclose in a muslin bag and apply to the affected part. To hoil them in hot water has a very soothing effect, and enhances their virtue. A poultice made of hoiled beans is by some, thought to be better than potatoes, but both are worthy of a trial.

**EFFICACY OF RE-VACCINATION.**—It is stated in the *Edinburgh Medical Journal* that at a recent meeting of the Glasgow Medical-Chirurgical Society, "not one member was able to adduce one single instance of a revaccinated person having taken the small-pox." The sentiment maintained that when small-pox prevails, every individual above five years of age, in an infected locality, ought to be re-vaccinated. We believe this is the universal conviction of impartial medical observers in all parts of the world.

**CURE FOR CONSUMPTION.**—The following prescription was furnished to the *Lon. Med. Press and Circular*, coming from a clergyman in the West of England, reputed of great skill in diseases of the chest: Isinglass, 1 oz.; eringo root, 1 oz.; garden snails, ½ pint; hartshorn shavings, ½ oz.; three dried vipers from Butler's Convent Garden; 1½ pints water. Boil down to a pint. We suspect it was stolen by the clergyman from Li-po-tai, who was once ardently patronized by a distinguished clergyman of San Francisco.—*Pac. Med. Jour.*

**COMPOSITION POWDER.**—The justly celebrated "Thompsonian Composition Powder" is composed as follows:

Bayberry bark, 6 ounces; hemlock bark, 3 ounces; ginger root, 3 ounces; cayenne pepper, ½ ounce; cloves, ½ ounce.

All finely pulverized and well mixed. Dose: half a teaspoonful with a spoonful of sugar. Put in a teacup and pour on it a half a cup full of boiling water. Let it stand a few minutes, then fill up the cup with milk or water and drink freely.

Chemistry of the Washoe Process; New Placer Mining Enterprise.....	248
Map of Cottonwood mines—III.; Our Home Industries.....	249
Domestic Economy; Domestic Receipts; Mechanical Hints; Life Thoughts.....	250
Parasitic Worms in Farm Stock—III.....	252
NOTICES OF RECENT PATENTS.....	252

DEVELOP HOME RESOURCES.—According to the Calaveras Chronicle, a large amount of money has been sent out of that locality for the development of the silver mines of Nevada, not one dollar of which has ever been returned; while but very few of those have been benefited who have chosen to transfer their individual field of labor from this locality to Silver Land. The Chronicle makes use of this fact as a text from which to urge upon people generally the policy of the development of their home resources, when they have any, as is the case with Mokelumne Hill, and vicinity. Its advice is applicable to many other localities.

FARE REDUCED.—The C. P. R. R. Co. have reduced the fare from San Francisco to Oakland, Brooklyn and Alameda, to 15 cents; excursion tickets both ways, 25 cents. The monthly commutation rates are continued at \$3, which is cheap enough to suit everybody, being in fact lower than street railway fares have been in San Francisco. An immediate increase of travel on the R. R. followed the reduction, and the Chin-doo-Wan, the opposition boat on the Creek route to Oakland, has discontinued.

LOCOMOTIVES FROM PHILADELPHIA.—Two new locomotives for the California and Oregon R. R., recently arrived at Oakland wharf from the Baldwin Locomotive Works of M. Baird & Co., Philadelphia. They are of good size and fine construction.

## CHEMISTRY OF THE WASHOE PROCESS.

[Continued.]

### IV—Chemical Action of Salt and Bluestone.

Concerning this point considerable doubt has been entertained and various theories have been advanced. The two which have been most favorably received, but which differ widely, are the following:

Sonnenschmidt advances the more plausible and generally adopted theory. He claims that the salt and copper sulphate, by mutual reaction, form sulphate of soda, which is neutral in its action, and chloride of copper. The latter acts on the silver sulphide, and yields chloride of silver, sub-chloride of copper, and free sulphur. The sub-chloride reduces a second portion of silver sulphide, forming additional chloride of silver and sub-sulphide of copper. The silver salt is then attacked by the mercury; calomel, or sub-chloride of mercury, is formed, with metallic silver, which last forms amalgam with a second portion of the mercury. Or, in chemical equations,

Bowring, on the other hand, denies that any silver sulphide is chloridized, and asserts that, before amalgamation occurs, metallic silver is produced; that chloride of copper and mercury form sub-chlorides of both metals; the copper sub-chloride in contact with the oxygen of the air, becomes oxychloride, which acts on silver sulphide, giving free silver and oxydizing the combined sulphur. Thus:

Although oxychloride of copper may possibly be found at times, there appears to be no decided evidence of this in practice, or that it decomposes the sulphide of silver, while the experiments already recorded prove that both the copper chlorides, under favorable circumstances, do chloridize the silver sulphurets. The experiments, however, would indicate that the action of the chloride was more intense than that of the sub-chloride.

### V—Practical Experience.

In practice great doubt has arisen among experienced mill men as to the beneficial results of using chemical reagents in the Washoe process, a doubt strengthened by the growing custom of diminishing the quantity of salt and sulphate of copper without apparently diminishing the bullion product.

The action of these two reagents in the pan would appear clearly to indicate that the benefits derived from their use are partly to aid in converting the sulphide of silver into chloride, and partly to decompose such minerals as are but slightly attacked by mercury. The large quantity of iron present, however, must tend greatly to produce sub-chloride of copper almost as soon as the chemicals are thrown into the pulp. The value of these reagents must be considered as only secondary in the decomposition of a large proportion of the Comstock ores. The amounts employed are in most cases too small to effect any very favorable results. On the other hand, where sufficient quantities are employed it is always at the expense of preserving the necessary purity of the mercury.

The action upon the ore of salt without sulphate of copper, in producing any marked results may well be doubted. The use of sulphate of copper without salt, appears to be in greater favor, and its benefit, particularly where galena occurs in any considerable amount, seems pretty well determined by continued experience. Lead is one of the most deleterious metals in destroying the amalgamating energy of mercury, and at the same time is rapidly absorbed when

the two metals are brought in contact. Sulphate of copper expels to a certain extent (but not completely) lead from mercury, copper being amalgamated and sulphate of lead formed.

If a concentrated solution of sulphate of copper be allowed to stand upon lead amalgam the action takes place quite rapidly, mercury containing lead acting much more energetically upon the copper solution than when perfectly pure.

Another advantage in the use of a small quantity of copper sulphate is that under certain conditions a minute quantity of copper amalgam is formed, which causes mercury to act somewhat more vigorously in decomposing silver sulphide than when perfectly pure.

### VI—Action of Iron.

Iron, as a reducing agent, in the pan process probably plays an important part in inducing the favorable results obtained. This may occur in three ways:

1. It aids in great measure, the decomposition of the chloride of silver.
2. It reduces the calomel formed during the operation, the chlorine, combining with the iron, goes into solution, and the mercury is liberated. Thus a chemical loss of mercury is prevented, as well as its sickening by the coating of its surface with a film of calomel.
3. It undoubtedly assists directly in amalgamating, where the two metals are brought into close contact with the easily reducible sulphurets. This action of iron is obtained, not only from the constant agitation maintained, which brings the pulp and metal in contact with the sides and bottom of the pan, but also from the iron disseminated in fine particles through the pulp produced by the wear of stamps, shoes and dies.

### VII—Consumption of Iron.

The consumption of metal from the batteries and pans varies greatly in different mills, depending partly on the construction and grinding effects of the pans, and partly on the hardness of the castings. The following figures from two mills serve to show the quantity of iron per ton of ore worked reaching the pulp from this source. The quantity of ore treated is large enough to afford a very fair estimate of the metal consumed.

ORE WORKED.	LOSS OF IRON PER TON ORE.		
	In Batteries.	In Pans.	Total.
14,000 Tons.	2.78 lbs.	9.42 lbs.	12.20 lbs.
12,236	2.10 lbs.	7.14 lbs.	9.24 lbs.

The fine iron coming to the ore in this way is very considerable in proportion to the other minerals present. If 10 lbs. per ton are added from this source it is equal to 0.5 per cent. In the 3d class ore previously spoken of there is, including the iron from the batteries, less than 2.5 per cent. of iron-bearing minerals present.

[To be concluded.]

## Mr. Roche and the Mining Bureau.

We recently received the copy of a communication to the *London Mining Journal*, written by Hugh H. Roche, of a London Mining Agency, reflecting upon the Mining Bureau of California, on account of the failure of the English purchasers of the Independence mine of Sierra County, to re-sell said mine in the English market at an advanced price. Without any partiality towards the Bureau, we must say we fail to see any real grounds for complaint in the arguments of Mr. Roche. The Bureau does not buy or sell mines, and in this case simply by their hired expert, reported favorably, and it was purchased at what those versed in such matters consider a good bargain, and that with sufficient working capital the mine would prove itself worth several times its cost. As near as we can learn, the real cause of failure to sell the Independence in London is in the fact that the price paid for it here was publicly announced there, and capitalists everywhere do not relish paying largely

advanced rates. This seems to be a sufficient explanation for the failure.

We have also received a communication referring to Mr. Roche's article and giving some facts regarding the organization and objects of the Mining Bureau, which we do not think necessary to insert in the absence of a full publication of the communication in the *London Journal*. Such an organization as the Mining Bureau, honestly carrying out its professions to prevent the sale of worthless mines, is much needed, and until we are assured of its working ill, we believe in its having a fair chance.

## New Placer Mining Enterprise.

Many people believe that the rich auriferous gravel deposits of California are almost entirely worked out, and that it is necessary for the miners now to turn their attention to quartz. The superficial deposits found here in early days of such extent and richness as to attract thousands to our shore, to reap the golden harvest are comparatively exhausted, and in latter days we have been compelled to work the deep-lying placers at some considerable expense and trouble; still in many places in our State gravel claims are being worked with profit, but as a general thing capital is needed for their development as well as in quartz mines. One of the most remarkable and as yet undeveloped deposits in California is a place known as Turners Flat, in Tuolumne county, between Jamestown and Montezuma, on the Stockton and Sonoma roads. It lies close under the eastern wall of Table Mountain, which at this place rises perpendicularly several hundred feet. As long ago as 1855 a number of shafts were sunk and where the bed-rock was reached, in many places, the yield was large, prospecting all the way from \$5 to \$2 to the pan, the average depth of gravel being 100 feet.

The great drawback to the working of this flat has been the volume of water, which at a certain depth has rushed in and stopped the work. They now intend running a tunnel from the western side of Table Mountain to lead the drainage into Mormon Creek, and thence into the Stanislaus river. After this is done the flat can be worked by the hydraulic method. A large amount of auriferous gravel in Table Mountain will also be used in completing this enterprise. Several claims on this flat, the Humbug, Buckeye and Hughes' tunnel, have proved very profitable to their owners. A company is now making a ditch designed to furnish water to the rolling gravel hills on the lower Tuolumne, and making the larger deposits available. Our deep placer mines will yet be a fruitful source of profit to the State and capitalists are beginning to recognize this fact and to assist miners and prospectors in their efforts to develop them.

## PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING OCT. 10.

IDENTIFYING-STAMP.—George Pardy, San Francisco, Cal.

LUBRICATOR.—Erick Ehlin, San Francisco, Cal.

FRUIT PACKING-BOX.—Elisha D. Lewelling, San Lorenzo, Cal.

MEDICAL COMPOUND FOR SORE THROAT, ETC.—Francis Matilda Moore, Chico, Cal.

FRUIT-BOX.—Charles W. Weston, San Francisco, Cal.

METHOD OF REMOVING SUBMARINE ROCKS. Alexey W. Von Schmidt, San Francisco, Cal.

DRIER.—Charles H. Wakelee, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Map of the Cottonwood Mines.

The accompanying map is compiled from authentic resources, and represents the mines in the vicinity of Cottonwood Cañon, Utah territory. These mines have of late attracted world-wide attention, both from their extent and richness, and some of them have been sold to English and American capitalists at almost fabulous prices. They are now being worked with energy, and in most instances by parties having an abundance of capital—a thing so much needed in the early development of quartz ledges. The deposits of ore are of almost unlimited quantity, and consist mainly of galena, and carbonate of lead, containing a large proportion of silver and chlorides. Some of the ore is milled, but the majority requires smelting to be worked satisfactorily.

The vicinity of these mines is well wooded and watered, and the Utah Southern Railroad is being extended along the foot of the mountains, and a branch is contemplated to the mouth of the cañon, making increased facilities for transportation. There are two towns near these mines, Central City and Alta, although they are so near together that they may almost be considered as one. The elevation is 8,300 feet. There are a few smelting furnaces in the vicinity, and more are being erected, so that this branch of industry is being carried on successfully as well as mining.

The whole district is in a flourishing condition and miners generally are doing well. Our correspondent W. H. M. sent a complete description of the principal mines, which was published in the SCIENTIFIC PRESS of Sept. 2d, and can be read with interest in connection with this illustration. We will publish next week a fine map of Salt Lake and vicinity with 28 different organized mining districts, showing the relative position and size of each, line of railroad, course of rivers, etc.

**THE PURCHASE OF THE SILVER CLOUD MINE.**—The Salt Lake *Tribune* learns that the English purchasers of the Silver Cloud mine, Camp Floyd District, have visited and examined their newly acquired property, and are highly gratified with its appearance and prospects. From all accounts this is one of the most valuable mines in Utah. The amount paid for it was \$500,000. The sale was effected through the agency of D. C. Butterfield and A. C. Tichenor. We trust the purchasers may never have cause to regret their investment.

**SPRING VALLEY MINING CO.**—The *Butte Record* learns that the Spring Valley mining and ditch Co., of Cherokee Flat, have sold their mining and ditch property to an English company for \$1,200,000. The property is considered well worth the money paid. Hon. G. C. Perkins, of Oroville, receives \$200,000 for his share of the property.

**ON FILE FOR PUBLICATION.**—Mills, at Austin, Nev.; notes from Hamilton, Eureka, and different districts, by W. H. M.; San Diego mines, by "Quartz."

OUR HOME INDUSTRIES.

Business at the city foundries has been better of late than it has for a long time. The fact that more mining machinery is being made now in this city than at any time for the last three years speaks well for the successful and progressive development of our mineral resources, and for the skill of our mechanics.

The RISON WORKS are building some of the heaviest machinery that has yet gone on the Comstock lode. Two engines 20x40 with the boilers, for heavy hoisting works and pumping machinery for the Belcher mine; two engines 18x27 for hoisting works. They have just shipped a 60-stamp for the Brunswick mill and another one of 60 stamps for the Eureka, belonging to the Union mill. They are making 2,000 feet of sheet iron pipe for the water works in Central City, Colorado. Sheet iron pipe is also being made for the Spring Valley Water Works of this city, for Kiu-

At THE MINERS' FOUNDRY they are constructing an engine and a few pans for the new mill which is being built at Rye Patch, Humboldt county, Nev., in place of the one recently burned. They are also making a complete set of barrels, settlers, etc., adapted to Paul's amalgamating process, for a mill at Dun Glen, in the same county. A New York company is building the mill. The machinery is being put up under the immediate supervision of Mr. Paul. They are making also some diamond drill engines and apparatus.

THE FULTON FOUNDRY have just completed one, and are building another narrow-gauge locomotive; the first ever made on this coast. One of them is for the Seattle Coal and Transportation Co., and the other for Flanagan & Mann, of the Coos Bay Co. One of these engines had its trial trip this week, and worked very satisfactorily in all respects. They are making also at this foundry some castings for the water company.

At HENDY'S WORKS, on Fremont street, they are putting up a lot of Hendy's Improved Lamont regulators with a steam valve attached. This is a California invention and keeps the engine at a uniform speed and also gives security in case the governor belt breaks. Mr. Hendy is having made a lot of his concentrators; two for the Kanaka mill, Sierra county; four for the St. Lawrence mine, near Georgetown, El Dorado county; and six for the St. Patrick mine, to replace those which were burnt a short time since. He is making also two for the Virtue mine, about 60 miles from Portland, Oregon.

Cotton Industry in California.

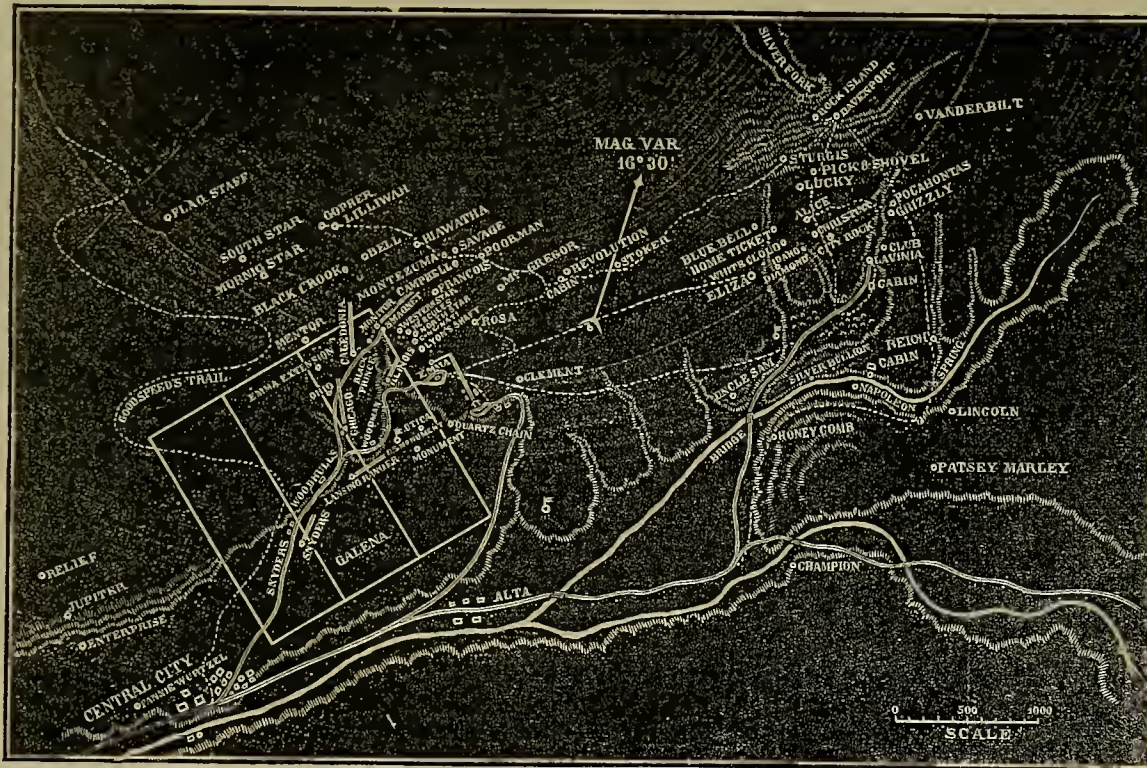

Many of the farmers in California are from the so-called "Cotton States." But few of them, however, have ever undertaken the raising of cotton on an extensive scale. One reason is sufficient to explain this. This industry, at the south, met a very sensible check by the rebellion and its results. The character of labor to be employed in the industry was also quite different. Slave labor ended with the result of the rebellion, and free labor, being rather independent and uncooperative developed itself at pleasure. The labor of the Chinese in California has been mainly utilized in the mining districts, and in the cities, for domestic aid.

There has been no grand scheme for developing the peculiar resources of the State of California, for the purpose of raising the great cotton staple.

About eight years ago Messrs. Livermore & Chester, associated with Mr. Solomon Jewett, experimented on an extensive scale in the rais-

ing of cotton on Kern Island, in Kern county, and with the most gratifying results. So satisfied was Mr. Julius Chester with the results of the experiment that he never lost sight of the value of the cotton enterprise, and upon the organization of the California Cotton Growers' and Manufacturers' Association, in April last, Mr. Chester opened negotiations with that organization having in view the settlement of their industry upon some of his property at Bakersfield, in Kern county. Recently, as we have already stated, the committee appointed to examine the several tracts of land offered by proprietors, with a view to decide the location of the plantation, having visited Kern Island, selected that locality as the best presented, and Messrs. Livermore & Chester will no doubt be gratified, as the pioneer cotton planters of the State, in seeing that industry established upon an extensive scale, on their original plantation. These gentlemen, we understand, sell the Cotton Growers' Association 30,000 acres of very suitable lands for stock in the concern, as we stated at the time of the return of the committee of location some two weeks ago.

**CALIFORNIA COAL OIL.**—Coal oil is being manufactured near San Buenaventura, Santa Barbara County, from crude oil collected near that place. Upwards of 1,000 gallons have already been distilled. The best of oil can be made, according to the *Ventura Signal*, for less money than it can be laid down there from New York.

MAP OF MINES NEAR COTTONWOOD CANON.

caid's Flat; for La Grande Gravel Mining Company; for water works at Virginia City, Nev., and for various other smaller enterprises. We notice that the engineer of the Washington, D. C., aqueduct is introducing large 48-inch iron pipe of this description into the works. This style of pipe has heretofore been used only in California but its superiority over the old is evidenced by it being used in this large aqueduct. Car wheel casting, an important business, is regularly carried on, and they are now making wheels for the Central Pacific, Southern Pacific, Los Angeles, and Oregon Central Railroads. They are supplying also the various city roads here, in Sacramento and San José.

THE AETNA WORKS are over-hauling engines, and making shafting, face plates, and tools for Flint, Peabody & Co.'s, cooper shop; repairing engine and putting new shaft in steamer Enterprise; repairing engine for steamer Belle, and making six propeller wheels for Goodall & Nelson's steamers. They are also making a propeller for A. M. Simpson's steamers; a house front for W. T. Garratt, pulleys, pillow blocks, etc., for the Crown Point Mining Co. Pipe is being made for the Buckeye mine; a new 30-inch piston for Meiggs & Gauley and one of the same size for the Oneida Mining Company. They are making smelting furnaces for both the Schenectady and Pacific Mining Cos. and a large amount of miscellaneous work.

THE PACIFIC have just finished a boiler and some machinery for the Cotton mill at Colima, and are making a 20-stamp mill engine, boiler, pans, settlers, etc., for an Eastern company, to go to Monitor, Alpine county. They have on hand a boiler and some pumping apparatus for the Pocahontas Mining company, and a boiler engine and quartz mill machinery for a mine in Arizona. They have just finished a set of hoisting works for the Savage Mine, and are making a similar set for the Yellow Jacket. They are fitting up a water-wheel and machinery to go with other machinery already sent to the Japanese Government. In addition, hoisting works are being made to go with the Wilson mill, in Banner district, San Diego county, owned by Mr. McMechan. They are making a lot of pipe of different sizes, from three to sixteen inch; irons for a lot of cars for the Virginia and Truckee Railroad, and are making general repairs on several steamers.

SAN FRANCISCO BOILER WORKS have just finished two large boilers, 38 feet long, 40 inches in diameter, for the Black Diamond Coal Co., and are making a 42-inch one for Mr. Bell of Sonora. They sent a short time since two boilers to the Antioch Distillery.

McAFEE, SPIERS & Co. are building two 54-inch boilers for the State Capital, and several others of various sizes.

THE COLUMBIA FOUNDRY is engaged altogether in making house fronts.

## DOMESTIC ECONOMY.

### Hints About Cooking.

[For the Press—By a Lady Contributor.]

There are many women who are called upon to do cooking, to whom it is hard and disagreeable work. They have not been taught *how* to do it, and go to work blindly, with a desperate feeling, thinking that if they have "good luck" it will come out all right, if not, they "cannot help it." To such persons we offer the following practical hints:

There are but few cook-books that do not confuse inexperienced cooks with a multitude of receipts, and neglect of small, but important details.

That cooking for a large family is hard work, no one will deny who has tried it for any considerable length of time; but to regard good cooking as the result of *chance* is a great mistake,—an error to which we are indebted for much of the unwholesome food that is set before us. By strictly following certain rules, and being exact in quantities, we may be almost sure of success. Cooking is hard work; but by care and attention it may become interesting work, and skill and judgment may be acquired.

#### How to do it—The Fire.

In the first place, your kitchen or whatever room you cook in, your pots, pans, and all utensils should be kept in perfect order. If you have not been in the habit of keeping them so, begin at once, and see how much it lightens labor. Secondly; and this is an important consideration, you must know how to manage your fire. An ordinary cooking stove may be mastered with ease. Understand all the dampers, so that you may regulate the draught; find where the soot and ashes collect, and remove them frequently.

These seem insignificant details, but we have known stoves to be condemned as "poor bakers," by those who ought to have known better, from a neglect of these simple rules.

Have your fuel convenient, and regulate the heat according to what you have to cook. Of course we cannot lay down rules for this; but we would say that a *fiery* fire is not necessary. It wastes fuel, and spoils almost everything.

For baking bread and roasting meat a considerable amount of heat is required; while soup, hominy and many other things, must be cooked gently, for three or four hours over a slow fire. By exercising a little patience you will soon learn how to regulate your fire, and save fuel.

#### Variety in Food.

As many of our readers are in the country, we will first make a few suggestions to them.

That we should have variety in our food is necessary for health as well as enjoyment. We know that it is difficult to attain this, when far from city markets, without some forethought; but by a judicious use of fresh eggs, butter, milk and cream, with now and then a chicken, every farmer's wife may keep her family supplied with good, nourishing food.

It is desirable to have fresh meat once a day if possible; but its place may in a great measure be supplied by various grains. Many sensible people are adopting the Scotch fashion of using oat meal pudding, because they find it to be pleasant and nourishing food.

#### Oat Meal—How to Cook It.

Two cups of oat meal, three cups of cold water, salt to taste, and boil gently for two or three hours. It must be stirred frequently, and more water added if necessary to keep it soft. Cracked wheat, hominy or corn meal may be cooked in the same way, and furnish a pleasant variety.

If you have plenty of milk it will be an improvement to add a little a few moments before taking up. These dishes are nice hot or cold, and may be served with milk, syrup, or as a vegetable with meat.

#### Eggs

may be cooked in a thousand ways, our French neighbors tell us. We will not try them all, but are sure every one will like them cooked in the following manner:

Take an ordinary plate that will bear heating. Place on it a piece of butter the size of an egg and melt it. Break six eggs into the melted butter, carefully, so as not to break the yolk. On each egg sprinkle a little salt, pepper and grate a very little nutmeg. Set over a slow fire, do not cook too hard; serve hot, on the plate on which they are cooked.

#### Cheese as Food.

Good cheese is very nutritious, even more so than eggs. Cheese varies wonderfully in its composition, but when properly made it contains about one-third water, one-third albuminous material, one-fourth fat and about five per cent. of mineral matter. One-half of a pound of good cheese contains as much nitrogenous matter as a pound of the best meat, and one-third of a pound as much fat as a pound of average meat. Old cheese, however, is not wholesome, and can not be eaten in large enough quantities to be useful as a food. Very new cheese, on the other hand, is less easy of digestion.

Cheese is difficult to keep in warm climates, and easily decays in all places unless properly cared for. Mouldy and decayed cheese is unwholesome and can always be told by the taste. American cheese is not so good as English and Swiss; still the best American cheese is very good. The English working classes use bread and cheese very largely as an article of diet. The Americans use it as a relish and luxury, but rarely as an article of nourishment. We believe Americans use too much meat. Those who wish for a substitute will find it in good eggs and cheese. With these foods they need rarely or never use meat at all.—*Herald of Health.*

**FLAKY AND SHORT CRUSTS.**—In making a flaky crust, a part of the fat should be worked with the hand to a cream, and then the whole of the flour well rubbed into it, before any water or milk be added. The remaining fat must be stuck on the paste, and be rolled out. For crisp crust, by far the most wholesome, the whole of the fat should be rubbed in thoroughly, incorporated with the flour. Water or milk must be added when this is done, and the dough, or rather paste, made up. The pie-board and rolling-pin should be well dusted with flour, and the dough should be well beaten with the pin, to thoroughly mix it and render it light. Mind, in rolling out paste, do not drive the pin backward and forward, but always keep rolling from you. In making flaky crusts, the paste must be rolled out thin, and the fat or butter laid all over it; then roll it up and beat it till it puffs up in little bladders; it should be then finally rolled out, and put in the oven as quickly as possible.

**ICING PASTRY.**—When nearly baked enough, take the pastry out of the oven, and sift fine powdered sugar over it. Replace in the oven, and hold over it, till the sugar is melted, a hot iron shovel. The above method is preferred for pastry to be eaten hot; for cold, heat up the whites of two eggs well, wash over the top of the pies with a brush, and sift over this a good coating of sugar; cause it to adhere to the egg and pie-crust; trundle over it a clean brush, dipped in water, till the sugar is all moistened. Bake again for about ten minutes.

**EAST INDIA PICKLE.**—Chop cabbage fine, leaving out the stalks, together with three or four onions, a root of horse-radish and a couple of green peppers to each cabbage. Soak the whole in salt and water for three or four days. Spice some vinegar with very strong mace, cloves, allspice and cinnamon. Heat it scalding hot. Add alum and salt, and turn it on the chopped pickles, which should previously have all the brine drained from them. In the course of three or four weeks the pickles will be fit for use.

**HOW TO EAT CORN.**—The operation of eating corn from the cob is much facilitated by drawing a sharp knife lengthwise of each row, in such a manner that the hull of each kernel will be split. When this is done the digestible nutritious contents of the kernels will slip out and the often tough hull be left upon the cob. Those whose teeth are sensitive or defective will find this a great help.

**TO KEEP FRUIT.**—The *Journal of Chemistry* has the following: Beat together equal measures of honey and spring water in an earthen vessel; put in your apricots, plums and peaches, freshly gathered; cover closely, and they will keep fresh for a year. When taken out for use they must be rinsed in cold water.

### Domestic Receipts.

**PUMPKIN PRESERVES.**—Cut a nice ripe pumpkin into pieces a third of an inch thick, paring them. Take equal weight in white sugar. Allow the juice of one lemon to a pound of pumpkin. Let the pumpkin remain in a pan with the sugar and juice all night. In the morning put into a preserving kettle, cooking till perfectly clear. Be sure to skim well. Then add lemon peel cut in pieces small as marbles. Take out and strain the syrup through a jelly-bag, and pour over the pumpkin.

**QUINCES DONE IN MOLASSES.**—Pare and quarter them, holling the skins and cores in new cider, and straining them. To five pounds of quince use one of brown sugar, one quart of molasses, and the cider in which you boiled the skins. Add the whites of two eggs, and clarify. When cool, add the quinces, and holl till tender, adding more cider if necessary. Spice with orange peel or ginger root.

**TO KEEP EGGS.**—Among the various methods proposed, none perhaps is better than the following:—Fill a kettle with water, and let it boil. Then fill a corn popper or something similar, with eggs, and immerse them in the water, now holding them in more than a second. Pack them in bran or paper rags, little end down, and they will be good when hens lay in the Spring. I have tried it three seasons, and never failed in laying down fresh eggs.

**GREEN TOMATO PICKLE.**—One peck of green tomatoes, one dozen onions. Slice and put in layers, with salt sprinkled over them, and let them stand until the next day, and then drain off the liquid. One hox of mustard (two gills), one and a half ounces of ground black pepper, one ounce of whole cloves, one ounce of yellow mustard seed, one ounce of allspice. Put the pickle in a kettle in layers with the spice and add vinegar enough to cover up all, first wetting the mustard, and let the whole boil twenty minutes. The same recipe is excellent made with half tomatoes and half green peppers, and when done and perfectly cold, one gill of olive oil.

**FRIED BREAD.**—Put into a common biscuit pan a heaping teaspoonful of butter, and let it melt and spread over the pan; then take enough slices of bread (stale answer as well as any) to cover the bottom of the pan, and make a mixture to dip them in by beating well with two eggs, and pouring in milk enough to soak the bread, season it with a little pepper and salt; make the bread quite moist; then lay it on the butter and fry brown one side, and if too soft to turn, put it into the oven to brown on the top, and you will have a dish that serves for meat and potatoes, consisting of neither.

### Mechanical Hints.

**HOW TO SELECT HINGES.**—The following simple method of selecting right from left-handed, loose jointed butts or hinges, may be useful to many, as it has often saved considerable trouble and annoyance in sending inexperienced persons to the stores for such articles: Take up the closed hinge from the counter and open it from you, holding it in both hands; if you wish for right-handed ones hold fast with the right hand, letting go with the left. If the hinge remain intact it is right-handed, but if it fall to pieces, or apart, it is left-handed. Holding fast with the left and letting go with the right, will prove which is which, by a similar test. I have seen many a score of people puzzled to tell one hinge from another, until I showed them the above simple plan, when it was a mystery no longer.

**RUST.**—Sometimes rust can be removed from polished iron or steel with little difficulty; but sometimes it cannot be made to disappear without polishing the surface anew. Rust is oxide of iron. The oxygen of the atmosphere unites with the iron chemically, thus forming a thin scale on the surface, not one-thousandth part of an inch in thickness. Red rust may be formed on the polished surface a thousand times without materially corroding the metal, provided it be removed soon after it has formed. The usual manner of removing red rust is to cover the rusty portion with common olive oil, and rub it in well with a woolen cloth. After it has stood a few hours, rub the parts with finely pulverized slacked lime, or Spanish whiting, until the rust is all removed. If red rust is allowed to accumulate until the polished surface is corroded, sweet oil and a severe rubbing will seldom remove it. The entire surface must be re-polished with emery, or some other grit, before black rust will disappear from polished steel or any other metal.

## LIFE THOUGHTS.

GIVE work rather than alms to the poor. The former drives out indolence, the latter industry.

POETRY is the flower of thought; sarcasm the needle; wit, the honey; and punning the small beer.

DESPISE not little sins, that have ruined many a soul. Despise not the little duties; they have been to many good discipline.

WE should watch over the interests of others as well as our own, and be careful to act on every occasion, with uprightness and fidelity.

BE not stingy of kind words and pleasing acts, for such are fragrant gifts, whose perfume will gladden the heart and sweeten the life of all who hear or receive them.

Does a man speak foolishly? Suffer him gladly, for you are wise. Does he speak erroneously? Stop such a man's mouth with sound words that cannot be gained. Does he speak truly? Rejoice in the truth.

MEMORY presides over the past; action presides over the present. The first is a rich temple hung with glorious trophies and lined with tombs; the other has no shrine but duty, and it walks the earth like a spirit.

THE same vanity which leads us to assign our misfortune or conduct to others, prompts us to attribute all lucky chances to our own talent, prudence and forethought.

If you want to find out a man's real disposition, take him when he is wet and hungry. If he is amiable then, dry him and fill him up, and you've got the greatest wonder of the century.

A Good man who has seen much of the world and is not tired of it says: "The grand essentials to happiness are something to do, something to love, and something to hope for."

EDUCATION is a better safe guard of liberty than a standing army. If we renege the wages of the school-master, we must raise those of the recruiting sergeant.—*Everett.*

### Who is Old.

A wise man will never rust out. As long as he can move or breathe he will be doing for himself, for his neighbor, or for posterity. Almost to the last hour of his life, Washington was at work, so were Young and Howard and Newton. The vigor of their lives never decayed. No rust marred their spirits. It is a foolish idea to suppose that we must lie down and die because we are old. Who is old? Not the man of energy, not the day laborer in science, art or benevolence; but he only who suffers his energies to waste away and the springs of life to become motionless; on whose hands the hours drag heavily, and to whom all things wear the garb of gloom. If he old, should not be asked; but is he active?—can he breathe freely and move with agility? There are scores of gray-headed men we should prefer, in any important enterprise to those young men who fear and tremble at approaching shadows, and turn pale at a lion in their path, at a harsh word or a frown.

**FORMATION OF CHARACTER.**—Have you noticed an icicle how it froze one drop at a time, until it was a foot long or more. If the water was muddy, the icicle looked foul and its beauty was spoiled. Just so our characters are forming. One little thought or feeling at a time adds influence. If thought be pure and right, the soul will be lovely, and will sparkle with happiness, but if impure and wrong, there will be final deformity and wretchedness.

**SECRET SORROWS.**—In the lives of the saddest of us there are bright days when we feel as if we could take the great world in our arms. Then come gloomy hours, when the fire will not burn on our hearths, and all without and within is dismal, cold and dark. Believe me every heart has its secret sorrows, which the world knows not of, and oftentimes we call a man a cold man, when he is only sad.—*Longfellow.*

BLESSED is the man who never runs in debt. Better deny yourself than to meet a man who looks at you every time he meets you with a countenance that says "Pay me what you owe me, sir." He is a happy man who can face the world and say "I owe you not a cent."

LET us never meddle with strife, if we can help it, and let us have as little to do as we can with the angry and furious, but let us always stand by the right, and let our silence, if not words, rebuke all wrong-doers.

## Business Cards.

**STEPHENS & CO.,**

MANUFACTURERS OF

**U. S. STANDARD BOXWOOD AND**  
**IVORY RULES.**

ALSO EXCLUSIVE MANUFACTURERS OF

**L. C. Stephens' Patent Combination Rule.**

This cut represents the COMBINATION RULE, which  
comprises a Foot Rule, Spirit Level, Try Square, Bevel,  
Plumb, Slope Level, Etc.

It is made of the very best quality of Turkey Boxwood,  
heavily bound with brass, and is graduated with mathe-  
matical accuracy.

The Square is adjustable, and can be tested and made  
perfectly true by the aid of a small screw-driver, but  
this is seldom required.

In its application as a Slope Level it is especially  
adapted for Miners' use, as it shows the pitch to the  
foot, and DEGREE OF INCLINATION at once. It is six  
inches long when folded, by one and three-eighths wide,  
and three-eighths inches thick, the cut being just one-  
fourth size.

"By the use of one of these, a builder, mason, car-  
penter, or other workman, can always have in his pocket  
the most valuable of his apparatus used in construction,  
combined in a portable, useful and cheap form."—Scientific  
American.

Price by mail, prepaid, \$4. For agents' terms, address

## PARASITIC WORMS IN THE WIND-PIPE OF FARM STOCK.

Some time since we published a letter from a gentleman, who complained that his young cattle were dying, and that the apparent cause of death was found in some small worms, which occupied the air passages of each one of the victims. Our correspondent wished to know what the worm was, and what he could do to prevent its ravages. We think that we can now answer his questions, although we fear not quite to his satisfaction, as but little encouragement can be given to those who have cattle infected with these parasites, and hope to cure them.

The worm is probably the same species that has been causing serious mischief among the herds of New York during the past season. Many young cattle have died there with the symptoms of pneumonia, at a time of the year when that disease was not to be expected. A *post-mortem* examination showed, as in the case of the cattle belonging to our correspondent, that the inflammation of the air passages was caused by parasitic worms. Some of the worms were preserved in alcohol, and sent for examination to Prof. A. E. Verrill of the Sheffield Scientific School of Yale College. We were in New Haven at the time, and the Professor showed us the specimens, which appeared much like bits of horse-hair, an inch or so in length.

Prof. Verrill is an enthusiast in Zoology, and has spent much time in studying animal parasites. Probably there is no other man in America that understands the subject so well. In 1870 he delivered a course of lectures before the Connecticut Board of Agriculture which were published in the report of that body, and also in pamphlet form, under the title of "The External and Internal Parasites of Man and Domestic Animals."

The Worm Under Discussion is known among scientific men by the name of *Strongylus micrurus*, and is but one of several closely related species coming under the genus *Strongylus*, as will be seen from the following descriptions which are taken in an abbreviated form from the work mentioned above, as is also our figure, which represents the species known as *S. Filaria*.

### Strongylus.

The genus *Strongylus* includes slender, filiform worms, mostly of small size, and often reddish in color. Several of them live in the windpipe and bronchial tubes of various animals, including sheep, deer, cattle, pigs, etc., and when numerous may occasion the death of the animals that they infest, by suffocation.

The body generally tapers toward the head, and sometimes in both directions. The mouth is small, situated at the end of the small head, which is either simple or with lateral expansions. It is sometimes surrounded by small papillae, but is often simple, and either round or triangular, but not enclosed by a hard organ as in some other worms. The oesophagus is enlarged, club-shaped, and muscular.

The male has the posterior portion of the body expanded. (See figure)

### The Strongylus of Sheep.

*Strongylus Filaria Rudolphi*. The present species is whitish, very long and slender. The head is obtuse and without appendages, the mouth surrounded by three small papillae. The caudal pouch of the male is entire, with ten rays. (See figure).

The male is about two and a half inches long, the female sometimes three and a half, though generally not more than two or three inches long. The interior of the body of the female is mostly occupied by two long, convoluted tubes, containing eggs in which the embryos are in all stages of development.

### Habits.

This species live in the lungs, air-passages, and bronchial tubes of sheep and other ruminants. They often occur singly or several together, in cavities in the substance of the lungs, producing great inflammation and destruction of the tissue, which often results in the death of a great number of lambs, and greatly injures the health of old sheep, even if it does not actually kill them.

In this way many thousands of lambs are annually lost in England. In this country we have far less information concerning its ravages, but have no reason to suppose that it is less common than in Europe, in localities that are favorable to its development. Sheep infested by this parasite continually cough up the eggs and embryos of the worms. These often adhere to grass or other herbage and may thus be swallowed by other sheep or lambs, and pass directly into the windpipe, or else do so when the cud is raised for mastication. Therefore lambs should never be put into fields or pastures where diseased animals have been kept, but such infected lands should be tilled, or at least left at rest for several months. As soon as an animal gives any indication of the presence of the parasites, by the peculiar cough, it should be separated from the rest of the flock for treatment, or else immediately killed, and the parasites should be destroyed, and not thrown on the ground as harmless, for all these worms are remarkably tenacious of life, and often may even be dried up completely for months, and then revive when moistened.

### Remedies.

When these parasites are once lodged, in numbers, in the substance of the lungs, there is probably no reliable remedy whatever. When merely in the windpipe and bronchial tubes, expectorant medicines that will produce a copious secretion of mucous may be useful. It might be possible to remove them by a surgical operation, opening the windpipe from the exterior, but this would require surgical skill, and would not pay, perhaps, except as a last resort for valuable animals.

The *Strongylus* of Cattle and Horses. (*Strongylus Micrurus Melhis*.)

This species closely resemble the preceding. The male grows to the length of about one inch and a half, and the female to three inches or a little more. The body is very slender with a simple, blunt head. The caudal pouch of the male has five rays (an important characteristic for distinguishing from *S. Filaria*). It is said to be viviparous.

The habits of this species are nearly the same as those of the last, except that this inhabits the air-passages of cattle, horses, asses, and mules, instead of sheep. It is

much more liable, like the former, to infect young animals than adults. Calves less than a year old are particularly liable to be invaded, and those that are once attacked seldom or never recover. The same remarks, concerning the means of prevention, made under the preceding species, will apply equally to this. If neglected, these parasites increase with great rapidity, and thus the disease which they cause appears like an epidemic, in certain localities destroying hundreds or thousands of animals, while adjacent farms may be entirely free from it.

The Professor goes on to describe four other species of *Strongylus*, one of which inhabits the air-passages of the hog, another the intestines of the same animal, two, the intestines of sheep, and one, the intestines of cattle.

The whole subject of animal parasites is of the greatest importance, and too little understood by farmers and physicians. We hope that our readers will make notes of such cases as may come under their observation, and report to us, with full particulars as to modes of occurrence, amount of mischief, etc. We should be glad to receive alcoholic specimens, securely put up in small bottles, as we have facilities for having them identified in most cases. Some common and destructive parasites are easily destroyed, and we shall be glad to give such information as may be within our reach.

FARMERS' CREDIT.—The Sacramento Savings Bank has loaned \$118,000 on Solano and Yolo farming lands.

## NOTICES OF RECENT PATENTS.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

PRUNING SHEARS.—John F. Creighton, Placerville, Cal. This invention relates to that class of pruning and picking shears, in which a spring or yielding holder is employed in connection with the shears for the purpose of seizing the severed limb or twig and preventing it from falling to the ground after it is cut off. The improvement consists in the employment of a supplementary punching tool, which is secured to one side of the shears so that it will be operated in unison with the cutting jaws of the shears and by the shear handles, so as to pinch or grasp the secured twig or limb at the same time that the shear blades cut it.

IMPROVEMENT IN THE CONSTRUCTION OF VESSELS.—Adam Wingard, S. F., Cal. The object of this invention is to provide certain improvements in the construction of the hulls of sea-going and river vessels in order to admit of their attaining a high rate of speed, and at the same time preserve the harmony of outline, with great carrying capacity.

The scow or flat bottom is employed to give the advantage of a high rate of speed, and the defects of this construction are remedied by a peculiar construction of the stem and stern which are formed into two cutwaters or prows, and two sterns so that with great width, fine lines are preserved where the vessel enters and leaves the water.

REVOLVING DIE FOR CUTTING SCREWS.—John Carroll, Oakland, Cal., assignor to self and Chas. Wilkinson of same place.

The object of this invention is to provide a die for cutting screws, which by being made revolving in a case, can be instantly adjusted for any one of a series of different sizes, such as are used for gas-fitting, for which the invention will be found particularly applicable. The device consists of a hollow case of metal, in the form of a short cylinder, having two sockets for levers in opposite sides; within this case is a short hollow steel cylinder, the sides of which are pierced with as many holes as are convenient for the introduction of different sizes of pipe, and these holes serve as guides to the dies for each size, which are situated opposite to their respective openings, and are formed in the same cylinder. Holes are made through the outer case, and any sized die can be brought opposite the holes for use. For the two largest sizes, the dies are placed in the axis of the die cylinder, and have suitable guides.

### New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

GOLDEN CHARIOT GRAVEL MINING CO.—Trustees: U. P. Sheldon, H. H. Welch and H. P. Burnham. Capital stock, \$1,200,000 in 24,000 shares.

SAN JUAN DEL RIO MINING CO.—Capital stock, \$4,800,000 in 48,000 shares. Trustees: J. W. Dwinelle, E. L. Gould, J. O. Farrell, C. W. Cook and J. E. Magee.

MEADOW VALLEY EAST EXTENSION MINING CO. Capital stock, \$3,500,000 in 35,000 shares. Trustees: D. W. Connelly, M. Skelly, O. Hoffman, W. Burling and F. L. A. Pioche.

ELY CONS. MINING CO.—Capital stock, \$3,500,000 in 35,000 shares. Trustees: D. W. Connelly, H. A. Lyons, M. Skelly, C. D. O'Sullivan and O. Hoffman.

FROM BANTA'S TO ANTIOCH.—The C. P. R. R. Company have entered in earnest upon building a railroad from Banta's Station to Antioch City. A contract has already been let for grading the first fifty miles of the distance. This road is to run by the way of the Antioch and Martinez to Oakland, over which the company will carry their freight and perhaps passengers also and thus avoid the heavy grade of the Livermore Pass. That portion of it from Martinez to Oakland will answer for the continuation of the California Pacific when the Straits of Carquinez shall be bridged or a ferry used to carry the overland people by the short route direct to Oakland, or it may be to San Francisco when the Bay shall be bridged also—as it will doubtless be in time. The distance from Oakland to Banta's is about the same as per Livermore Pass, while it can be run much quicker and operated at far less cost.

## AN INVENTOR'S OPINION.

SACRAMENTO, Oct. 7, 1871.—Messrs. DEWEY & Co.—Dear Sirs: My patent for casting Aluminum Dental Plates came duly to hand. It seems to me to be complete in all its parts. In view of the fact that there are already about five patents for casting this metal into Dental Plates, I think the case has been well handled. For this and for your forbearance in my over anxiety, receive my hearty thanks. F. M. SHIELDS.

AN EXTENDED POPULARITY.—"BROWN'S BRONCHIAL TROCHES" have been before the public many years. Each year finds them in new localities in various parts of the world. The Troches are pronounced universally superior to all other articles used for similar purposes. For relieving Coughs, Colds, and Throat Diseases, the Troches have been proved reliable.

## ACTIVE MEN!

With Experience in Canvassing business, can now obtain lucrative and permanent employment by DEWEY & CO., Patent Agents and Publishers of the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS, No. 414 Clay street, S. F.

## A Novelty Printing Press for Sale.

It is a new foot-power Press, and just the thing for a small country job office or for amateur printers, and druggists and others who wish to do their own printing. At manufacturers' price, with freight added. Enquire at this office. 11/24tr-lams

## Store or Shop Room to Let IN GRAND HOTEL.

Also, a BASEMENT. Inquire at 17 New Montgomery street. WIESTER & CO.

## Longshore's Combination Tool.

This device is just what its name indicates. As a KITCHEN TOOL it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pincers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

### WIESTER & CO.,

17 New Montgomery street (Grand Hotel), SAN FRANCISCO.

## AMMONIACAL PREPARATION

—FOR THE—

## Prevention and Removal of Boiler Scale.

MANUFACTURED BY THE

San Francisco Gas Company.

F. I. CURRY, Sole Agent, San Francisco Boiler Works, 123 and 125 Beale street, San Francisco.

This Preparation is proved by the experience of many of our best machinists and engineers to be a perfect cure for the vexatious and dangerous incrustation known as Boiler Scale. It is sold in 5-gallon cans at \$5.25 per can, or in case of two cans each at \$10.50 per case.

The San Francisco Gas Company also manufactures

Carbonate of Ammonia.

Muriate of Ammonia.

Sulphate of Ammonia.

Liquor Ammonia, Concentrated.

Aqua Ammonia, F. F. F.

Concentrated Crude Ammonia, for Ice Making and other manufacturing purposes.

9v23-3m

## The California Powder Works

No. 314 CALIFORNIA STREET.

SAN FRANCISCO.

Manufacturers and have constantly on hand

## SPORTING,

## MINING,

## And BLASTING

## POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

## Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

## HERCULES POWDER,

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING powder, thus making it vastly superior to any other powder now in use.

A circular containing a full description of this Powder can be obtained on application to our Office. 16v20-3m JOHN F. LOISE, Secretary.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Bellevue Mining Company—Location of works, Ophir District, Placer County, California.

Notice. There are delinquent upon the following described stock, on account of assessment levied on the 13th day of August, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the 13th day of August, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, 409 California street, San Francisco, Cal., on the 23d day of October, 1871, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, 409 California street (up stairs), San Francisco, Cal. oct-13w

Highland Silver Mining Company—Location of works, Railroad District, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 9th day of October, 1871, an assessment of two dollars and fifty cents (\$2.50) per share was levied upon the capital stock of said company, payable immediately, in United States coin, to the Secretary, at No. 28, Merchants' Exchange, San Francisco, California. Any stock upon which said assessment remains unpaid on the 13th day of November, 1871, will be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, No. 28 Merchants' Exchange, California street, San Francisco, Cal. oct-14w

Kincaid Flat Mining Company—Location of works, Toiyabe County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 11th day of October, 1871, an assessment of two dollars and fifty cents (\$2.50) per share was levied upon the capital stock of said company, payable immediately, in U. S. gold and silver coin, to the Secretary, at No. 28, Merchants' Exchange, San Francisco, California. Any stock upon which said assessment remains unpaid on the 13th day of November, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, 220 Clay street, San Francisco. oct-14w

Nevada Land and Mining Company—Location of works, Spruce Mountain, Antelope and Clifton Districts, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 12th day of October, 1871, an assessment of four (4) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, room 302 Montgomery street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Saturday, the 11th day of November, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, Room 5, No. 302 Montgomery street, San Francisco, California. oct-14w

Noonday Silver Mining Company—Location of works, White Pine Mining District, White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 4th day of October, 1871, an assessment of twenty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary of the company, Room 2, Express Building, northeast corner of California and Montgomery streets, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Wednesday, the 8th day of November, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 27th day of November, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, Room 2, Express Building, northeast corner of California and Montgomery streets, San Francisco, Cal. oct-14w

Piermont Milling and Mining Company—Location of works, Piermont Mining District, White Pine County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the fourth (4th) day of September, A. D. 1871, an assessment (No. 1) of one dollar and twenty-five cents per share was levied on the capital stock of said company, payable immediately, in U. S. gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco. Any stock upon which said assessment shall remain unpaid on Monday, the 8th day of October, A. D. 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 20th day of November, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, Room 2, Express Building, northeast corner of California and Montgomery streets, San Francisco, Cal. oct-14w

POSTPONEMENT.—The day for deemed stock delinquent on the above assessment is hereby postponed until Thursday, the 9th day of November, A. D. 1871, and the sale thereof, until Friday, the 10th day of December, A. D. 1871. By order of the Board of Trustees.

Office, Room 2, Express Building, northeast corner of California and Montgomery streets, San Francisco, Cal. oct-14w

Pocahontas Gold Mining Company—Location of works, Mud Springs, El Dorado County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 18th day of September, 1871, an assessment of three dollars (\$3) per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 419 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 28th day of October, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 27th day of November, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, Room No. 26, 419 California street, San Francisco, California. oct-23-1d

KNOWLES' PATENT STEAM PUMP.

Awarded First Premium and Diploma

Over all Competitors, at Mechanics' Institute Fair of San Francisco, 1871; also Special Premium and Diploma at State Fair, and Gold Medal Recommended.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.

The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.

The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rings or a patent fibrous head, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purposes, are got at immediately without removing any nuts or bolts.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, Cal., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have sixteen of them in use on this road for fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other.

Yours truly, A. J. STEVENS, General Master Mechanic.

OFFICE OF PEOPLE'S TRANSPORTATION CO., PORTLAND, Oregon, April 22, 1871.

Mr. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order per steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider them the best steam pump now in use. They are economical and simple in construction, do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best Pump in use.

Yours respectfully, G. MARSHALL, Chief Engineer.

OFFICE OF N. Y. CENTRAL R. R., ALBANY, June 3, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: Yours of 31st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.

Yours very truly, C. P. HARM.

OFFICE OF DELAMATER IRON WORKS, NEW YORK, May 26, 1871.

Messrs. KNOWLES & SIBLEY, 92 Liberty street—Gentlemen: In reply to your inquiry as to my opinion of your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.

Yours very truly, GEORGE M. REYNOLDS, Supt. Engineer.

U. S. NAVY YARD, New York, June 3, 1871.

Messrs. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.

Yours very respectfully, WM. W. WOOD.

OFFICE OF THOMAS IRON WORKS, HOKENDAUQUA, Pa., June 1, 1871.

Messrs. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of a great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we have had in use now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, which to say the least are equal to the best we have tried. I cheerfully recommend "The Knowles Pump" to any who may have use for a first-rate Steam Pump.

Respectfully yours, etc., EDWIN MICKLEY, Supt. of Mines.

OFFICE OF THE SAUCON IRON CO., HELLENSTOWN, Northampton County, Pa., May 26, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: We can most cheerfully respond to your inquiry as to the qualities of the Knowles Patent Steam Pumps we have in use. We bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnace and at the mines working in clear and muddy water, and have put them to severe tests. And we can say that they have given VERY GREAT satisfaction, and that we like them better than any we have ever used.

Yours very respectfully, G. W. WHITAKER, President and Superintendent.

OFFICE OF NEW HAVEN WATER CO., Dec. 18, 1869.

Messrs. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 18-inch dia. steam cyls., 12-inch dia. water cyl., and 24-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of coal of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.

Yours very truly, P. SAULT, Superintendent.

OFFICE OF RED BLUFF WATER WORKS, Red Bluff, June 11, 1871.

A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working now four months, and has given entire satisfaction; and I take great pleasure in recommending them to be all you have claimed for them, and I will add that I think they have no equal. Yours, etc., JOHN CLEMENTS, Engineer.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD,

And for Every Conceivable Purpose.

Silver Sprout Mining Company—Location of works and mine, Kearsarge District, Inyo County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of September, 1871, an assessment of twenty-five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No 318 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 13th day of November, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Under a Burning Sun, where Bilious affections and Fevers of various descriptions so generally prevail,

Tarrant's Effervescent Seltzer Aperient has been successful beyond all parallel. Hence the physicians of the tropics give it their emphatic sanction, prescribing it in preference to every other aperient in use. The patients, of course, gladly acquiesce, for this preparation is one of the most delightful, as well as mild and cooling cathartics, chemistry has yet devised, and possesses every medical virtue of the far-famed German Seltzer Spa. It is a powder that only requires the addition of water to produce in an instant a delicious effervescent beverage, as well as an invaluable medicine. Ask for and accept none but the genuine.

SOLD BY ALL DRUGGISTS.

## WHY THE WILSON

## Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

## THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

## IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill,

## RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

## DO NOT BE DECEIVED

by the cry of "Humbly," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation. For further particulars address

FURMAN R. WILSON,

San Francisco.

## GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION:—D, is a glass chamber which contains the lubricant. O is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted siphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the ejection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and O. fel8-tf

24v22-3m **JOSEPH MOORE,** Superintendent

# STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

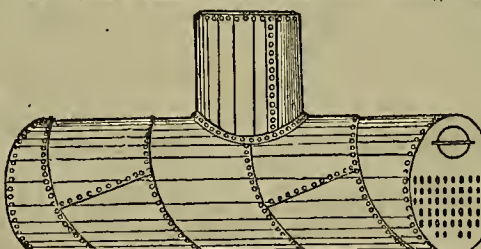

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation.

**Varney's Patent Amalgamator.**  
These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

## To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

### To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., SCIENTIFIC PRESS OFFICE SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS 112 illustrated mechanical movements and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAWS of 1870.

CELEBRATED

## Worcestershire Sauce.

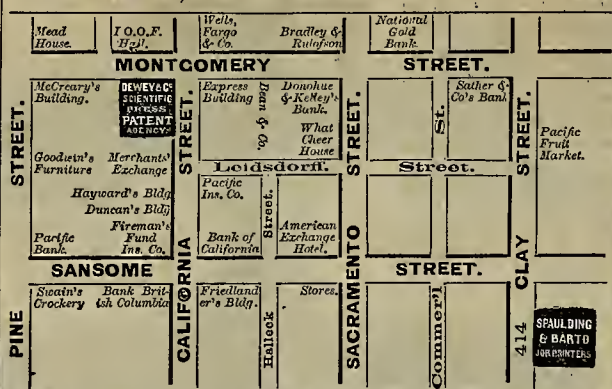

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper. Wholesale and for export by the Proprietors, Worcester; Croese and Blackwell, London, &c., &c., and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1722-lysox

# SCIENTIFIC PRESS.

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,  
**Mining, Mechanic Arts and Inventions.**

BY DEWEY & CO.,  
Patent Solicitors.

SAN FRANCISCO, SATURDAY, OCTOBER 28, 1871.

VOLUME XXIII.  
Number 17.

## Mining Map of Utah.

We present, to-day, for the benefit of our numerous readers in the mining sections a map of Salt Lake and vicinity, with the dimensions and location of twenty-eight different organized mining districts, steamboat and railroad routes, creeks and rivers, compiled from Froiseth's map, which was made up from the latest United States Surveys and other authentic sources. This map is a very comprehensive one, showing as it does the location of so many mining districts, and will be found convenient for reference in connection with our "mining summary," from week to week, and the numerous paragraphs going the rounds of the press concerning the wonderful extent and richness of the deposits found in the different sections here depicted.

The vast mineral resources of Utah Territory, which are now being developed and which may be said to be yet only in their infancy, are even now world-famous. Gold, silver, argentiferous galena, quicksilver, copper and manganese have already been discovered; the deposits of galena equalling, if not surpassing, anything ever before found. The attention of English as well as home capitalists have been called to these mines, and even now the statistics of the amount of bullion shipped from these districts at such an early stage of their development are such as to astonish us. The business of mining, far from being on the wane among the States and Territories of the Pacific Coast, is just beginning to be considered a legitimate investment, and one which will be permanent.

**SUIT FOR MINING GROUND IN ARIZONA.**—An action has been brought in the 4th District Court against E. J. Cooke and the Tiger Silver Mining Co., in Yavapai County, Arizona, by Wm. B. Fleeson. The complaint alleges that the plaintiff and H. M. Curry entered into partnership in 1869, and that Curry was to go prospecting while Fleeson provided the outfit, all interests to be equally divided. Curry after receiving \$290 went to Arizona and located with other parties, 1,200 feet of ground known as the Tiger lode. Curry acquired 240 feet but conveyed only 62½ feet to plaintiff, and afterwards, without consideration deeded to E. J. Cooke all his interest, including 57½ feet belonging to plaintiff. Cooke conveyed this interest to the Tiger Silver Mining Co. Fleeson demands judgment for 1,150 shares of stock, which is worth now about \$5 per share.

**TELEGRAPHIC EXTENSION TO PIOCHE.**—The Deseret Telegraph company have extended their lines to Pioche City, connecting at Salt Lake City with the Western Union Telegraph Company, placing the Eastern Nevada mining districts in communication with San Francisco.

**ELEVEN** hundred tons of borax are consumed in the world annually.

## Important Mining Suit.

An important mining suit has been brought in the Twelfth District Court by Wm. H. Sears against the Pioche Silver Mining Co. The complaint alleges that the plaintiff was, and still is, the owner of

alleged that the company obtained \$20,000 from the mine. Plaintiff says Sanderson has given him the right of action against the defendant to recover this sum, Kitterman, the original owner, sold to Sanderson on the 6th of September. In 1864 the defendants entered upon this ground to the

## Tin in Utah.

If reports from Salt Lake are correct, the tin mines at Ogden are likely to prove extensive and profitable. It is said that the ore in the Star of the West—the pioneer discovery—will average twenty-five per cent. in tin. As we are totally dependent on Europe for our supplies of this useful article, the discovery of these mines is of the utmost importance. The principal tin mines in the world are in Cornwall, England, which have been worked uninterruptedly from the earliest historic periods. The metal is found in small quantities in Spain, Saxony, Austria, Siberia, France, Bohemia, Australia, Burmah, Madagascar, Mexico, the island of Borneo, in Southern Asia, and in several of the South American States. In the United States very little has been found, and that in Massachusetts, New Hampshire, New York, Virginia, and New Jersey. It has also been discovered in several different localities in the southern portion of California, but the deposits are limited in extent and value, and the production never exceeded, as far as we know, more than a few specimen bars. The extensive deposits of ore said to have been found in Utah will make a great difference in the consumption of this article and will revolutionize the entire trade. One of the claims taken up is said to have been bonded on mere prospective profit for the sum of \$200,000, a fact that speaks for itself in connection with the value of the discovery.

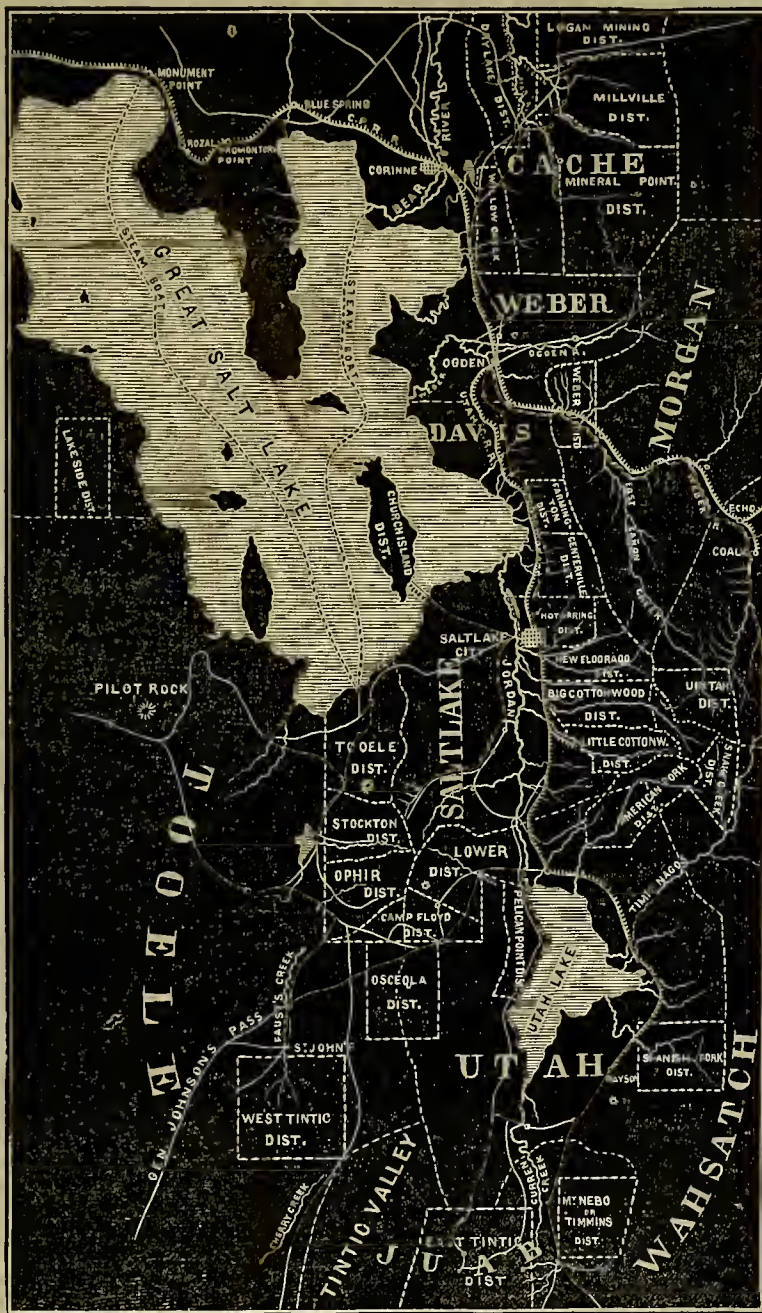

If the mines in question are as rich and extensive as they are said to be, we may expect to see some early developments, which will not only be productive of a rich harvest to the owners but to the general public.

**WIRE SILVER.**—We were shown to-day, some fine specimens of wire silver from the Bellevue mine, Placer county. The existence of wire silver in gold-bearing quartz in this country is something unusual and peculiar as well as interesting. The mine itself is achieving an enviable reputation.

**RALESTONITE** is the name of a new mineral recently discovered in Greenland. The crystals are octahedral, and are often colorless, sometimes approximating to whiteness; hardness, 4.5; specific gravity, 2.4. It is a hydrous fluoride of aluminum, characterized by distinct traces of calcium and soda.

The evidence of the spectroscope, as it stands, is certainly favorable to the idea that the constitution of the sun is not very different from that of the earth; a vast series of observations are required before this can be determined.

**NOTICE TO AGENT.**—Failing to inform us where to address him by mail, we have to adopt this manner of notifying T. W. Drullard to immediately discontinue canvassing for this office. He was last heard from in Plumas county.

MAP OF THE MINING DISTRICTS OF UTAH.

400 feet of stock in the Kitterman ledge, Ely District, Nevada, and that on the 5th inst., the defendant entered upon possession of the ground and from that time to the present has extracted and carried away ore valued at \$10,000. That on the 6th of September, David Sanderson owned the ground in question and transferred his claim to plaintiff, and since that date it is

damage of Kitterman to the amount of \$70,000—value of ore extracted; Kitterman has also given the plaintiff right of action, and an ejectment suit has been instituted at Pioche. Plaintiff prays for judgment for the gross amount, \$100,000.

**SOHRELE**, a Swedish chemist, discovered chlorine gas in the year 1774.

## MECHANICAL PROGRESS.

### Floors for Workshops, Etc.

Mr. Coleman Sellers, writes to the *Journal of the Franklin Institute* as follows:—Ground floors for large machine shops are very often made with the plank resting on the surface of the ground, the sleepers to which they are spiked being imbedded in the ground. I have been informed that white pine planks last longer than oak for the same purpose, and it is in fact considered the best wood for the purpose. Some attempts have been made to prevent the decay of such floors, but the question has at once arisen as to the economy in each case. Floors where heavy machinery is erected are subject to very severe wear, and it is asserted that a two-inch white pine floor will wear through in such a place before it has rotted out.

On the line of the Georgia Central Railroad floors have been laid in a peculiar manner, which is deserving of note. The ground is levelled off for the floor, and ditches dug to receive the string-pieces or joists; these are coated with melted rosin, before being laid, on the three sides in contact with the ground. The floor is then laid, with a space of half an inch between the surface of the ground and the under side of the floor planks. After the floor is all down, holes are bored, at intervals of say three feet, over the whole surface, and melted rosin poured into the space below the floor, to entirely separate the planks from the ground. The President of that road, says that floors so laid show no signs of decay, after many years use, in places where the floors usually rotted out in a short time. The asphalt pavement was adopted in one large shop in this city, but I have not heard how it has stood the test of wear. It was made of spawls from granite mixed with coal tar and asphalt.

In connection with the decay of floors it may be well to note that reliable builders state that on outside walls the ground floor joists are likely to rot off in about fourteen to fifteen years. My attention was called to this by the sinking of the floors in two houses in West Philadelphia, which had been built about fifteen years. An examination of the case showed that all the joists which had so rotted had been built into the wall at the ends, and the rot had occurred where the timber was excluded from the air and submitted to the moisture of the outside walls.

Examining houses in the country which have been erected for at least fifty years, I find the joists still sound, but in no instance have I observed the practice followed of carrying up the cellar wall flush between the joists, as is now the custom in cities. It seems evident that the best plan is to make an offset in the cellar wall to receive the joists, and, if the space between the joists is to be filled up for the looks, to let the filling in fall back of the face of the wall, below the joists, say one or two inches.

**COMBINED RUBBER AND COPPER WIRE FOR PIPE COUPLINGS.**—Mr. Fredrick Kibler of Baltimore, Maryland, has patented an improved joint for water pipes, steam pipes and steam chests, around bolts and other places, whether the joint be round, square, or of any other shape, which is claimed to be simple in construction and reliable and effective in use; it consists in a rubber or equivalent plate and copper wire for forming the joint. The plate made of rubber or other suitable material, is cut to fit between the faces that form the joint. Upon the plate is placed a copper wire, bent into a form corresponding with the hole or opening around which the joint is formed. The copper wire, which forms the real joint, should be one size larger than the thickness of the rubber plate, so that it may be flattened down between the faces of the joint, and may thus make the joint more perfect. This construction enables the wire to be arranged upon the rubber plate as may be desired, or so as to avoid flaws or imperfections in the plates or faces between which the joint is formed. If desired, two rubber plates may be used, with the copper wire placed between them.

**A NEW PRINCIPLE IN SEWING MACHINES.** Something entirely new has just been introduced to the public, in New York, and was exhibited for the first time on Thursday evening, at the Fair of the American Institute. It consists in making the shuttle stitch from two ordinary spools of thread without rewinding, and is certainly a very great improvement in the sewing

machine line. This has often been attempted, and a great deal of money has been expended in trying to accomplish it, but until now it has not been a success. It is claimed to be the greatest improvement made in this line since the needle and shuttle introduced by Howe, and the drop-feed by A. B. Wilson. Its value is testified to by a large number of people who have examined it at the Fair.

Patents have been secured in this country and Europe, and it is in the hands of a very strong and wealthy company, which numbers among its Directors some of our wealthiest men, and the invention will soon be placed before the public.

**THE WASHING OF CANAL BANKS.**—The Iron Age, in noticing the proposition of Mr. Myers to clothe the sides of the banks of canals with iron plates, an eighth of an inch in thickness, securely fastened, and suspended about equally above and below the water line, to prevent injury to the banks from the wash of passing boats, and the device says it would be a very good one if there were any serious wash to obviate. As it is, however, the invention is designed to meet an imaginary necessity, so far as the Erie Canal is concerned.

It may be, adds the *Age*, that, on some canals, the banks are injured by the wash of which we hear so much, although we have never seen an instance in which such was the case; but the Erie and other New York State canals suffer no such damage, nor is it either necessary or desirable to take the banks into consideration in seeking a solution of the question of steam navigation. This is a mistake which inventors persist in making, notwithstanding the assurance of the Canal Commissioners and the Commissioners of the State bounty, that no possible injury can be done to the banks by any system of propulsion which is mechanically adapted to the business of the canals. If this could be impressed upon the minds of those who are designing and building steam canal boats, many of the imaginary difficulties would disappear, and inventors would be saved the trouble and expense of making costly and useless experiments. If sufficient power is provided for economical traction, the banks will take care of themselves. The above facts with regard to the washing of canal banks, will be new to most of our readers; but they are no doubt correct.

**TESTING SILVERY COATING OF METALS.**—It is sometimes a matter of interest to be able to determine, by means of a simple test, the nature of a silvery coating to a metal, whether it be pure silver or some other substance. This is said to be readily accomplished by the use of a cold saturated solution of bichromate of potash in pure nitric acid, of one and two-tenths specific gravity. The surface of the article to be tested is to be first washed with strong alcohol, so as to remove any lacquering, and then a drop of the solution applied by means of a glass rod, the place affected being immediately rinsed off with water. If the substance in question be silver a distinct blood-red spot of chromate of silver will be perceived. The spot is brown on German silver, and after rinsing shows no trace of red. With Britannia (composed of tin, antimony and a little copper), a black spot will be developed, but no effect will be seen with platinum. Upon a surface amalgamated with mercury a reddish-brown deposit will be perceived, which is completely washed away on rinsing. With lead and bismuth a yellow deposit remains. Zinc becomes strongly etched, the liquid, however, disappearing completely on washing. Tin is attacked also very decidedly, but the test liquid imparts a brownish color, and an addition of water produces a yellow deposit which readily attaches itself to the metal.

**WIRE SURFACE FOR PLASTERING.**—The most ingenious device has recently been patented by Mr. Jas. Johns, of Chicago, in the use of wire in forming a plastering surface. The plan consists not in the use of any wire net-work expressly manufactured for the purpose, as might be supposed, but simply in the fastening of ordinary wire upon the posts, in place of lath. The wire is passed from a reel and drawn tightly in parallel horizontal lines about half an inch apart. It is attached to the standards by means of two narrow strips of iron, one of which is nailed to the post, and another fastened in the same manner upon the first, the wires being held at equal distances apart between the iron strips. It would naturally be supposed that plastering applied upon this wire would pass largely through, and fall off, but this does not prove the case, and the result of the device is a solid wall of plaster, through the middle of which the wires extend, holding it firmly.

## SCIENTIFIC PROGRESS.

### The Nature of Comets.

Sir William Thompson, in his late address before the British Association, at Edinburgh, referred substantially as follows to some late speculations with regard to the nature of comets: Most important steps have been recently made toward the discovery of the nature of comets. One of the theories is that they consist of groups of meteoric stones. In 1866, Schiaparelli calculated from observations on the August meteors, an orbit for these bodies which he found to agree almost perfectly with the orbit of the great comet of 1862. \* \* \* The densest part of the train, when near enough to us, is visible as the head of the comet, which is self-luminous in its nucleus, on account of collisions among its constituents, while its "tail" is merely a portion of the less dense part of the train illuminated by sunlight, and visible or invisible to us according to circumstances, not only of density, degree of illumination, and nearness, but also of tactic arrangement, as of a flock of birds or the edge of a cloud of tobacco smoke.

One of the most serious objections to the above theory is hinted at as follows: "In no respect is the question as to the materiality of the tail more forcibly pressed on us for consideration than in that of the enormous sweep which it makes round the Sun in *perihelion* in a manner of a straight and rigid rod, in defiance of the law of gravitation." "The projection of this ray, to so enormous a length, in a single day, conveys an impression of the intensity of the forces acting to produce such a velocity of material transfer through space, such as no other natural phenomenon is capable of exciting. It is clear that if we have to deal here with matter, such as we conceive it, viz., possessing inertia—at all, it must be under the dominion of forces incomparably more energetic than gravitation, and quite of a different nature."

Think now of the admirable simplicity with which Tait's beautiful "sea-bird analogy," as it has been called, can explain all these phenomena.

**THE FIVE RACES OF MEN.**—It is a hundred years or so since the scientific men of Europe settled upon the classification of mankind, which has since prevailed—Caucasian, Mongolian, Negro, Malay and American—a very rude division, which has been found quite inadequate of late years to satisfy the advance of ethnological knowledge. Three or four years ago Professor Huxley indicated his belief in quite a different classification, which he has now illustrated in a paper contributed by him to the British "Journal of the Ethnological Society." He believes in four principal types of mankind, and a fifth which he derives from two of these four. His classification is: 1. The Australoid type found in all Australia, except in Tasmania, and among the hill tribes of the Deccan in Hindostan. 2. The Negroid type, found in all Africa, between Sahara and the cape, including Madagascar, and including as a modified form the Malays and the inhabitants of Tasmania, and the island of Continental Australia, whom, with some others, Huxley calls Negro. 3. The Xanthochroic or fair-skinned type, found chiefly in Central Europe, but extending into Northern Africa, Syria and Arabia, and even as far as Hindostan; and 4. The Mongolian type, inhabiting an enormous area lying mainly east of a line drawn from Lapland to Siam, but including the Dyaks of Borneo and many of the islanders of the Asiatic archipelago, or "Indonesia," who are mixed with the Australoid type, and including also the Esquimaux, Greenlanders and American Indians.

The four great groups of men, according to Huxley, occupy all the world except Western and Southern Europe, Northern Africa, Asia Minor, Syria, Arabia, Persia and Hindostan. In these regions are found, more or less mixed with Xanthochroic and Mongoloids, and extending for a great distance into the regions occupied by the four great types, the Melanochroic or dark-skinned whites whom he regards as a mixture of the Xanthochroic and Australoid types. He considers the Egyptians, ancient and modern, as a modification of the Australoid type, and not Melanochroic; but the latter, in their best form, are represented by many Welshmen, Irishmen and Bretons, by Spaniards, South Italians, Greeks, Armenians, Arabs, and high-caste Bramins.

### Use of Chloride of Iron in Metallurgy.

A process has been patented in Paris by D. Chalandre, for the employment of chloride of iron in the reduction of ores containing sulphur, arsenic, and antimony. The reaction is founded upon the property of the chloride of iron in the presence of air and moisture to decompose the sulphur, arsenic, and antimony compounds of the metals such as iron, copper, cobalt, and nickel. The proto-chloride is changed to sesqui-chloride, and the above-named metals are converted into chlorides. By exposure to the air the chloride of iron is again reclaimed, and can be used over again. It may sometimes be necessary to add a little nitric acid in order to hasten this operation. If iron and copper pyrites are present it is only necessary to add chloride of sodium, as by the presence of the chloride of iron and atmospheric air, the sulphur of the ores will be oxidized to sulphuric acid, which will occasion the formation of sulphate of iron or sulphate of copper, and there will also be produced some sulphate of soda.—*Journal of Applied Chemistry.*

**EXTRACT OF HORSE-CHESTNUT WOOD.**—For dyeing heavy black upon silk an extract of horse-chestnut wood has recently acquired great importance. It is preferred to nut galls or divi-divi for this purpose. To what particular principle in the wood is to be ascribed the important property of which use is now made, has not been determined with certainty, but it appears to be ascertained that the extractive matter of horse-chestnut wood now plays an important part in the silk manufacture of Europe. The question is not one of so much importance in this country as it is in France and Germany, but it ought to occasion a search to be made for some suitable substitute. We doubtless have in our forests, trees that would yield a similar product if they were to be examined. There is a weed growing in great abundance in New England known as *hard hack*, which ought to be examined with reference to its possible use in dyeing and tanning. It is a nuisance as it now exists, and if it could be used for anything, could he had in immense quantity.

**PICRIC POWDER.**—Prof. Abel, chemist to the British War Department, has, after prosecuting numerous experiments, succeeded in perfecting the new explosive agent recently produced by him, under the name of picric powder, as a material for charging shells. Although it is not so violent in action as gun-cotton, nitro-glycerine, or picarte of potash, picric powder is a much more powerful explosive than gunpowder, and has other properties which appear to render it peculiarly adapted for employment in shells. Its merits are, that it may be readily and expeditiously prepared, and that it is remarkable for its safety as compared with all other explosive agents, being somewhat less sensitive to ignition by percussion than gunpowder. The president of the committee of Explosives at Woolwich having pronounced the new powder worthy of further experiment, it will be tried under various conditions in order to ascertain its suitability to the requirements of the service.

**DO FORESTS INCREASE THE RAIN FALL.**—Prof. Henry, of the Smithsonian Institute, in an interesting address upon the methods of observation, and the results of the meteorological observers engaged by the Institution, lately remarked upon the popularly accepted belief, that the removal of forests, and, generally speaking, cultivation, tended to diminish the amount of rain fall. He expressed the opinion that the observations of the Institution, which extend over a period of twenty years, have as yet failed to establish a theory of this kind, and that it must therefore be regarded as a gratuitous hypothesis unsubstantiated by fact.

**YELLOW COLOR FOR SOAP.**—The chemical works of Schering, in Berlin, have introduced two shades of sulphide of cadmium, a lemon and orange yellow, for the coloring of toilet soap. Of all the agents thus far tried to give a lively yellow color to soap, sulphide of cadmium (cadmium yellow) has proved the most permanent. Age and sunlight do not affect the color, and the quantity required is exceedingly small. The application is as follows: The cadmium yellow is rubbed up with oil, and added to the soap under constant stirring. The color is not dissolved in the soap, but suspended in it and much depends upon careful mixing.

## CORRESPONDENCE.

### MINES ON LANDER HILL, NEVADA.

ENS. PRESS:—I left Battle Mountain station on one of Fuller & Clugage's daily coaches to visit the famous "Reese River mines." We arrived at Austin

next morning at 5 o'clock. The place is in a flourishing condition now, although it has been almost at a stand still for the past few years. The reason of this was that the numerous mining excitements in different places carried off the prospectors; but since Manhattan Co. have begun operations and reduced milling rates to reasonable prices, the aspect of affairs has changed. I notice that a large brick court-house is being built; it will be 62x44, two stories high, and will cost upwards of \$25,000. Not an idle man can be found in this place during the day, a fact that speaks well for its prosperity. Many are busy working and sorting over old dumps—a business that pays well. During my last visit I was unable to see the

#### Manhattan Co.'s Mines

for the reason that they were making extensive repairs and alterations to the shafts, buildings, etc., accordingly I determined to do so this time. Mr. John Frost is mining superintendent, and through his courtesy I was enabled to inspect all the principal lodes on Lander Hill, which are so well known on this coast. Many of your readers will recollect the "excitement" of 1862, when this place was first discovered. Mr. Frost located the North Star, and Oregon, at that time, and since then has been connected with the mining interests in this section. There are three engines belonging to this company, all large ones; one for pumping water and air, one for hauling, and one for sawing timber. We went down the shaft in a safety-cage, and found ourselves, when we stopped, 558 feet from the surface. The two shafts are four feet square in the clear, and do not vary an inch all the way down. We passed southeast 350 feet in the drift.

#### The North Star Ledge

runs northwest and southeast, and dips to the eastward. The lode is incased in solid grey granite and will average from 8 to 20 inches in width. This is the deepest shaft on the lode, and the place where they have found the best rock, proving conclusively that the lodes are permanent. From the surface, for a distance of 170 feet, they found chloride and after that the ore changed for the better. The ore I saw at this depth will yield, by the Stetefeldt furnace \$2,000 per ton, and they have about 150 sacks that will mill about \$500. The bullion averages from \$200 to \$250 per ton in silver. The richness of the ore at the lower level speaks well for the prospects of the place. Ascending in the cage to the level 240 feet from the surface, we pass 300 feet east in

#### The Oregon Ledge.

the average width of which is 16 inches. It is a parallel lode with the North Star, and the ore is of good quality, averaging \$250 per ton in the mill. Passing west and crossing the main shaft I noticed that the ledge held its width well. The water taken out of this mine, drains a number of others, the pump raising about 23,000 gallons of water in 24 hours, which furnishes the mill below. The ore contains stephanite chloride of silver and some ruby silver. This company employs about 100 men—working by contract only—giving them a certain percentage and furnishing everything. They get all the way from \$4 to \$15 per running foot for drifting. Where they are now they run from three to five feet in 24 hours, working two shifts.

#### Pacific Mining Company.

This company (of London, England,) owns 8 or 10 ledges west of the Manhattan company, in the center of all the principal mines on Lander Hill. They have run one incline on the

#### Buel North Star,

which is 1,050 feet long, at the end of which, the ledge is one foot thick, the ore assaying \$500 per ton. Capt. Prideaux has

control of this company's mines. There are at present on hand 50 tons of ore ready for the mills which will commence running shortly. They entertain no doubt as to the value of their property and under the present efficient management they will surely be successful. Capt. Prideaux has lately taken charge, the former superintendent having pronounced the mine as worthless, but now everything is running smoothly and good ore coming out. About 50 men are employed. This company own the Matteson 10-stamp mill about 4 miles from Austin and have ordered a White Rotary Furnace with all the improvements from the Etha Iron Works in your city. Mr. John Howell will superintend its construction.

#### Mines Near the City.

The "Saybrook" shaft is 160 feet deep. Rock taken out last winter worked from \$500 to \$800 per ton. Six men are now at work getting out ore. The miners get about \$15 per foot for the work.

#### The Diana

shaft is 325 feet deep the lode averaging a foot and a half. Mr. McIntyre and others have leased it and receive 10 per cent. of the proceeds—10 men being at work. They take out 25 tons of ore per month, averaging \$200 per ton.

#### The South America

is down 300 feet; four men at work.

#### The Oregon

has an incline 280 feet deep and one taking out good milling ore. Campbell & Co. are taking out a ton and a half a day with 6 men.

#### Esther.

This mine was located in 1864. The mine was shut down some time ago on account of the high price of smelting but now that it is so reasonable they are again at work. I am told that the ore from the surface down to 103 feet averaged from \$50 to \$75 per ton. The ore is rich silver and sulphurets, and is improving with the depth.

#### The Magnolia,

west of the Pacific Company's property has an incline 400 feet long. The ore now being taken out will go \$80 and upwards. Ten men are at work under Mr. W. H. Clark's superintendence. The mine itself has paid for all its improvements. The Manhattan mills work the ore. On the

#### Mohawk Mine,

the incline is down 300 feet. They are now taking out good \$400 ore; 40 tons are on the dumps awaiting shipment to the mills. This is a well-defined ledge and is owned by Curtis & Co.

#### North Star.

This ledge has been leased to Tucker, Alexander & Co. The incline is in 150 feet, and they are now taking out excellent ore. They had 15 tons that gave them returns of \$4,000 per ton. This is a valuable piece of mining property.

#### The Pray & Pullen Mine,

on Central Hill, after being idle for three years past, has again renewed operations. They are now sinking and opening up the mine and have an incline down 80 feet.

#### On Whitlatch Hill,

on the south side of Austin, are some very promising mines. The Whitlatch mine has an incline down 300 feet; eight men at work.

#### White's Rotary Furnace.

Some of the citizens of Austin have formed a company, erected a White's Patent Rotary furnace, and remodelled a mill, a short distance below the city. The mill has 10 stamps, 6 pans and 3 settlers. Mr. John Howell superintended its construction and began operations in July, 1871. The patentee receives 50 per cent. of its proceeds of each ton as royalty, until the Co. pays \$2,500, after which they have the patent right themselves. The cylinder is 24 feet long by 30 inches in diameter on an incline one foot in 12. It was cast in sections three feet long and firmly bolted together. There is a fire place at each end; 1,000 pounds an hour have been run through. The furnace is revolved on three two-foot wheels and balanced thereon by four one-foot wheels being turned by a chain belt connected to a counter shaft. The cylinder is lined with fire brick forming grooves, cavities or projections, to lift and drop the ore at one each half revolution of the cylinder. Two cords of wood are used an hour, and about 4-horse power is required to run it. Dry salt can be fed in at the hopper or previously mixed with the ore. The contents can be made to pass from one end to the other at 16 revolutions per minute, in 15 minutes, or if very base can be kept in double that time at a slower speed.

W. H. M.

### "Slate Books."

EDITORS PRESS:—The Silicate Book Slate is an invention—not very well defined by its name—by which a hard surface fit to receive pencil marks of all kinds is put upon any desired substance. We have been using a memorandum book with a silicate surface prepared for the lead pencil. It is very nice to write upon, takes the marks perfectly and retains them as long as may be desired, and then in a moment by using moisture every mark may be removed. When the surface is black the slate pencil can be used equally well.

We saw a large sheet of pasteboard at the Fair coated with the silicate surface and designed for the use of a draughtsman in a machine shop. He intended to use it for making his first designs upon. Of course whenever it was necessary to change a line he could do it with the greatest ease, yet the whole drawing would be permanent enough to last until copied.

The Silicate Book Slate Company of this city, to judge from the display made at the New York fair, must manufacture a hundred different articles in which these silicate surfaces are used. Among them we noticed blackboards, account books, time tables, wages books, wash bills, memorandum books, school slates, tablets, drawing books, ruled books for rough draughts of writings, and a great many other things. All of these are made for both lead and slate pencils. W. E. P.

### Manhattan Co.'s Mill and Furnace.

ENS. PRESS:—The Manhattan mill which is located at Austin, Nevada, has been remodelled during the past few years and all the late improvements added. It was started up after repairs in July, 1870. The mill has 20 stamps weighing 640 lbs. each, which drop from 90 to 100 times per minute. It crushes from 20 to 26 tons of ore in 24 hours, which is carried by screw conveyers from the batteries and elevated into the large hopper at the top of the Stetefeldt furnace, and fed through one of Standish's pulp feeders, the percentage of salt being added from another machine of the same kind.

The feeding of dry pulp from a hopper is so as to get a certain number of pounds per minute, and no more or less, which is most successfully accomplished by this little machine, that has been running for over a year without the necessity of repairs. The salt is not crushed with the ore, but is kept separate and fed in proper quantities into the ore, being thoroughly mixed with it before entering the furnace. The ore after being roasted is taken in a car to the pan room, which is one of the finest and best arranged in the State. The building is 79 feet, by 37 feet 6 inches, and contains eight of Standish's improved pans and settlers. The pans are driven with disc frictions, which are considered a decided improvement over belts. The pans are 5 feet in diameter by 30 inches in depth, and carry one ton at a charge. They have valves instead of plugs, which are constructed with a rubber face and are operated with a lever in a very convenient manner. Over each pan and settler is an iron track with a traveling hook for hitching a chain tackle for the purpose of handling any of the machinery and saving all heavy lifting.

The amalgam after being drawn from the settlers through iron bowls attached to the bottom, is carried by its own gravity to a very ingenious contrivance for washing and cleaning, after which it is elevated into a reservoir, and from there drawn into the canvas strainers as required. The quicksilver, after being strained, is then taken to another reservoir, and from there conducted in pipes to iron bowls, one of which is placed near the top of each pan. The amount of quicksilver in each pan at a charge is 600 pounds, making 4,800 lbs. for the eight pans; and as they are charged three times in 24 hours, 14,400 pounds are required for use. A great deal of time is saved by employing machinery for handling it. The retort and smelting room is about 30x40, and contains three retorts and two furnaces for melting bullion. The machinery is driven by a fine engine of 18-

inch bore and 42-inch stroke, which uses from 6 to 7 cords of wood per day, costing \$10 per cord. Mr. E. V. Standish has arranged all the machinery in the most complete manner, and its successful workings are to his credit.

The Stetefeldt furnace, under the charge of Mr. Francis Seip, and which was described and illustrated in the SCIENTIFIC PRESS some time since, is giving good satisfaction both to the company and to the miners. The charges of pulp are drawn every three-quarters of an hour and wet down while red hot. The stack is 30 feet high. This company have reduced the charges from \$50 to \$20 per ton. Five hushels of coal and wood are burned every hour. They return on ores running less than \$300, 80 per cent.; from \$300 to \$500, 83 per cent.; 500 and upwards, 85 per cent. Forty pounds of ore can be roasted per minute, making a total of 2,400 an hour. The proportion of salt used is from 6 to 10 per cent. The mill and furnace are under the efficient management of Mr. Allen A. Curtis. W. H. M.

### San Diego Mines.

ENS. PRESS:—Our mining interests are improving daily, and we are all hopeful of a bright future. The

#### Golden Chariot

still continues to take the lead in the way of profit. The owners are now in your city negotiating for a mill. This vein is between the granite and the slate, and is traceable for at least three miles. It is too small to work with profit at all other parts except where they are now. All the other mines in this district are in talcose slate. On the

#### Bailey Mine

they are still at work taking out rock, and the ledge is widening daily. The ore will require roasting to pay well.

#### The Redman

is being worked in a systematic manner. The vein is nine feet wide at bottom of shaft. This ledge has produced more bullion than any other in the district, although the average per ton has been less than many others. Thirty tons of rock from the

#### Kentuck

yielded, as near as I can ascertain, at McMechan's mill, \$50 per ton. The lode looks well, and the ore shows plenty of free gold.

#### The Madden

varies in width from two inches to two and one-half feet, and the rock looks rich; in fact, this ledge has paid better than any other in the camp—the Golden Chariot excepted. A specimen from this ledge in the late Mechanics' Fair was prominently noticed in the SCIENTIFIC PRESS.

#### The Antelope

appears to be worked in a very loose and careless manner; but for all that it is one of our best mines, and, if worked with skill and good management, would pay its owners well. There are 25 feet of vein matter between the walls more or less rich, but the best rock only is worked.

The Ophir, Chapparral, Warlock, and City of Richmond are all idle. Mr. Whitney, of the firm of McDouald & Whitney, of your city, is at present superintending the McMechan mill and Redman mine. Mr. F. R. Wilson, having secured a good mill site at Banner City, intends erecting one of his patent steam stamp mills shortly.

QUARTZ.

Banner City, Oct. 14, 1871.

NOT CARRIED OUT.—When in Washington in May last, Commissioner Leggett, informed us of the intention of the office to supply each inventor for the term of six months after his patent issued with full copies of all patents, issuing in the same class as his own. We predicted at the time of publishing our notice of such intention, that we did not deem the idea a practical one, and we now have to inform our readers that it has never been carried out by the department.

ELECTROTYPES BY MAIL.—On the authority of the attorney of the N. Y. City P. O., given personally to the N. Y. editor of the PRESS, we recently stated that wood cuts, etc., could be sent by mail at newspaper postage rates. Three weeks later, we found the attorney's decision reversed, without any explanation, and letter rates of postage are demanded.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**ALPINE CHRONICLE.**—Oct. 19th: The bullion producing part of the Exchequer mill will start up in a few days.

### AMADOR COUNTY.

**MINE BONDED.**—*Jackson Ledger*, Oct. 21st: The good Hope Quartz mine within the limits of Jackson, has been bonded to an English Co.

### CALAVERAS COUNTY.

**PETTCOAT.**—*Calaveras Chronicle*, Oct. 21st: Pay ore has been struck in the shaft now being sunk in the mine. The lead shows a solid body of quartz from 3 to 4 feet in width, sufficiently rich in gold to pay the expenses of sinking.

**PRUSSIAN HILL.**—Thirty tons of Prussian Hill ore crushed, yielded about \$1,100. The rock was taken from a shaft 70 feet in depth, and the lead improves as they go down upon it. They have bargained for the "French" mill at Rich Gulch Flat, which they intend removing to their mine as soon as practical. The battery consists of 15 stamps, a 35-horse power engine furnishing the motive power.

**CORRAL FLAT.**—Champion, Boughton & Co., proprietors of the Corral Flat mine, closed up again recently. The mine pays \$6 per day to the hand.

**READY TO CRUSH.**—Horchner Siegler & Key, proprietors of the San Bruno mine at Mosquito Gulch have quite a quantity of rock in readiness for crushing.

### INYO COUNTY.

**ECLIPSE.**—*Inyo Independent*, Oct. 14th: Operations at the mill and mine are being carried on with vigor. A mile and a half of the tramway to the mine is completed. All the hands are engaged in deepening the ditch—taking a bench of about 18 inches in depth from the bottom of the upper end of it, for a distance of 2 miles, to let in a greater supply of water. A portion of the battery—20 stamps—is completed and has been running during the past week.

### LOS ANGELES COUNTY.

**MINING AT OWENS RIVER.**—*Los Angeles News*, Oct. 14th: The Swansea M. Co. has suspended operations for the time being. The Eclipse quartz mill—40 stamps, worked by water-power, is running full time.

### NEVADA COUNTY.

**ROUGH AND READY.**—*Nevada Transcript*, Oct. 20th: At Randolph Flat the Picayune Co. have been running their tunnel for 16 months. They have run a bed-rock tunnel 725 ft. and have struck an excellent bed of gravel which prospects from 25 to 50 cents to the pan.

The Webster claims, adjoining, are being worked through an incline. From a piece of gravel 25 by 100 ft. this Co. have taken out \$27,000.

Torpy & Co. have their shaft down to gravel and are hoisting pay dirt with a whim.

McSorley & Co. have run a tunnel in from the face of the bank 250 ft., and are "breasting out" for drifting.

The Portuguese Co. working the extensive Ladd claim, are putting in a substantial flume for the purpose of working their ground on a larger scale than hitherto. There is some prospecting for quartz going on.

The other Co.'s near by own hydraulic claims and cannot start until water can be obtained.

**MAGENTA FLUME.**—This flume, on the line of the Eureka Lake and Yuba Canal Co. is being taken down. It cost about \$80,000, and was considered a wonderful but useless engineering work. The Co. will build a new flume 90 ft. lower, at the gap. They are also digging a new ditch from below the flume to a point opposite Moore's Flat. It is estimated that the new work will cost \$20,000.

The South Yuba Canal Co. have recently repaired and improved all the ditches in Nevada and Placer counties. In this work the Co. has expended \$30,000. For several months 150 men have been employed upon these works. At the head of the ditch, where the hoxes have frequently washed out in heavy winters, a shelf has been cut under the granite bluff, and the flume so securely put in that there is little danger of its being washed out in the future. A new flume, leading out of Bear Valley has been rebuilt for a distance of 8,400 ft. and over 6 miles of flume have been repaired.

**NORTH STAR.**—*G. V. Union*, Oct. 14th:

The mine is sending splendid ore to the surface. The mill is running constantly, using all the water attainable for the batteries, and the platforms are crowded with ore. Several improvements at the mine and mill are contemplated. A new mill engine is to be put in, hoilers are to be renewed and a new shaft, to the east of the mill, is to be put down.

**NEW LEAD.**—The Prospect Co. have located 2,100 ft. on a recently discovered quartz ledge near the South Star mine. They have sunk a shaft 40 ft., from the bottom of which they are taking out a test crushing. The rock at that depth shows well in sulphurets, and gold is also visible.

**KNIGHT OF MALTA MINE.**—Caruana & Co. are doing splendidly on the ledge. It is a large one for this dist., and is filled with rich sulphurets and free gold. Work in sinking on the ledge and running drifts is being constantly done.

### PLACER COUNTY.

**COX & DENTON.**—*Auburn Herald*, Oct. 21st: A new body of ore has been struck in this mine which is richer than any previously taken out. A contract was lately let to sink the shaft 50 feet deeper, and in going down this body was developed.

**STRUCK IT AGAIN.**—McFadden has opened on rich ore in the old Peter Walter mine in the Ophir dist.

**EVENING STAR.**—Rich ore is being taken from the mine, on Rock Creek, 3 miles from here. On the first discovery of this mine it was rich, but the wall rock was very hard and the expense of sinking was very considerable. Where the new strike has been made the rock has been found to be softer and the ore rich. The Co. have a steam mill, hoisting works, etc., at the mine, and crushing will soon commence.

### PLUMAS COUNTY.

**A BIG MILL.**—Applegarth Bros., who recently purchased the Indian Valley mine, are commencing operations on an extensive scale. It is their intention to erect a 40-stamp mill. The shaft (in which the recent fire occurred) will be abandoned and the mine opened so as to work it to a better advantage than formerly.

### SAN DIEGO COUNTY.

**BULLION.**—*San Diego Union*, Oct. 12th: There was shipped by W. F. & Co., on Monday, bullion, amounting to \$1,880.

**SILVER ORE FOUND NEAR SWEETWATER.** A short time ago indications of the existence of silver ore were discovered about 30 miles from town, on Sweetwater, near Cajon Ranch, and a small party of prospectors, went there about 10 days since, and commenced to develop the lead, which, when they left off digging, was 4 ft. wide and likely to widen further as developed.

**SAN DIEGO MINING.**—The McMechan mill which had stopped temporarily is again running night and day upon ore from the Redman lead. The Antelope mill has been leased, and is running night and day. The Helvetia Co. has suspended work for a short time, on account of the death of the foreman.

**JULIAN.**—*Cor. same:* The Owens' mine has a shaft down 180 ft., and the men are running a drift for air. There is a fine body of ore in sight. The Lone Star Co. is taking out some exceedingly rich rock. The Big Blue ledge looks well, and shows as much free gold as ever. They now have on the dump about 35 tons of very rich rock. The "Count's" ledge is at present doing nothing. The Hayden boys are sinking down at present, and therefore not taking out much rock. The ledge looks well, and the rock shows plenty of free gold.

**THE FRARY.**—or Stonewall—mine, is probably the largest and most valuable in this part of the State. The shaft is about 100 ft. deep and still going down, with only one level started, and this at the depth of about 60 ft. On this they have drifted 180 ft. to the south, and 100 ft. to the north. No rock has been stoped out as yet, the rock taken out in running the drift being sufficient to run the mill. The face on the north drift shows a ledge of pay ore at least 12 ft. wide.

The Bailey mine is said to have been bonded to Whitney, who has also bought half of the McMechan mill. The price is said to be \$20,000. The Golden Chariot boys are pushing things in their mine, and are taking out splendid rock.

### SIERRA COUNTY.

**SPECIMEN ROCK.**—*G. V. Union*, Oct. 22: We were shown yesterday a sample of quartz taken from a ledge discovered ten days since, about a mile from Downville. The rock shows rich in free coarse gold, and the lead will likely prove a valuable one.

### TUOLUMNE COUNTY.

**MANGANESE ORE.**—*Stockton Republican*, Oct. 18th: A large quantity of this ore from a town near Jamestown, is being

brought down for shipment. It goes to Phila., where it is used in the process of manufacturing steel.

### YOLO COUNTY.

**COAL IN CAPAY.**—*Woodland Mail*, Oct. 19th: D. H. Rice has left with us specimens of coal discovered by himself and others, in the mountains at the head of Capay Valley. There are good indications of a large and permanent vein and the specimens are of good quality.

## Nevada.

### EUREKA DISTRICT.

**PHENIX.**—*Eureka Sentinel*, Oct. 18: This Co. is bringing to the surface about 30 tons of high-grade ore per day from the Adams & Farren incline. The incline is down 200 ft. and the drifts are full of ore. A whim will soon be erected.

**COMPLETED.**—The new grade of the Eureka Con. Co., leading to the Sentinel mine, Ruby hill has been completed. A substantial ore dump at the mouth of the tunnel is in course of construction.

**PINTO MILL.**—The new mill is rapidly approaching completion, and will soon be in successful operation.

**OUTSIDE DISTRICTS.**—**SCHILL CREEK.**—A gentleman from that dist. describes the mineral belt to be 15 miles in length, and over one mile in width. The El Capitan is the principal mine of the dist. This ledge is 100 ft. wide, and for nearly 1,000 ft. the ore crops out 60 ft. above the surface. Assays have been obtained running up into the thousands.

### ELY DISTRICT.

**BULLION SHIPPED.**—*Pioche Record*, Oct. 19th: W. F. & Co. shipped since Oct. 12th, 47 bars of bullion valued at \$86,563.95.

**RAYMOND & ELY.**—From the 1st to the 13th of this month the Co. shipped as follows: On the 1st, \$43,571.41; 7th, \$48,027.15; 13th, \$50,005.28. Total \$142,493.74.

**PIOCHE MINE.**—The hoisting works are being rebuilt, with stone foundation, and everything placed in readiness for the reception of the engine, expected to arrive about the 20th.

**SOLD.**—The "Justice" mine was sold on Tuesday last for \$15,000. The shaft is 5x8 ft., over 100 ft. deep, and is about 50 ft. due west from the Lightner Shaft, on the Panaca of the Raymond & Ely Co. mines.

### HUMBOLDT.

**ECLIPSE.**—*Unionville Silver State*, Oct. 21st: The Co. have been employed for 3 or 4 weeks arranging preparatory to working the mine. They have a quantity of rich ore in sight.

**GALENA.**—The Shiloh mine still hangs fire. It is reported conditionally sold to English Co.

Butte Co.'s mill and mine are still taking a rest.

The English Co.'s copper mine, at Copper Cañon, is yielding more rich ore than it ever did before in the same length of time.

**GOOD ORE.**—*Winnemucca Register*, Oct. 21st: S. Kunkle exhibited this week some rich specimens of ore from his mine in Winnemucca Mt. The Kunkle Bros. claim is the first location south on the Pride of the Mt. ledge. They have already sunk shafts and run drifts in various directions on the ledge, and have taken out several tons of excellent ore. For 2 months they have been driving the main tunnel, which will have to be run 20 ft. further to tap the ledge.

**GALENA.**—The Nevada Butte M. Co. have decided to put up a large roasting furnace at their mine in Galena Dist.

### REESE RIVER.

**BEOWAWE.**—*Austin Reveille*, Oct. 14th: The owners are working on their ledge at a depth of 210 ft. and getting fair ore.

### WASHOE.

**BELCHER.**—*Virginia Enterprise*, Oct. 21st: This mine is looking better than ever before. The ore body on the 1,100 foot level has been opened to a distance of 200 ft. in north and south. For 100 ft. in length the deposit has been stoped out eastward to a distance of 70 ft. from the west wall, and the ore still continues. They are engaged in stoping to the east and south. From the sill floor they have raised to the height of two floors and have there stoped out a space 60 ft. in length by 50 ft. in width; with ore on all sides;—on the sill floor they are working from the west wall to the eastward and southward as stated above. Altogether, since they began working this huge body, there has not been hoisted out from it a single car load of waste rock. All goes to the mills just as it is dug down. At the extreme south end of the drift a cross-cut to the eastward has been started. This is in 40 ft., and in fine ore, with every indication that at this point of deposit will reach a width of 100

ft. In the old works a winze is being sunk which connected with the 900 ft. level of the Crown Point yesterday. This will be carried down for the ventilation of the stopes on the 1,100 ft. level of the Belcher. In the old works they are sinking an incline from the 850 foot level through which to hoist ore from below. This will be divided into two compartments, each 6½ ft. in height by 5 ft. in width. At the old mine they are erecting new hoisting works, which will be provided with two new hoisting engines and new machinery. They are hoisting from the deposit on the 1,100 ft. level, 180 tons of ore per day, which yields \$81 per ton.

The big dam of the Union Mill Co. on Carson river, will be completed by the first of next month.

**STRUCK WATER.**—Daney Co. have struck a considerable stream of water in a drift on the 400 ft. level.

**SIERRA NEVADA.** Co. are running their mill with plenty of low grade ore in sight. They have not yet started up the Sacramento and Meredith mill.

**YELLOW JACKET** mine is yielding 70 tons of ore per day. They have resumed crushing.

**TRAINS OF CAGES.**—Some of our leading mines are using two cages, one above another and the plan is found to be so economical that we should not be surprised to see a third cage added after a while.

All the mills on the Carson are being enlarged, improved and put in thorough order. There are probably three or four hundred machinists, carpenters and laborers at work on the river between Carson city and Dayton.

**THE OLD KELSEY MILL.**—*Gold Hill News*, Oct. 18th: The mill at the lower end of Silver city is being thoroughly overhauled and the machinery throughout put in complete order for another long and efficient run.

**RICH.**—The pulp assay of ore from the Belcher at the end of last week gave, gold, \$502; silver, \$39; the total at \$541 to the ton.

**PAPPOOSE MILL.**—The mill, Lower Gold Hill is having its internal arrangements overhauled and reconstructed. The steam machinery is being repaired and refitted, and the hoilers overhauled. The steam creative and working capacity will be increased by the addition of the hoiler from the Eclipse mill and an engine from Virginia.

### WHITE PINE.

**BULLION.**—*W. P. News*, Oct. 14th: W. F. & Co., shipped to-day on account of South Aurora M. Co., 3 bars weighing 180, lbs valued at \$3,399.88.

**CASPIAN.**—The incline and drift is down 230 feet and about 150 feet vertically from the surface. The drift has penetrated the spar ledge nearly 30 feet showing an immense body of spar of a highly silicified character.

**HENLOCK.**—Sinking and finding good ore at a depth of 50 ft.

**GLAZIER.**—The drift running to connect the Slauson with the Osborne shaft is progressing finely. The ore body in sight is 6 ft. wide.

**ROUGH & READY.**—The shaft is going down through white spar. There is a fine showing of low grade ore in this mine.

**NORTH AURORA.**—Drifting north and south from the Lady's Chamber, for the purpose of prospecting the ground ahead of the main workings; 40 tons of ore are hoisted daily. Hoisting from the Risale chamber and taking out a better quality of ore than has ever before been extracted. Drifts running north and south to find the extent of the ore body.

**EDGAR.**—A vast improvement has taken place. The foot wall is pitching east. Down at a depth of 110 feet a body of ore is in sight 20 feet thick, showing chloride and horn silver. Now running to connect with the Anchor tunnel for air.

**EAST SHENOYAN.**—Horn silver ore is found in all the faces of the works. The Oxford shaft will be started on Monday to strike the vein 100 feet from the Regent. This will make an extent of nearly 300 feet in length, from north and south, that the Co. is operating on. The last crushing yielded at the rate of \$50 per ton.

**PORTAGE.**—Work will be resumed in a few days.

**ARGYLE.**—Sinking shaft, with a fair quality of ore in sight.

**EBERHARDT.**—Working in the drift running from the Keyatone shaft.

**WARD BEECHER.**—Hoisting from the Buchanan and Phillips chambers 40 tons of ore per day.

**SILVER WAVE.**—All the works of the mine have been let out on contract.

**BIG SMOKY.**—Purchased by the Hidden Treasure Co. Every department of the

mill will be overhauled before starting up again, which will occupy about two weeks.

**WEST SIDE-TRENCU.**—Since last report a body of ore 4 feet wide has been developed in the southeast drift assays of the rock averaging \$300 to the ton. The Monte Cristo mill started up this week on ore from the mine.

Arizona.

**MOHAVE Co.**—Prescott *Miner*, Oct. 7th: Vein of Little Chief narrow, but widening, as progress is made. Ore rich in chlorite. ... Franklin lode is 4 ft. between walls, and contains rich carbonate ore. The owners have sunk upon it 7 ft. ... Little Tiger carries great quantities of native silver, besides much chlorite. ... Cupel lode, quite a large vein; carries argenteiferous galena and carbonate ores. Monitor lode shows rich antimonial silver ore in abundance. ... Woodworth lode is a large and well-defined. ... Union is large galena and carbonate lode, on which two shallow shafts have been sunk. ... Vanderbilt has been pierced by a shaft 50 ft., and the ore has assayed from \$200 to \$700 per ton, in gold and silver; 50 tons of ore on the dumps. ... Five Forks lode has a shaft 20 ft., from which 15 tons of what appeared to be good milling ore was in sight. ... Near by, Fee & Co. expect to erect a furnace, or furnaces, to work the ore from their mines. ... Champion lode averages 4 ft. in thickness. It crops out above ground for a great distance. ... Buckeye lode rich in silver, has been prospected by shafts. ... Savage, rich in carbonate. Shaft 8 ft. deep. ... Todd has rock yielding from \$300 to \$500 per ton.

**MINERAL PARK.**—Keystone lode appears to be the mother vein of this section. It crops out boldly for a long distance, and, on the surface is very thick. Two shafts, one 45 and the other 25 or 30 ft. from the surface, have been driven in the vein, at either of which the ledge, at its narrowest, is about 4 1/2 ft. thick. All the ore extracted was what may be termed rich sulphure ore, with, occasionally, free silver and gold. Water, of good quality, abundant in the deeper shaft. ... Stark and Ewing lode—chloride, horn silver, native silver and free gold are observed, scattered plentifully throughout the vein matter. The owners are sinking through the country rock, near the metal, which they soon expect to strike. ... Fairfield lode is 4 ft. thick, and very rich. The ore is free sulphure. The owners are hard at work sinking. ... Mayflower has a shaft 20 ft. deep. The lode is 3 ft. thick, and rich in silver and gold. ... Setting Sun lode is being prospected by an open cut, in which the body of ore was 4 ft. thick. This, at a depth of 12 ft. from the surface. The ore is "free milling," and pieces have assayed \$1,300 in gold and silver. ... Washington lode has a shaft 8 ft. in depth. ... Alabama prospected very slightly. Ore, carbonate. ... Richmond, a carbonate lode, carries 42 per cent. lead and 150 ozs. of silver to the ton.

**WOOD LANE** has a 14-ft. shaft. ... Philadelphia lode has a shaft 21 ft. in depth, developing a pretty ledge of rich quartz, and striking water. ... Cedar lode showed 2 1/2 ft. of paying ore, at a depth of 30 ft. ... Ku-Klux contains silver and gold in paying quantities. ... Herpison lode has on the dump 30 tons of good milling ore. ... On Porter lode, the owners have gone down 25 ft. and have taken out a huge pile of free milling ore. ... Defiance has a shaft 20 ft. deep. ... Panawa, a large galena lode is being prospected by an open cut. ... War Horse ledge, galena, 2 ft. thick. ... Rifleman is 4 ft. thick—free milling ore. ... Antietam has a 30-ft. shaft, and 2 ft. or more of silver-copper glance ore. ... Upon the Oriental, galena lode, is a shallow shaft. ... Into the Pride of Arizona, an open cut has been run, revealing a splendid looking mass of ore, some of which had yielded well in gold, silver and lead. ... Snaflower has a 3 ft. vein in a 20 ft. shaft—contains carbonates and argenteiferous galena in paying quantities. ... Conner lode of 4 ft.—contains carbonate and free milling ore worth from \$100 to \$700 a ton. ... "Daniel Webster" and "Dandy" lodes have undergone some piking, and are both looking well. ... Silver Hill lode has a shaft 125 ft. in depth, showing a 3 ft. ledge of galena and sulphure ore. ... Katy, another carbonate lode, is being developed. ... Empire, a large carbonate ledge, has assayed from \$100 to \$500 to the ton in silver. ... Starr King has a shaft yielding free milling ore. ... Independence shows well on top. ... In the Tecumseh lode, the croppings in places on the surface measured 11 ft., and pieces of top rock assayed \$500 to the ton.

**BRADSHAW.**—A recent run of 72 hours, with 5 stamps on Del Pasco ore, netted

between \$700 and \$800 of nice gold dust. One ton of Tiger ore, recently worked at S. F., yielded \$1,500 over and above the cost of transportation and working.

Colorado.

Work is being actively pushed on the Phoenix lode, Sherman Mt. A number of men are working the vein on leases and are doing well.

Guthrie lode, Republican Mt., is being worked in several places. A pile of good ore is on the dump.

Crystal lode, Virginia cañon, is being actively worked with good results. It is being opened by two parties.

**CLEAR CREEK Co.**—*Central Register*, Oct. 18th: Three months ago, 4 miners took a contract to run a tunnel to cut the Pelican lode. When it reached a point 40 ft. from the mouth, they cut a vein 6 inches thick of sulphure of silver. They began immediately to develop. They have made a handsome "stake." The ore runs about 600 ozs. to the ton, and is easily worked.

**GRAND ISLAND.**—*Central Herald*, Oct. 11th: Breed's Mill, at Middle Boulder is fast approaching completion.

Caribou mine is looking finely. In the bottom of the shaft there is an 8 ft. crevice of fine ore.

**IDAHO.**—Some 80 miners are employed at the Seaton, Queen, Santa Fe and Crystal lodes, above Idaho, and the quantity of silver is very rich.

In the Idaho mine near Caribou there are 8 inches of first-class ore in the bottom of the shaft, besides a large crevice of second and third class rock. It is reported that the mine is about to be sold.

Wild Waggoner tunnel is in 145 ft., the head of the tunnel being 65 ft. below the surface. The tunnel will follow the course of the vein for 1,600 ft., intersecting the discovery shaft 225 ft. below the surface, 400 ft. in. At this point it is crossed by the Lella lode, into which a branch tunnel will diverge from the main drift. The head of the main tunnel, when 1,600 ft. in, will be 417 ft. below the surface at that locality. On the surface the distance between walls is 17 ft. at the discovery, assaying from 9 to 13 ozs. At the bottom of the shaft, 80 ft. below the surface, the crevice material has a width of 25 ft. and 8 inches.

The Boston & Colorado Smelting works are treating about 30 tons of quartz and tailings per day.

Mr. Calbugh is mining near Georgetown and on the Crystal lode above Idaho most profitably.

Work continues steadily at the Hiawatha Tunnel near Mill city.

B. S. Buell has been raising large quantities of rich gold ore from the Illinois during the past month.

T. J. Sales, of the Edgar mine, informs us that the mine is looking finely.

The once celebrated Gunnell lode, after laying idle for several years, wears a lively appearance; 8 claims are now being worked.

Idaho.

**BULLION.**—Owyhee *Avalanche*, Oct. 14th: W. F. & Co. shipped from here last week 6 bars valued at \$11,417.74.

**SOUTH MR.**—Some of the ledges are 50 feet in width and traced for miles. The ore is argenteiferous galena, easily worked. Assays from various ledges range from \$20 to \$475 silver per ton.

**ITEMS.**—On the Ida Elmore two drifts are being run in the 5th and 7th levels respectively, north of the shaft. The width of the ledge is 3 feet.

The Minnesota shaft is down 140 feet. A contract has just been let to sink 100 ft. deeper. The ledge is 2 feet wide and contains good milling ore.

Utah.

**BULLION.**—S. L. *Tribune*, Oct. 20th: W. F. & Co. shipped to N. Y. Oct. 14th, of Pioche bullion, 20 bars, valued at \$48,027.15. On the 19th, 18 bars, worth \$50,905.28 from same place, and on the day previous 13 bars, worth \$15,258.

**HOWLAND & Co.** have shipped during the week 3 car loads of bullion to Chicago. They have sold their sampling works to Richmond, of Chicago. He designs purchasing ores in the mines, on the dump, and will add to the present facilities an amalgamating pan, for treating carbonate ores in large quantities.

**SATURN S. M. Co.**—This Co., in Bing-ham, shipped yesterday, 40,000 ft. of lumber to construct buildings for their hands. The Co. designs erecting 3 blast furnaces.

**UNIVERSITY OF CALIFORNIA.**—The Preparatory Department is under the charge of five Professors of the University, and six tutors.

Besides the studies of the public schools, Algebra, Geometry, Latin, Greek, German, French, Spanish and Book-keeping are taught.

Terms: Board and tuition, 4 weeks, \$30. Students received at any time. GEORGE TART, Oakland, Master Fifth Class.

Mineral Stock Market.

THURSDAY EVE., Oct. 26th, 1871.

Stocks have been quiet throughout the week. The sales at this Board for the week ending on Thursday the 10th inst., aggregated \$3,749,580. Reports from the Crown Point mine are of a very favorable character. The San Jose Mining Co. levied their first assessment of \$5.00 delinquent on November 23d. The total amount of the assessment of the Golden Chariot is \$50,000, of which \$20,760 is yet unpaid. This last weekly report of the Hale & Norcross mine shows 730 tons extracted, and 2,600 tons on the dump; that of the Savage shows 550 tons taken out, assaying \$31.20. On October account over \$100,000 have been shipped from the Meadow Valley mine.

**JOURNALIST.**—Mr. W. H. MURRAY, agent of the SCIENTIFIC PRESS and PACIFIC RURAL of S. F., is canvassing our town for those excellent papers. Mr. Murray was here last year and obtained large lists for the PRESS. He has since visited other Territories with like results, and now comes to introduce that other worthy exponent of an equally great interest—agriculture and stock growing. He will visit other camps of this county and Missoula in the course of a few days, to solicit subscriptions.—*New Northwest, Montana.*

## INDIFFERENT METALLURGY.

[From the Overland Monthly.—Concluded.]

The truth conveyed in the words of the Right Honorable Robert Lowe, Chancellor of the Exchequer of England, is certainly applicable to our case: "I think," says he, "it is more important for a man to know where his liver is seated, and what its functions are, than to know it is called *jecur* in Latin and *epar* in Greek."

The better acquainted a man who superintends or works a mine is with its peculiarities, the more successful and profitable will be the application of his labor. What we consider to be essential for the proper furtherance of the interests of the Pacific Coast, is the establishment of a mining-school for the efficient education of those intending to devote themselves to that particular business. And, inasmuch as it is evident that the principal feature in its future industries will appertain to minerals, does it not seem of the most vital importance that the rising inhabitant of the Occident should be prepared for the right and intelligent fulfillment of the duties which will inevitably fall to his lot? We must, sooner or later, arrive at the conclusion that it is.

The Chair of Chemistry and Metallurgy connected with our young State University, was, as originally established, a step in the proper direction. It was just the thing required by this pre-eminently metallurgical region, for it was undoubtedly the most important and indispensable branch of scientific education taught at the University. The beneficial effects it would have had upon the future working of our mines and the treatment of their products, would, in all probability, have exceeded the most sanguine expectations. It is somewhat strange that it should be viewed differently by the Regents. They evidently consider it of only secondary importance—a branch of science having but an indifferent bearing upon our future metallurgical prospects. By them, it has been thought best to abolish it as an independent professorship, and incorporate it with the Chairs of Agriculture, Horticulture, and Agricultural Chemistry. We cannot otherwise consider, than that, in so doing, they have acted unadvisedly. The wants that we have perhaps imperfectly expressed evidently demand that metallurgical chemistry, at least, should have remained independent. It is practically impossible for one Professor to fulfill faithfully the duties appertaining to two or more branches of scientific instruction. He cannot give to them that undivided attention which each one requires, ere it can be justly dealt with, especially when the student is more dependent upon the practical demonstration, than he is upon a theoretical explanation, for a right understanding of the instruction attempted to be imparted to him.

A practical knowledge of metallurgical chemistry—the only one of any value to the miner—can be obtained in the laboratory alone. The lecture-room, no matter how ably and intelligently it may be managed, is, nevertheless, only a place where the student obtains the theory which is to be demonstrated to him in the laboratory. The duties of one chair, consisting of theoretical and practical instruction, require all the time and energies of the tutor devoted to them, so as to fully demonstrate to the pupil the principles of that particular branch. In many European mining-schools, the Professors have demonstrated under their direct supervision, who illustrate in the laboratory the theories laid down in the lecture-room. Each department is thus complete and independent. As at present taught in the University of the State of California, the science of metallurgy is a nonentity to the Californian. Having lost its identity as an independent branch of education, it must fail to attain the object at which it professes to aim. Had it been otherwise, the instruction imparted could not possibly be as complete as that which would be given in a school of mines. A mining education, received in any University, cannot be of the same practical value as that obtained in a school making it its specialty.

For the establishment of such a school, San Francisco, or its vicinity, presents superior advantages. Its central position on the coast affords easy access to our various mining districts, and the student would be enabled to acquire a thorough knowledge of the manner in which their ores are extracted and reduced. The absence of such an institution has been seriously felt throughout our common country. Hundreds of millions of dollars now lie among the tailings of our mines, irrecoverably lost, owing to the want of a scientific knowledge of the ores when undergoing

treatment. It is to the efficiency of a school of mines, when once permanently established, that we shall be in a great measure indebted for the completeness of the success attending the future development of our metallurgy. Whether such instruction will ever be imparted with that singleness of purpose in the State University, or not, it will be found as valuable as a means of mental training as it is for practical application. All scientific study really makes the student more apt in the acquisition of other branches of knowledge.\*

We cannot fail noticing, also, the increased interest our mines are now commanding, through the facilities for the transportation of their products to market by the numerous railroads already intersecting the country, as well as by those proposed to be constructed, at an early date, through hitherto inaccessible regions of well-known mineral wealth. The mountainous character of many of our richest mining districts is such, however, that they cannot be penetrated by the broad-gauged railroads in common use. And the outlay of capital required for the construction of those already built has been so great, that their number and the extent of their usefulness have been necessarily limited. A new era in railroad history has happily dawned—one that promises to have a great influence upon the metallurgical prospects of the Pacific Slope. The satisfactory results obtained by the introduction of improved rolling stock, upon roads of extremely narrow gauges, are of such importance as to threaten to produce a complete revolution in the entire system of railroad construction. It is to our hitherto impregnable mining districts that we believe these narrow-gauged railroads are peculiarly adapted. The comparative nominal outlay of capital required for their construction, the limited wear and tear, and cost of working, will naturally cause them to be extensively introduced at an early date in all our mining districts, giving an impetus to our interests unparalleled in our past history.

\*At the last regular quarterly meeting of the Board of Regents of the University of California, held on the 6th of September, a communication was received from the Academic Senate, recommending the appointment of a competent Professor in analytical chemistry, mining, metallurgy, and mineralogy.

## ON THE ASSAY OF GOLD.

BY HENRY G. HANES.

[Expressly for the Press.—Continued.]

Pure gold has a reddish yellow color and high metallic luster. It is quite soft, more so than silver, is extremely malleable and ductile. It does not dissolve in boiling nitric acid nor impart any color to it, but it is readily soluble in nitro-hydrochloric acid. It may be distinguished from all other substances by the following easily applied tests.

It is the only yellow metal or alloy which is malleable and not acted on by acids, and which fuses on charcoal before the blowpipe into a bright bead without incrustation.

When in sufficiently large pieces it may be recognized by being flattened out under the hammer and cutting with a knife without crumbling.

Gold when largely alloyed with other metals cannot be so easily distinguished as its associates somewhat modify the reactions. The color of native gold is degraded by the metals with which it is alloyed. In some localities it is found pale from admixture with silver, in others red from the presence of copper.

Native gold is usually found in scales, threads, plates and irregular masses, from a few grains in weight to many pounds. Although generally amorphous, it is frequently found in crystals, which usually assume some modification of the octohedron. Crystals of gold are never found large. Beautiful microscopic octohedra of gold are found in the Ida mine in Inyo county, Cal.

Many substances are mistaken for gold. Some varieties of mica resemble it in certain lights, so much so as at times to deceive the most experienced eye. Chalcocite or copper pyrites or even iron pyrites are sometimes mistaken for it; and wulfenite or molybdate of lead, quite common in Nevada and Eastern California, bears a perplexing resemblance to it. Ores differ from minerals, being composed of two or more minerals in different states of aggregation.

Gold is generally found native or alloyed with some other metal. Very few ores contain it in such form as to be regarded as mineral species, yet gold is found in this native state in nearly all the rocks and formations of the globe. It is one of the most widely disseminated of metals.

It is sometimes alloyed with fully one-half of silver, which was the case in a sample found in the Ophir mine in Nevada.

Rhodium gold is said to contain from 34 to 43 per cent. of Rhodium, but the highest authorities consider it doubtful.

Palladium gold is alloyed with from 5 to 6 per cent. of Palladium.

Sylvanite is a telluride of gold and silver; a rare mineral.

Nagyagit is a telluride of gold, lead and silver, with some copper and sulphur.

Gold is found native in the following minerals and gangues: Pyrites, chalcocite, pyrites, galea, blends, mispickel, tetradymite, native bismuth, stibnite, magnetite, hematite, baryta, fluor-spar, siderite, chrysocolla, opurites and granites. At Moccasin Creek, Tuolumne county, it is found in statistics, and in Plumas county, in obsidian.

Gold is as closely associated with iron in nature as silver is with lead. Probably no specimen of pyrites can be found which will not give at least traces of gold.

There are two methods of assaying gold. The chemical and the mechanical. By the chemical is meant any process by which the gold is made to enter into fusion or is dissolved and recovered to be weighed in a pure state. Chlorination as practiced at Grass Valley and elsewhere is a chemical assay on a large scale.

The mechanical assay is when the gold is obtained as it occurs in nature, and is therefore only approximative. Sluicing, hydraulic washing, milling and open prospecting are examples of mechanical assays on a grand scale. All true mechanical assays as practiced by the assayer or prospector are based upon the same principle.

Although many substances so resemble gold in the rock, yet when pulverized and washed down in a pan or hand spoon, the practiced eye instantly detects the difference. It is a saying among prospectors that "if there is any doubt it is not gold." And I may say here that although I intend to describe all the modes of assay, of gold bearing rock, yet I am firmly of the opinion that this only practical assay of gold is the ordinary method of prospecting by the common pan or horn spoon.

The skillful assayer will find no difficulty in ascertaining the amount of gold in the sample furnished him with the wisest accuracy, but so difficult is the sampling of ore containing gold that all results so obtained are only roughly approximative, and any miner who would venture any investment on the assay of a few specimens from a gold mine must be very ignorant or sadly deficient in judgment; it is my opinion that to assay of ore from a gold bearing mine is of any value unless a large quantity of the ore is sampled, or fifty tons or more properly worked in a quartz mill. The next best assay is a multitude of prospecting tests from various parts of the mine. This mode of prospecting is well understood among miners and mill men, considering which a brief description only will be necessary. As usually practiced a few pieces of quartz are put into an iron mortar and pounded as fine as can be in that rude way. The powdered quartz is put into an iron pan or horn spoon and washed down until only the heavier particles remain, which consist of sulphurets, iron sand, and gold if there is any. This pan is then partly filled with clear water which is caused by a peculiar motion (learned only by practice) to flow over what remains in the pan. Gradually the lighter portions are swept across the bottom of the pan, and the gold is seen as a sort of yellow fringe at the upper edges of the black sand and sulphurets. Some prospectors are exceedingly skillful and will perform the whole process almost in the same time I have consumed in writing it. Some ideas may be gained of the likelihood of the mine "to pay" from the amount of gold found in a number of such assays. It is found that any ore that will always show "the color," will pay to work in almost any part of California.

The process above described can be greatly improved upon by rejecting the iron mortar and substituting an iron plate upon which to pulverize the ore. The pieces of ore are to be laid on the iron plate, which should be at least three feet square, and broken with a hammer into pieces the size of a walnut. Then an iron ring is used to confine the fragments when they are further reduced in size, still using the hammer. The ring should be about three inches in diameter and an inch high; an iron muller is then used exactly in the manner that painters grind paint on a marble slab. The ore will be quickly and easily reduced to a powder, and can be brushed off on a large sheet of paper, an edge rising half an inch on three sides of the iron plate will be found an improvement. The ore should be sifted before washing through a sieve with meshes of 40 to the lineal inch; any portion not passing through the first time may be returned to the plate and quickly reduced to the proper size. As the gold being malleable may be reduced to thin plates by this process, and refuse to pass through the sieve, the last portion must be shaken from the sieve into the powdered ore and washed with it, ore so heated can be washed much more effectually than when it is only partly pulverized, and every particle of gold can be isolated and retained in the dish.

For washing gold, I use an evaporating dish about six inches in diameter, which I find more convenient than either the iron pan or horn spoon. Every mill should be provided with such an iron dish and muller as I have described. It will be found of daily use.

The difference in the fineness of California gold from different localities may be seen in the following analysis made by some of the most celebrated chemists of the United States

and Europe. Prof. J. D. Whitney gives the average fineness from 875 to 905. W. P. Blake states that this average was formerly 885 and has fallen to 865 to 870.

per cent.	Fineness.	per cent.	Fineness.	per cent.	Fineness.	per cent.	Fineness.	per cent.	Fineness.	Total.

## A New Grape Crusher.

Messrs. Schoenstein & Kleiu, two young mechanics of this city, have invented and procured Letters Patent through the Scientific Press Patent Agency for a grape crusher and stemmer, by which grapes taken in clusters from the vine can be crushed and the stems separated from the pulp during the operation. Our Washington agent reports the granting of this patent in the following humorous letter:

We take great pleasure, after our long wrestle with the Examiner to get it, in herewith forwarding the official announcement of the allowance of a patent to Messrs. Schoenstein & Klein for their grape crusher; and we hope it will be in time to use on the crop gathered the present autumn, so, that young California, "elevated" on the products of home vintage, may, in his "gaylarity," more than ever sing:—

"Was not the 'Gallo Widow'  
That turned my foolish brain,  
Nor the wine of any vineyard  
Found in Germany or Spain.

**RAPID SPREAD OF FIRE OVER DRY TIMBER GROUND.**—It seems almost impossible to many who read of the terrible destruction of life by the late fires in the timber regions of Wisconsin, to realize that there could have been no escape for the sufferers from their terrible fate. The difficulty of escape from such fires, however, will be reasonably realized if we accept as correct the statements with regard to the rapidity with which large fires sometimes travel under favorable circumstances for their spread. The Grass Valley Union gives us some information of a fire in the timber near that town, which is said to have traveled two miles in ten minutes, or a mile in five minutes. The Vallejo Chronicle of the 14th inst. speaks of a fire which broke out in the woods near Berryessa Valley, during the Northern of Thursday last, which traveled 15 miles in two hours, or at the rate of a mile in ten minutes. Escape from such fires or anything like such fires, if spread over any extensive tract, at right angles with the line of approach, would be impossible, with even a fleet horse. The above accounts may be exaggerated, but there is no doubt but that a large fire before a high wind, in dry timber, travels with amazing swiftness, by means of the great cloud of burning cinders which always precedes it.

**HONEY IN THE MOUNTAINS.**—The Plumas county National says that quite a large quantity of honey is now found in the woods near La Porte, and bee hunting is becoming a favorite pastime. Since the introduction of bees in this State, our immense forests are gradually being colonized by these industrious honey manufacturers, and such is the mildness, as well as the geniality of our climate, that they will multiply rapidly, and our land before long, like that of ancient Canaan, will be overflowing with honey, if not with milk.

**PREVENTING BEES FROM MIGRATING.**—One of our bee-keepers prevents his swarms from leaving his premises by killing all the "queens" but one in each hive, and then clipping one wing of each. If they then attempt to leave, they go no faster than the queen travels on foot, and are consequently easily hived. We are not sure whether this "cruel dodge" is new or not.

## USEFUL INFORMATION.

## Hints to Carpenters.

The *American Builder* believes that there is much labor in vain in the ornamentation of houses, especially wooden houses. It tells carpenters, before making and fixing a quantity of ornament, to be sure that it is good, and goes on to say: There are many things that you do, and many others that an architect—if there be one in the case—will often instruct you to do, which are neither tasteful nor in good construction. Of course there are exceptions. You may be sure of this, however, that the more elaborate with ornament and carving a building is, the more you are going on the wrong track. Real beauty consists not in added features but in the body of the work itself, and this fact should always be borne in mind.

The principle of carving wood for outside ornament is wrong. We would not say it is to be discarded altogether, but, still, we have that leaning. Cut work, and that of the simplest kind, is the best. Complexity in forms and ornament are mostly bad. It not only requires unnecessary labor to produce, but there is actually vexation in the mind of the spectator. When people see a thing that is crowded with intricate work, that it takes them trouble to make out, it is tolerably good evidence that such work is not exactly what is wanted.

Give great attention to the sizes and proportion of doors and windows, and pay especial attention to the construction; and never, if possible, conceal its principles, but let them form the basis of ornament. Moldings, cornices and miters are not to be put in exposed positions. It is surprising what an excellent effect can be produced by cutting, even with little or no molding or carving about a ship. How plain, yet how beautiful it is, simply because of its proportions and because—it looks like work.

## How Samuel Williston Made His Fortune.

The first manufacturer of buttons in the United States was Samuel Williston. While he was dragging along as a country store-keeper—his eyes having failed him while studying for the ministry—his wife thought her that she could cover by hand the wooden buttons of the time, and thus earn an honest penny. From this the couple advanced in their ambition until they had perfected machinery for covering buttons, the first employed for the purpose in the United States. From this sprang an immense factory, and then others, until Samuel Williston made half the buttons of the world. His factories are still running at Easthampton, coining wealth for the proprietor, and known to every dealer in buttons the world over. He is now between seventy and eighty years of age, is worth five or six million dollars, and has given \$400,000 to Easthampton, for a seminary and for churches, \$200,000 to South Hadley Female Seminary, and \$200,000 to Amherst College, besides lesser gifts.

**TO PREVENT THE MOULDING OF GUM ARABIC.**—It is well known that solutions of gum arabic soon become mouldy, and eventually sour, and finally lose all adhesive properties. To prevent this it has been customary to use creosote, carbolic acid, corrosive sublimate and other poisonous disagreeable agents, the cost of which, or their unpleasant character, has deterred persons from using them. We now see it stated that sulphate of quinine will serve the same purpose, without itself imparting any bad odor. The addition of a solution of a few crystals of this salt to gum arabic will prevent the formation of mould quite as effectually as carbolic acid, and by analogy it is safe to suppose that the same salt could be used in writing ink, mucilage, and possibly glue.

**SMOKERS** will be pleased to learn that large deposits of meerschaum have been discovered in Patagonia. Heretofore the supply of this material for pipes has been limited, the clay being found in Turkey, Greece, Asia Minor and the shores of the Mediterranean, in small quantities. A great many people fancy that their pipes are real "hydrous silicate of magnesia," that being the scientific name for the genuine meerschaum, when they are made of common clay colored, or of bread, and are foul with the fortieth smoking. As meerschaum are the healthiest pipes possible, the Patagonia discovery is to be rejoiced at.

## What are Rose Diamonds.

Rose diamonds are so called on account of the form in which they are cut, and were until lately but little used, except in the smaller sizes, to place in fittings where the space or depth was too small to admit of a brilliant being employed. The rose-cut diamond has however lately again come into fashion, and the prejudice which has been entertained against them arises in a great measure from the ignorance of the purchasers, who, when told that such a stone is a rose, imagine it to be no diamond, being unaware that roses and brilliants are identically the same stone cut into different forms.

The rose-cut diamond is very lively, and makes a great display at a small cost, roses being manufactured from pieces of "rough," which from their thinness are incapable of forming brilliants. They are infinitely more lustrous than those stones called spread brilliants, which, from their want of depth, are lustreless and glassy. The smaller sizes are sold in packets containing generally 500, and have to be handled with great care, as the breath suffices to blow them away, and the delicate edges are very liable to break. They have sometimes been made so small as to require 1,500 to weigh one carat; and, when the number of facets on each is considered, the delicacy and minuteness of the work may be imagined.

Roses are still sometimes used for watch jewelling, but rubies are now preferred. Large rose diamonds fluctuate considerably in value, and their price can never be depended upon. They are not much esteemed in Europe, and it would be impossible to give any precise value, although they are supposed to be worth as much as brilliants of the same weight.

The small rose diamonds, if under 40 to the carat, are worth 47 cents to \$2 25 each; and above that size and up to one carat, they fetch from \$59 to \$72.18 the carat. In the Green Vaults at Dresden, and in the treasure chamber at Vienna, may be seen some very large and fine rose diamonds.

## Queer and Vicious Fish.

Among the vast multitude of living beings which inhabit the waters of the globe, there are things beautiful, things ludicrous, and things horrible and fearful, beyond the power of pen to describe. Among the latter class may be included the scorpion fish, which, upon the authority of Dr. Francis Day, is so much feared and dreaded, that fishermen will cut the meshes of their nets, and lose their entire catch, rather than risk a wound from it. The fish inflicts its injuries by its dorsal fin, which is serrated, and until this is broken by means of a club or stick, no one acquainted with the character of the fish will venture to touch it with the hand. Another fish, called the crocodile fish, also inflicts frightful wounds with its spine. A fish is said to infest the mouth of the Amazon, which, although scarcely larger than the minnow of our fresh water streamlets, is so ferocious in its attacks upon the human body that it is dreaded even more than the crocodiles. The name of this little fish fiend is "candiru," and when it seizes hold of the flesh, which it never fails to do when occasion offers, it holds on with such a tenacity that it cannot be removed without tearing out a mouthful of flesh. Another fish of South American rivers is the "payara," which carries in its lower jaw two fangs, by which it cuts a gash as smoothly as could be done by a razor. The "caribe" is the vampire of South American streams. It scents blood so keenly, that the least scratch on the person of the bather invites its fierce attacks. It has sharp triangular teeth of great power, and, though no larger than the perch, is an object of dread to all who know its fierce character.

**RED NOSES.**—The French journals say that the Parisians are jubilant over the late discovery of Dr. Bernsie for the relief of red noses. By means of electricity he has restored a lady of rank to happiness, and changed her nose, a blooming rose, into a delicate lily.

THERE is on exhibition at the Institute Fair, in New York, a stone-center emery wheel, which is said to weigh two thousand pounds, the largest emery wheel ever known to be made.

THE most perfect lubricator is said to be pure plumbago, manufactured by the American Graphite Co.

## GOOD HEALTH.

## Take Care of the Liver.

A liver secretes each day about two pounds of bile, which contains a great amount of waste material taken from the blood. When the liver becomes torpid or congested, it fails to eliminate this vast amount of noxious substance, which therefore remains to poison the blood and be conveyed to every part of the system. What must be the condition of the blood when it is receiving and retaining each day two pounds of poison? Nature tries to work off this poison through other channels and organs, the kidneys, lungs, skin, etc.; but these organs become overtaxed in performing this labor, in addition to their natural functions, and cannot long withstand the pressure, but become variously diseased.

The brain, which is the great center of vitality, is unduly stimulated by the unhealthy blood which passes to it from the heart, and it fails to perform its office healthfully. Hence the symptoms of bile poisoning, which are dullness, headache, incapacity to keep the mind on any subject, impairment of memory, dizzy, sleepy, or nervous feelings, gloomy forebodings, and irritability of temper.

The perspiration becomes so irritating and poisonous that in connection with the vitiated blood, it produces discolored brown spots, pimples, blotches and other eruptions, sores, boils, carbuncles and scrofulous humors. The stomach, however, and other organs, cannot escape becoming affected, sooner or later, and costiveness, piles, dropsy, dyspepsia, diarrhoea, and many other forms of chronic disease, are among the necessary results.

How important then that the closest attention should be paid to the condition of the important organ named. Whenever any of the above symptoms are observed, go to your physician at once and get his advice.

## Bad Blood.

Draymen about breweries drink quarts, if not gallons of beer every day, and by the time they are forty-five, the commonest scratch of a pin on the hand will not get well for months; if the skin is abraded or scraped off by a misstep or other accident, a running sore is sometimes established for the remainder of life; it is because the blood is bad; it is poor, too thick, and even poisonous.

Persons have poor blood when it is observed that scratches and cuts and bruises are a long time in healing; and this should be a friendly warning to correct that condition of things, because it shows there is but little vitality, little stamina, and disease of some kind is impending, especially of the typhoid type, and recovery will be slow, doubtful, and in many cases not possible.

The first step to be taken in all cases to get rid of bad blood, is to spend a large portion of daylight out of doors in remunerative labor or agreeable employment, or journeying, on horseback being the best; this helps nature to work the bad blood out of the body, and at the same time gets up a good appetite and a vigorous digestion, which makes a poor blood to supply the place of the bad, and the man is well, without an atom of medicine or a dollar's expense.—*Hall's Journal of Health.*

**THE USE OF BUTTERMILK.**—Persons who have not been in the habit of drinking buttermilk consider it disagreeable, because it is slightly acid. There is not much nourishment in buttermilk, but the presence of the lactic acid assists the digestion of any food taken with it. Buttermilk is an excellent substitute for fruit in Winter, and is also very good in the spring toward keeping off that unpleasant complaint known as spring sickness. The Welsh peasants almost live upon oat-cake and buttermilk. Invalids suffering from indigestion will do well to drink buttermilk at meal times.

**BURNS AND SCALDS.**—Every family should have a preparation of flaxseed oil, chalk and vinegar, about the consistency of thick paint, constantly on hand for burns and scalds. A noted retired physician states that he has used it in hospital and private practice for the past forty years, and believes that no application can compare with it, as regards relief of pain and curative results.

**CHILDREN** of a weak and scrofulous habit should be allowed all the white sugar they desire. It improves digestion and strengthens the blood.

## Something About Teeth.

Why do some people's teeth come out more readily than others? The reasons for this are probably many. About the middle of last century Peter Kalm, a Swede, visited America and wrote sensibly about what he saw. He observed a frequent loss of teeth among settlers from Europe, especially women. After discussing and rejecting many modes of explanation, he attributed it to hot tea and other hot beverages; and comes to a general conclusion that "hot feeders lose their teeth more readily than cold feeders." Mr Catlin, who some years ago had an interesting exhibition of Indian scenery, dresses, weapons, etc., noticed that North American Indians have better teeth than the whites. He accounts for the difference in this strange way, that the reds keep the mouth shut, whereas the whites keep it open. The teeth, he says, require moisture to keep their surfaces in good working order; when the mouth is open, the mucous membrane has a tendency to dry up, the teeth lose their needed supply of moisture, and thence come discoloration, toothache, tic-doloureux, decay, looseness, and eventual loss of teeth. Mr. Catlin scolds the human race generally for being less sensible than the brutes in this respect, and the whites especially in comparison with the red. We keep our mouths open far too much. The Indian warrior sleeps, hunts and smiles with his mouth shut, and respire through his nostrils. Among the virtues attributed to him to closed lips, one is excellent—when you are angry, keep your mouth shut.—*Chambers' Journal.*

**FEAR OF DISEASE.**—The fixed idea of having heart disease, or other complaints, is a very common one. Physicians can easily tell whether the heart is right, just as you can hear whether a clock is right by its tickings and beatings. There are other very sure symptoms, well known to the profession. Many persons also fear they have a cancer in the stomach or liver; or a tapeworm, or some other dreadful malady; but generally these fears are the result of a disordered imagination, and groundless. People do a great wrong to themselves and their friends by giving way to and dwelling upon such ungrounded fears.

**LEAD IN WATER.**—The question is often asked:—"How small a quantity of lead in water will produce serious consequences?" According to the *Herald of Health* the one hundredth part of a grain to the gallon, when used for a long time, has been known to produce paralysis. As a general rule, however, such a small quantity does not produce any perceptible disturbance to the system. It is dangerous, however, to drink water, for any length of time, with one-twentieth of a grain to the gallon.

**DEATH FROM MULBERRIES.**—Five persons have recently been found dead in Mississippi under mulberry trees. Death in all these cases has been attributed to eating mulberries which have been impregnated by locusts. In the stomach of one colored boy, says the *Woodville Republican*, was found a quantity of mulberry seeds and the locust eggs. Two children in Williamson County are also reported to have died from eating plums similarly impregnated.

**MEDICAL PROPERTIES OF COCOANUT MILK.**—In India, according to a writer in the *London Pharmaceutical Journal*, the milk of the cocoanut is employed in debility and incipient phthisis, as a substitute for cod oil, with excellent results. It is also used, instead of cow's milk, in tea and coffee. In large doses, it acts as a substitute for castor oil.

**WIND IN THE STOMACH.**—A physician, in a very sensible article on bathing, recommends a more general use of warm baths instead of the syrups and worse nostrums for the wind in the stomach, which is thought to be so often the cause of the worrying restlessness of the very young.

**TO DISGUISE CASTOR OIL.**—Rub up two drops oil of cinnamon with an ounce of glycerine and add an ounce of castor oil. Children will take it as a luxury, and ask for more.

**TO PREVENT DISCOLORATION FROM BRUISES.** Apply repeatedly cloths wrung out of hot water or the tincture of arnica.

Indifferent Metallurgy; On the Assay of Gold; New Grape Crusher; Rapid Spread of Fire over Dry Timber Ground.....	262
USEFUL INFORMATION.—Hints to Carpenters; What are Rose Diamonds? Queer and Vicious Fish; Good HEALTH; Take Care of the Liver; Bad Blood; Something About Teeth; Lead in Water.....	263
Chemistry of the Washoe Process; Annual Report of the Eureka Mine.....	264
California Gold Mines; Wingard's New Construction of Vessels—III.; Decease of Distinguished Scientists; NOTICES OF RECENT PATENTS.....	265
Domestic Economy; Domestic Receipts; Mechanical Hints; Life Thoughts.....	266

**IRREPARABLE LOSS.**—One of the greatest losses to the public by the recent fire which destroyed a large portion of the city of Chicago, was the destruction of the library of specifications of British patents, consisting of 1,500 large volumes. This loss will be more severely felt for the reason that it is impossible to replace the library, as the British Government have disposed of the last set of Reports that they can spare. There still remains in the United States, a library of these Reports in the following institutions: United States Patent Office, Washington City, D. C.; Astor Library, N. Y.; State Library, Albany, N. Y.; Franklin Institute, Philadelphia; Free Library, Boston; Philadelphia Library Co.; Peabody Institute, Baltimore; Historical Society, Madison, Wisconsin; Cornell University, Ithaca, N. Y.

**NO USE FOR SQUIRREL SKINS.**—A subscriber writes us from Sacramento, enclosing a clipping from a newspaper in which it is asserted that there are parties in this State buying squirrel skins for the manufacture of gloves, etc. We have already, several weeks ago, pronounced the item without foundation. Glove-makers have no use for squirrel skins; they are too small for such or any similar manufacture. Farmers will do well to keep on killing the squirrels; but they will lose their time when they preserve their skins in the hope of a sale for the same.

**ANTIMONIAL ORE** to be marketable, must contain at least 60 per cent. of antimony. If of good quality, that yielding from 65 to 70 per cent. will find a market at from \$37.50 to \$42.25 per ton on the usual conditions of ore shipment.

## CHEMISTRY OF THE WASHOE PROCESS.

[Concluded.]

### VIII—Mercury with other Metals.

Mercury and iron, under the proper conditions, undoubtedly are the principal agents in the extraction of the precious metals by the Washoe method. The results depend, however, in a great measure, upon the mechanical treatments employed in pulverizing the ore very finely and in maintaining, with a proper degree of consistency, a constant agitation of the entire mass; the essential conditions of the amalgamation being that the mercury should be thoroughly incorporated in the pulp and every particle of the reducible minerals brought into direct contact and triturated with the metal. The mercury should also always retain a bright, clean surface, free from any coating of metallic salts, such as calomel or sulphate of lead, and any coating of oil or grease. The slightest tarnish appears to retard greatly its activity. The iron seems to act as an electro-chemical agent, the immediate contact of the two metals, aided by heat and friction, causing a local electric current, which adds to the amalgamating energy of the mercury.

Mercury, when perfectly pure, does not apparently amalgamate or decompose other bodies so readily as when holding a minute quantity of some foreign metal in solution. It would appear that the yield of gold is increased by the presence of silver; also that the latter metal is more readily extracted if a considerable portion of amalgam is already present. Some state that silver is better absorbed when copper is employed, and as the former is amalgamated the latter is expelled. Both iron and copper cause the formation of copper amalgam. On the other hand, sulphate of copper exhibits a tendency to drive out lead and also, according to Karsten, zinc and antimony. Sodium amalgam rapidly attacks gold, silver and silver compounds, yet its practical application did not give results which would warrant its general introduction.

Although the presence of a small quantity of several metallic bodies enhances the amalgamating energy of mercury, yet a slight excess sickens it. The peculiar phenomena attending the mercury, by which both electro-positive and electro-negative metals are absorbed, and the effects which they produce in increasing or neutralizing its action, are very little understood.

### IX—Loss of Mercury.

The loss in quicksilver during the operation arises from two sources, one mechanical, the other chemical. The latter is occasioned by the formation of the chlorides of mercury, which escape with the tailings.

In the patio process the chemical loss is often very considerable, large amounts of salt and magistral being present but no agent to reduce the calomel formed. The loss is said to increase in proportion to the richness of the ore in silver sulphurets, owing to the fact that for every atom of chloride of silver reduced by the mercury a corresponding atom of the latter metal is consumed as sub-chloride.

In the Washoe process the chemical loss would seem to be small in proportion to the whole consumption. This is probably due to the effects of the iron, which combines with the chlorine of the calomel, setting the mercury free.

The more the metal is ground, the more it must be cut up and the greater the difficulty in recovering it. Now, if the consumption of iron is assumed to measure the grinding effect of the pan, the relation between loss of mercury and loss of iron should be, in a certain degree proportional. The following table, compiled from the results of several mills, furnishes some in-

teresting details in regard to the loss of mercury. Part I shows that it is independent of the consumption of chemical agents. Part II that it is in some measure dependent upon the consumption of iron in the pan.

PART I.					PART II.				
Tons of Ore.	Foundry Sulphate of Soda.	Foundry Sulphate of Iron.	Foundry Sulphate of Copper.	Foundry Sulphate of Zinc.	Tons of Iron.	Foundry Sulphate of Iron.	Foundry Sulphate of Copper.	Foundry Sulphate of Zinc.	Foundry Sulphate of Lead.
4,400	0.33	0.15	1.54	8.79	9.42	1.54	1.54	1.54	1.54
8,605	0.33	0.15	1.54	8.79	9.42	1.54	1.54	1.54	1.54
4,713	0.23	1.52	1.34	8.29	9.42	1.54	1.54	1.54	1.54
35,000	9.00	3.00	1.33	7.50	9.42	1.54	1.54	1.54	1.54
7,223	1.33	1.33	1.33	7.14	9.42	1.54	1.54	1.54	1.54

The following is an analysis of some artificial crystals of Washoe amalgam:

Mercury.....	75.04
Silver.....	24.18
Gold.....	.77

They have very nearly the composition of 3 atoms of mercury to 1 of silver.

### X—Concluding Deductions.

From the foregoing considerations of the principal features of the Washoe process it appears:—

That the ore consists chiefly of native gold, native silver and argentiferous sulphurets, associated with varying proportions of blende and galena.

That the action of chloride of sodium (salt) and sulphate of copper in the pan produces chloride of copper.

That the presence of metallic iron necessarily causes the formation of the sub-chloride of copper.

That both the chlorides of copper assist in the reduction of the ore by chloridizing the sulphurets of silver, and in decomposing the sulphurets of lead and zinc.

That sulphate of copper enhances the amalgamating energy of mercury by causing the formation of a small quantity of copper amalgam. It also tends to expel the lead.

That notwithstanding the importance of chemical agents, as above indicated, the quantities added to the pulp in the ordinary practice of Washoe mills are too small to give any very beneficial results.

That mercury and iron, aided by heat and friction, are the principal agents in the extraction of the precious metals by the Washoe process.

That the essential conditions in the amalgamation of the gold and silver are that the mercury be kept perfectly bright and pure, in order to produce a direct contact of that metal with the iron and sulphide of silver.

That the consumption of mercury in the Washoe process may be considered chiefly a mechanical and only to a limited extent a chemical loss.

### New Mineral Discoveries.

**RICH STRIKE IN PLUMAS.**—We learn that considerable excitement exists in Mohawk Valley and vicinity, over a strike in quartz. The character of gold in the surface diggings indicated the existence of a ledge near by and on prospecting a vein of quartz two feet wide was found. The shaft is down 15 feet and the lode is increasing in width and richness. The rock all shows free gold in profusion. Quite a number of persons are prospecting now, and it is probable that a new and valuable quartz district will be opened.

**GOLD IN THE STREETS.**—A rich quartz ledge has been discovered in the main street of West Point, Calaveras county. The discovery is creating considerable excitement.

**GOLD IN SAN DIEGO COUNTY.**—A. J. Talbott reports having discovered a ledge near the Colorado river, in San Diego county. Samples of ore from the vein have an estimated assay value of \$200 per ton in gold. The lode is said to be eight feet wide.

**WILLIAM E. BARRON**, well known from his connection with the mining and commercial interests of California, and one of the proprietors of the Almaden quicksilver mine, died at his residence in this city, on the 25th inst.

## Annual Report of the Eureka Mine.

The Annual Report of the Eureka Gold Mining Co. of Grass Valley, Nevada Co., Cal., for the fiscal year ending Sept. 30th, 1870, has been laid on our table. This mine has long been favorably known as a very productive gold quartz lode, though recently the grade of ore has been very low.

The report of Superintendent Watt for the year ending Sept. 30th, shows 17,447 tons of quartz extracted. The amount of ore crushed was 18,560 tons in 305 running days with a 30-stamp mill. Only 15 stamps are now being used on account of a scarcity of water. There were 950 feet of drifting and cross-cutting made. The main shaft is sunk 849 feet on the ledge, or 786 feet vertically, of which 120 feet was sunk and timbered during the past year besides re-timbering 110 feet and sinking 200 feet of winzes. From the financial statement of the Secretary, we condense the following:

Receipts, including cash on hand, bullion, sulphurets, etc., \$651,708. Disbursements, including mining and milling account, etc., \$625,840, of which \$360,000 were paid out as dividends to stockholders. The company have no liabilities and the assets aggregate, with cash on hand, \$127,477. The average yield of the ore for the year was \$30 per ton, and of this sulphurets, \$158.23. There were 275 tons of sulphurets worked during the year. The average cost of mining the ore was \$8.82, and the average cost of milling, \$2.02, or a total of \$10.84, leaving a profit of \$19.16 per ton. The average cost of concentrating sulphurets was \$15.88, and of reducing the same, \$22.19, or a total of \$38.04, leaving a profit of \$120.19 per ton. The net profits on the operations of the mine for the year were \$330,763, or nearly \$30,000 less than was paid in dividends, showing a draft to that extent on the surplus carried over from the previous year. The mine went into operation on the 1st of October, 1865, since when the receipts have been \$3,382,343, of which \$3,363,234 was from bullion taken out. The disbursements for the same period were \$3,342,495, of which \$1,694,000 was in dividends to stockholders, \$133,105 for construction, \$1,219,492 for mining, milling and other current expenses, and \$295,898 for mines.

No dividends have been paid since July, and there is no immediate prospect of a resumption of dividends. On the 1st inst. there were 85 tons of quartz on the surface and 950 tons broken in the mine, ready for hoisting, the value of which, as put down in the assets, is \$9,129. The Company hope to crush a sufficient quantity of ore to meet current expenses until new bodies can be discovered and opened.

### Notes on Contributions to our Cabinet.\*

No. 529.—Is a piece of native copper from the Central Pacific ledge, Snecor Mining District, Utah Territory, about 4½ miles from Tecoma, on C. P. R. R. The lode at present looks to be of great value, and the piece of copper sent us is most assuredly a beautiful specimen.

No. 530.—This is a specimen of argentiferous galena from the "Mountain Sheep" lode, within a few feet of the lode above mentioned. It is rich in silver and lead, but is otherwise not particularly remarkable. Both specimens are with the compliments of Mr. Jas. Campbell.

\*Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and placed in our cabinet. A full account of the place, occurrence, etc., adds much to the value of such specimens.

Our first page illustration last week, should have been credited to our excellent cotemporary, the *American Artisan*.

## California Gold Mines.

[Written expressly for the Press.]

It is but recently that Quartz Mining in California has been considered strictly a legitimate business. Hitherto it has been looked upon by capitalists and business men as *extra hazardous*, but by improved systems of working, both mines and ores that a few years ago paid "Irish dividends" are now made to pay handsome profits; shrewd business men are now on the lookout for, and investing daily, in our California gold mines. The experience of 20 years has taught us, that mining should be conducted with a strict regard to economy, and that inexperienced men as managers of mining properties, are bad pilots to successful issues; it is to-day the paramount interest of the State, and the gold-product will soon be largely in excess of all other industries.

It is a trite old adage that "it is an ill-wind that blows nobody good." I truly sympathize with the sufferers by the late fires in the Atlantic States, but the lesson will be sure to teach our capitalists and business men that there are other and safer investments than bonds, mortgages, bank and insurance stock. Floods destroy real estate—a Government patent will not hold it—cities, towns and fire-proof buildings burn down—insurance policies will not cover the losses; bank and insurance stock cannot always be realized on; while a good mine, well administered, neither burns down or bursts up. I was forcibly reminded of this a few days since, when a prominent mine-owner of one of the best mines in this State, came down to adjust his losses, the earnings of his mine for the past ten years, amounting to \$250,000, had all been swallowed up. By the advice of a shrewd business friend of his, he invested in insurance stock and lost, he told me that he had his mine left yet, but no more so-called legitimate investments for him; henceforth his surplus earnings would go into Mines.

Having been in this country since '49, and identified with its interests, both mineral and agricultural, I have been a close observer of the fluctuations and changes in the several interests of placer and vein mining, in prosperity and adversity; farming lands and real-estate in cities, at fabulous prices and sold for a song. At one time, stock-raising was considered the most prosperous and profitable business in the country; a drouth followed, and the stockmen were ruined. To-day, mining bids fair to be the paramount interest, when all fails "we go back to our first love," who has remained true to us, and receives us kindly; this branch of business has undoubtedly been much neglected, but is now being revived in all our mining counties. We hear daily of new mines discovered and old mines re-opened, proving profitable investments. As an illustration, I will cite Placer County, only twelve months ago one of the most demoralized and played out counties in the State, grass growing in the streets of the county seat—Auburn—when one of our prominent citizens, a live man and a judge of mines, passing through the county, was asked to look at some mining properties; he looked, and invested in the "St. Patrick," which has proved a success. Other mining enterprises were inaugurated. Real estate advanced 300 per cent., and mine owners soon found ready sale for properties known to have values, but valueless to the holders, they neither having the means or ability to work them. I had occasion recently to visit Auburn, and was agreeably surprised at the change a few short months had made. I will particularize one of the many prosperous mines that were being developed, as it used to be an old favorite of mine in early days, and has paid me many a big dollar. It was then known as the

Buckeye.

with a parallel lode 30 feet distant called the "Big Vein" or the "Elizabeth."

It used to be worked by shafts from 30 to 50 feet deep, or until water or hard rock was reached, then the shaft would be abandoned and another sunk. In that way it was prospected or worked, for about 1,600

feet in the two veins to the depth stated; the ore taken out paying from 30 to 100 oz. per ton by Arastra reduction. The Fraser River excitement broke out and the owners all sold out or abandoned their claims. Fred. Jones, formerly of Grass Valley, with some San Francisco capitalists, recently bought the entire hill containing eight parallel lodes within a compass of 300 feet at right angles, and extending on their line of strike 2,500 feet easterly and westerly, dipping northerly; all true fissure-veins cutting the formation, which is gneiss (diorite) and metamorphic slate. The veins are small, say from 12 to 30 inches thick, but carry uniform ore of a very high grade, working by mill-process from 35 to 50 oz. per ton. The concentrated sulphurets assay from \$434—the lowest—to \$17,000 per ton. The superintendent, Mr. F. Jones, has inaugurated systematic workings by shafts and levels, and erected good hoisting works, etc., in fact has made a mine of what

## Wingard's New Construction of Vessels.

It has long been a recognized fact among engineers, ship-builders, and sailing-masters that a flat-bottomed or scow-shaped hull for a vessel under certain circumstances of construction, the secret of which was a mystery, was better suited for fast sailing than the ordinary deep and sharp model now used. This was sufficiently proven by the P. M. Randall, the vessel which held the position of the fastest sailer on the waters of our bay, and which in every race out-eailed the finest modeled vessels which were pitted against her for speed.

Mr. Wingard believes that he has discovered the secret of constructing the scow-shaped hull, upon fixed and permanent rules, so as to combine the natural

DIAGRAM OF THE BELLEVUE MINE.

was only holes in the ground; he invited me to go through; I went, and what I saw is shown in the accompanying diagram.

Since purchasing he has taken out and milled 200 tons of ore, which was extracted at an expense of \$8 per ton and paid \$35 per ton. He has nearly 400 tons on the dump ready for milling that he estimates as worth \$40 dollars per ton. He is driving an adit level from Doty's ravine (now in 123 feet with 50 feet of backs) on the "Elizabeth lode" 30 feet from the Bellevue mine north, parallel with it and 1,500 feet from the main shaft of the Bellevue on the line of strike of the lode. This level when oppo-

advantages of the flat-bottomed hull with those of our sharper built vessels.

The engravings presented herewith represent his plan of construction. The forward end of the boat may be provided with two or three cutwaters and the intermediate space between them is hollowed out upon an incline, so as to extend a short distance toward the middle of the bottom, where it gradually merges into the flat-bottom as shown. The cutwaters are constructed upon fine lines, and the intermedi-

WINGARD'S NEW CONSTRUCTION OF VESSELS.

site the Bellevue shaft will drain the eight mines to a vertical depth of 175 feet. A cross cut driven north and south will tap all the lodes and furnish many thousands of high-grade ores. I visited this level and in the face or end of the drift broke from the vein which was from six to eight inches thick, and what is known as ribbon rock, rich specimens containing more gold than quartz; the parallel ribbon adjoining showed bunches of wire and horn silver, then came a ribbon of massive sulphurets, containing galena, blue sulphurets, silver, and sulphurets of iron; so much for knowing how to work a mine. The formation is kindly, country rock easily worked, drifts driven for \$6 per foot and shafts sunk for \$12 per foot. I particularize this as a notable instance of a successful mining enterprise. But a few months ago the mine had no apparent value; to-day its values assume mammoth proportions. This is no isolated instance, there is not a mining county in the State that has not more or less now abandoned mines that could be made to show as good results as the Bellevue.

ate channel is made on regular curves so that as the vessel advances the water will be drawn through the channel to the middle of the bottom and thus buoy up the vessel. The stem of the boat is provided with two cutwaters with an intermediate channel which serves to free the water from under the vessel. In seagoing vessels three of the cutwaters at the forward end will be preferable as the center one will serve to break the force of a quartering wave.

The general appearance of one of these vessels, when seated in the water, will be equally as pleasing as the ordinary deep hulls, as its outline can be made upon regular and uniform curves.

Vessels of this construction are more particularly adapted to the shoal waters of our inland rivers on account of their light draught.

By thus constructing the hulls of vessels

there will be less displacement of the water, and consequently less resistance to the forward progress of the vessel, and by being constructed upon sharp lines and in the peculiar manner above described, it is anticipated that it will be capable of carrying a greater weight with increased speed and draw less water than vessels of the ordinary construction. A patent has been obtained for this invention through the SCIENTIFIC PRESS Patent Agency, by Adam Wingard. For further information address the patentee, T. B. Wingard, 318 California street, San Francisco, Cal.

## Decease of Distinguished Scientists.

We are called upon, this week, to announce the death of two leading men in the scientific world:—Charles Babbage, the eminent mathematician and Sir Roderick Murchison, the great geologist, geographer, and natural philosopher.

SIR RODERICK I. MURCHISON, was born at Faradale, Ross-shire, Scotland, in 1792. He received a portion of his education at the Durham grammar-school and entered the military college at Marlow, in 1805, leaving it two years subsequently on receiving a commission in the army. In 1828 he accompanied Sir Charles Lyell in a geological tour among the extinct volcanoes of Auvergne. After exploring the Eastern Alps he published a memoir on the subject, accompanied with a geological map in 1829. In 1835 and 1839 he explored the Rhenish provinces, and in 1840, in company with Mr. de Verneuil, a French geologist, he set out for Russia to investigate the geological formation of that country, hitherto very little known.

He published the result of his several expeditions in a magnificent volume, entitled "Geology of Russia and the Ural Mountains." His principal work, and that best known to the American public, is "Siluria: the History of the oldest known Rocks containing Organic Remains, with a brief sketch of the Distribution of Gold over the earth," published in 1854. He predicted the existence of gold mines in Australia long before they were discovered. His hypothesis of the configuration of the African continent received confirmation by the discoveries of Dr. Livingstone.

Sir Roderick Murchison was at the time of his death President of the British Geographical Society and Director-General of the Geological Survey, as well as a member of various scientific societies throughout the world. He always manifested great interest in the Gold Fields of California and took much pains to gather information on geological subjects connected with our State.

CHARLES BABBAE is best known as the inventor of a calculating machine, which is intended to substitute for mental calculation, the more precise principle of mechanism. After a tour in Europe with a view of studying the various pieces of mechanism employed in the arts, he published his "Economy of Manufactures and Machinery." He was appointed, in 1828, Professor of Mathematics at Cambridge University. He introduced his calculating machine in 1833, and its value may be estimated from the fact, that a table of logarithms of all natural numbers, ranging from 1 to 100,000, was produced, free from error, by its agency. Mr. Babbage was a member of nearly all the learned societies of Europe and America. He was one of the founders of the Royal Astronomical Society, and of the British Association for the advancement of science. *Omnes una manet nox et calcanda semel via leti.* "There remains a common night to all, and the path of death must by all be trod."

SEEDING COMMENCED.—A large number of farmers have been engaged in dry sowing on the light, dry soil of the San Joaquin Valley for the last three weeks.

## DOMESTIC ECONOMY.

### Coffee Should be Drank Without Milk.

According to the Société Impériale et Centrale d'Agriculture de France, coffee is an excellent aliment which suits most ages, temperaments, and constitutions, and of easy digestion when its consumer is in good health; it is also known that black coffee without milk is a stimulant and tonic whose intervention is advantageous after a repast to facilitate digestion.

Milk is undeniably wholesome and nutritious. Milk and coffee taken separately, not to interfere with each other in the stomach, are excellent; but, what is remarkable, when mixed and taken together they constitute a new composition which is absolutely indigestible.

This requires an explanation: The skin of animals is a nitrogenous matter which by boiling becomes a digestible product; if it be put in a fresh condition in contact with tannin it is converted into leather, when it may no longer be turned into alimentary aliment; no amount of boiling will do it. Gelatinous substances, put in contact with the tannin, are affected like the skin; they unite with it and acquire the property of resisting the effect of the gastric juice.

Now the infusion of coffee is rich in tannin, hence its mixture with milk has the immediate result of transforming the caseous part and the albumen that it contains into a kind of leather, undecomposable and indigestible, like that made in a tan pit. The composition thus produced remains in the stomach until new aliments come to displace and force it through the lower orifice of the stomach into the intestines. The sugar and bread with which this mixture is charged digest all the same, as well as the gelatinous substances, if the coffee is not used in such quantity as to render them inert.

The stomach is thus ballasted with a kind of thin milk, in which the gastric juice that it secretes constantly is quickly diluted in weakening its stimulating action on the membranes from which it comes, and the result is that the want of food makes itself more slowly felt; for this want, in general, is only developed when the stomach is empty. The consumer is thus deceived by the feeling of his stomach.

The use of this mixture is sometimes attended with disagreeable results. Those who are not accustomed to it frequently undergo a purging through indigestion, and those who are, often eventually have inflammation of the stomach or one of the maladies to which this organ is subject under the abuse thus put upon it. Women especially, from their delicate organization, suffer in the consumption of coffee with milk. To dissuade them from its use it would be well to make them understand that coffee with milk is nothing in reality but *leather soup*.

**TO CLEAN CARPETS.**—Shake it well; tack it down, and wash it upon the floor; the floor should be very clean; use cold soap suds; to three gallons add half a tumbler of beef-gall; this will prevent colors from fading. Should there be grease spots, apply a mixture of beef-gall, fuller's-earth, and water enough to form paste; put this on before tacking the carpet down. Use tacks inserted in small leather caps. In sweeping carpets use a soft brush. When it can be done, use straw matting (not straw) under the carpets; they last much better. Cover bricks with carpeting; put behind doors to prevent the knobs of locks striking against walls.

**FRENCH MODE OF FRYING POTATOES.**—Cut them in whatever shape you wish, above a bowl of cold water, so they will drop into it. Then drain and wipe them dry. This must be done quickly, so as not to allow the potatoes to become reddish. Have a coarse towel ready, then turn the potatoes into a colander, sprinkle salt on them, and serve hot. If you wish them light or swelled, leave the potatoes in the colander only about half a minute, then put them back in the very hot fat, stir for about a minute, and put them again in the colander. If the fat is very hot, when dropped into it for the second time, they will swell.

**CLEANING TINWARE.**—An experienced housekeeper says the best thing for cleaning tinware is common soda. She gives the following directions:—dampen a cloth and dip in soda and rub the ware briskly, after which wipe dry. Any blackened ware can thus be made to look as good as new.

### Horse Meat in Paris.

Horse meat was largely used in Paris several years before the late siege of that city. M. Duroix states that in July, 1866, horse meat was allowed to be sold publicly in Paris. Six months after this, its official introduction, not more than a dozen horses were slaughtered each week. Two years later about eighty were killed every week, and about fourteen butcher shops were engaged exclusively in its sale in the capital. From investigations made by Paris authorities, the horse yields a percentage of meat to his live weight of 65 to 70, which is more than that obtained from the ox. The price of the meat varies according to the pieces—tenderloin, at the time alluded to, was one franc per pound; and pieces of the neck and breast, five sous per pound.

In 1868 there were in Paris four restaurants of horse meat, and five establishments where sausage was made from horse flesh, and sold at half the price of other sausage.

The provinces were even then beginning to follow the example of Paris in slaughtering and selling horse meat. There was much less prejudice against its consumption than when it first commenced.

The horses slaughtered were generally old and worn out, but free from internal disease. When reasonably fat the meat was sold in pieces like beef; when not fat it was used for sausages. When very thin the meat was not offered for sale in any form. The authorities exercised vigilant supervision over the meat as regards quality and wholesomeness.

**THE ARTICHOKE.**—This vegetable is rarely seen on the American table, but is largely consumed in every part of France. It is boiled and eaten by dipping into a sauce each piece as it is consumed. Sometimes the sauce is prepared in the kitchen, but more generally each one makes his own sauce at the table, consisting of olive oil mixed with a trifle of vinegar and salt. Only the whitish part of the artichoke is eaten. It is nutritious, of a delicate flavor, and is more easily preserved from disease than the potato, in consequence of which one of the members of the Central Imperial Society of Paris recommends its substitution for that popular vegetable, at least to a certain extent. The same authority states that it is nourishing as well as economical food for animals.

**HOW TO EXTRACT COFFEE.**—If coffee, after roasting, were made as fine as flour by pounding in a mortar, it could be extracted so much better as to require no more than two-fifths as much as if it were only coarsely ground. An equally strong extract can be made by allowing water to stand on the grounds, as by giving it a boil or by filtering through it. The latter method is the true one for retaining all of the aroma. When coffee beans are roasted, an empyreumatic oil is produced, which being very volatile, is expelled if the coffee extract be boiled. It is better to make the grounds as fine as flour, and to extract by filtration, and never to boil.

**HOW TO MAKE TEA.**—Tea cannot be properly made from water that has been boiling long. Cold water must be put in the kettle, adding the tea at the moment of ebullition, and not a minute after. It might also be pointed out that the practice of measuring tea in spoons is a mistaken one, as the strength of the infusion depends on the weight; and a few larger or smaller leaves make a wonderful difference in the quantity contained in a teaspoon, and consequently in the strength of the infusion.

**TO DRY VENISON.**—There is no greater delicacy than dried venison. Wm. A. Jepson gives the *Ventura Signal* this recipe which he says is quick and effectual: Bone a nice fresh ham; cut through to the upper joint and put in the hole a piece of salt-petre the size of a pea; then immerse the ham in strong, boiling brine two or three minutes and hang up in a cool, dry, shady place, or, if preferred, smoke it.

**TAKE YOUR MEALS AT REGULAR HOURS.** Breakfast should be enjoyed soon after rising, and before any laborious exercise. Eat no late suppers. Severe physical and mental labor during the last hour, either before or after meals, should be avoided when possible.

**TO CLEAN BRASS.**—If stained, rub over with oxalic acid or strong vinegar; polish with rotten-stone pulverized and whieky or sweet oil, or turpentine; then rub with soft leather or buckskin.

### Domestic Receipts.

**TO PICKLE PEACHES.**—Take any quantity of good ripe peaches, wipe them clean, lay them one day in good brine, take them out and pour sufficient cold vinegar over them; let them stand one day and they are fit for use.

**A NICE WAY TO COOK IRISH POTATOES.**—Boil them until done, then remove the skin carefully, and mash and strain them through a sieve. Add some milk, butter, black pepper, and salt to the taste; bake half an hour and serve hot. A nice custard may be made in the same way, by leaving out the pepper and salt, and adding two eggs, sugar and nutmeg to suit the taste; bake half an hour; serve hot, with cream sauce.

**SCOTCH SNUFF** put in holes where crickets come out will destroy them.

**VEAL CROQUETTES.**—Take very fine minced veal, moisten it with cream, and a beaten egg. Season with pepper, salt, sweet-marjoram, and a little pounded mace. Form into small cones, either by hand, or in a wine-glass; crumb the outside, and fry, or else set into the oven and bake, basting frequently.

**TOMATO OMELET.**—Beat up six eggs, mix two tablespoonsful of flour, with a little butter, and add some salt and pepper. Peel four tomatoes, and chop very fine. Stir all together and fry. Oyster omelet is made in the same way, substituting a dozen chopped oysters for the tomatoes.

**HAM OMELET.**—To 3 eggs and 3 tablespoons of milk, take 1 tablespoon of cooked ham chopped or finely cut. Beat the eggs very light, add the milk and ham with a little salt and pepper. Then pour into a well-buttered frying-pan, enough to cover the bottom, and as soon as it cooks a little, begin to roll it up with a knife, till it looks like a lovely gold fish let out of a brooklet, and tastes even better than it looks.

**COCONUT CANDY.**—Use equal quantities of loaf sugar and grated coconut; add enough milk of the coconut to moisten the sugar. Put it to boil, and stir almost constantly. When the candy begins to turn to sugar, stir in the coconut as quickly as possible. Pour it into buttered dishes. Cut while warm with a buttered knife. Parched ground peas (heat) may also be used.

### Mechanical Hints.

**CONSUMPTION OF SILVER IN NEW YORK.** The sales of silver in New York, for consumption by manufacturers of silverware, including bars of refined and Mexican dollars, are said to aggregate \$5,000,000 annually. Including consumption of precious metals by manufacturing jewellers of all sorts, this aggregate is increased several fold, the estimate of New York being alone \$15,000,000—that is to say, \$5,000,000 in silver and \$10,000,000 in gold; and this is exclusive of what is known as "rolled stock" or ribbons. The fact is asserted that there is more silver used for domestic purposes in the United States than any other country in the world.

**COPAL.**—This resin, when in large pieces, commands high prices, even in those parts of Africa where found. The recent and fossil copal may be easily distinguished by the mottled surface, which is always one of its characteristics. Like amber, the fossil gum often incloses flowers and insects in a perfect state of preservation. Captain Grant has explained the cause of its production; the true copal gum-tree is a climber, running to great heights among the forest trees. It sometimes becomes entirely separated from its original root, and the copal exudes from these detached roots.

**CAMPOR A GOOD BAROMETER.**—The camphor bottle makes an excellent barometer. The thin flakes of the gum will arise to the top of the bottle when there is to be a change in the weather, from fair to cloudy and wet. When the flakes settle down to the bottom, it is almost certain to be good weather.

**FURNITURE POLISH.**—One pint of linseed oil, one wineglass of alcohol. Mix well together. Apply to the furniture with a linen rag. Rub dry with a soft cotton cloth, and polish with a silk cloth. Furniture is improved by washing it occasionally with soap-suds. Wipe dry, and rub over with very little linseed oil upon a clean sponge or flannel. Wipe polished furniture with silk. Separate dusting-cloths and brushes should be kept for highly polished furniture. When sweeping carpets and dusting walls always cover the furniture until the particles of dust floating in the air settle; then remove the covers, and wipe with a silk or soft cotton cloth.

## LIFE THOUGHTS.

SUPERABUNDANCE is a trouble; competency brings light.

HARMONY exists in difference no less than in likeness, if only the same key-note govern both parts.

NOTHING is more easy than to do mischief; nothing is more difficult than to suffer without complaining.

DESPISE a man, and you become of the kind you would make him; love him, and you lift him into yours.

LIFE's firmest ground is insecure, its strongest fortress powerless against the touch of the great destroyer.

### How to Get On in Life.

A young man writes to us that he has had "ten years' office experience," we suppose as a clerk or book-keeper, during which time he has saved "the sum total of \$75," which is his all. He wishes to settle in some "growing young town and grow up with it."—He is evidently sincere, and his letter shows that he is not deficient in ability and has some good sense. We therefore say to him, plainly, that success in life does not come in that way. No man finds a fortune by chance, nor can he "grow" into a state of prosperity merely by planting himself in a fresh virgin soil. Everything in life worth having is wrestled for and acquired through severe labor and self denial. It is a great mistake to suppose that the failures of aspirants in this line come from adverse surroundings. Circumstances have much less to do with material prosperity than is generally supposed. Favoring conditions may accelerate the acquisition of an estate, but the same application and self-denial will guarantee the final result under any conditions. There are exceptions, of course; but this is the rule. A man without a family who has been toiling in New York for ten years, and has laid up but \$75 dollars, would not "grow up" into anything better, even amid the stimulus of that wonderful activity which marks the youth of a thriving town. The accretion that comes upon a man who waits to grow up by outward helps, is only the overlaying of rust and canker that gnaw out the vitals. The true growth is that which comes from within, and employs every faculty in the earnest effort. Nearly all of our young men make the same mistake which our correspondent confesses—they spend too large a proportion of their earnings for adornments and unhealthy indulgences of the baser appetites. Fine clothes, jewelry, cigars, liquors, pleasure hunting, and other costly or vicious habits, waste no inconsiderable portion of their annual income. We heard a man spoken of the other day as one who had been remarkably "lucky" in establishing himself in a comfortable home, and that was the only word used to distinguish between him and an associate who had more brilliant talents, but failed of success. There was no luck in the matter, for we knew them both. They were both married, without children, and each entering upon a salary of \$1,000 per annum, went about the same time to look for board in Brooklyn. The "unfortunate" man took board for himself and wife at \$20 per week, which he said was the cheapest at which he could get a comfortable room in a first-class house. The "lucky" man looked for some time until he found clean, healthy quarters in a third story room at \$7 a week for the pair, his wife to do her own sweeping and make her own bed. He lived within his income and laid up money from the start; the other ran in debt and became embarrassed from the same hour. There is no secret in such histories; he who runs may read them. If any one assumes that the nobler part is to "enjoy life" as we go; and that the acquisition of an estate, the foundation of which is laid in early self-denial, and the structure built in patient toil with the same prevalent spirit ever present, is an ignoble ambition, we shall not argue the case. But we do say that those who desire this result can pursue it safely and surely in no other way, and if a man after knowing what it will cost, will not pay the price for it, he should not grumble at the fates, nor murmur against a discriminating Providence.—*N. Y. Journal of Commerce.*

**FOUR GOOD HABITS—punctuality, accuracy, steadiness and dispatch.** Without the first, time is wasted; without the second, mistakes the most hurtful to our own credit and interest, and that of others, may be committed; without the third, nothing can be done; and without the fourth, opportunities for advantage are lost which it is impossible to recall.

## STEPHENS &amp; CO.,

MANUFACTURERS OF

**U. S. STANDARD BOXWOOD AND**  
**IVORY RULES.**

ALSO EXCLUSIVE MANUFACTURERS OF

**L. C. Stephens' Patent Combination Rule.**This cut represents the COMBINATION RULE, which  
comprises a Foot Rule, Spirit Level, Try Square, Bevel,  
Plumb, Slope Level, Etc.It is made of the very best quality of Turkey Boxwood,  
heavily bound with brass, and is graduated with mathe-  
matical accuracy.The Square is adjustable, and can be tested and made  
perfectly true by the aid of a small screw-driver, but  
this is seldom required.In its application as a Slope Level it is especially  
adapted for Miners' use, as it shows the PITCH TO THE  
FOOT, and DEGREE OF INCLINATION at once. It is six  
inches long when folded, by one and three-eighths wide,  
and three-eighths inches thick, the cut being just one-  
fourth size.By the use of one of these, a huddler, mason, car-  
penter, or other workman, can always have in his pocket  
the most valuable of his apparatus used in construction,  
combined in a portable, useful and cheap form.—Scienti-  
fic American.

## PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING OCT. 17.

MINING-SLUDGE AND RIFFLE.—Converse J. Garland, Gwin Mine, Cal.  
SAW.—De Witt Riker, San Francisco, Cal., assignor to himself and Frederick W. Runge.  
SASH-TIGHTENER.—William E. Swett, San Francisco, Cal.  
SAD-IRON HANDLE.—Alexander Tait, Sonora, Cal.  
CONCENTRATING SILVER ORES.—Thomas Wren, Hamilton, Nev.  
HARNES.—George W. Dutton, Tomales, Cal., assignor to himself and John Ashton, same place.  
STEAM-PLow.—Oliver Hyde, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

### Important Industrial Enterprise.

The Vallejo *Chronicle* makes extended reference to an important industrial enterprise which has just taken shape in Vallejo, as an incorporation, with a capital of \$4,000,000, with an indefinite amount of funds behind that, to be called for when profitable investment for the same can be found. The Trustees are John B. Frisbie, Leland Stanford, M. S. Latham, F. D. Atherton, of California, and A. DeLaski and E. H. Green, of London.

The object of this incorporation is to improve the facilities presented by Vallejo as a railroad terminus and shipping point. Manufactories of various kinds will be established, distilleries, etc., put in operation, and every encouragement will be extended toward the development of the neighboring country. Immigration of skilled mechanics and operatives will also be encouraged, and all reasonable assistance will be extended to such industrial enterprises as can be profitably carried on there. Encouragement will also be given to the extension of railroad lines in various directions from that point.

Active steps will be taken in the spring to carry out the objects of the association. It is the intention, by establishing a free port, and otherwise favoring shipping interests, to make Vallejo the exclusive shipping point for all wheat and other products which can be raised for export along the various railroad and river routes which diverge from that port. It is understood that a connecting link will be built between the Petaluma and Vallejo roads in season for the movement of the next harvest crop. If there is no mistake in the general scope and purposes of this corporation, it will soon become one of the most important industrial enterprises ever set on foot on the Pacific Slope.

FIRES.—We hear of numerous fires all over this and adjoining States and Territories—most of them in the woods and fields, where they have been very destructive, but may in towns and isolated localities, where much damage has been done. On Friday last a destructive fire broke out in the town of Elko, on the C. P. Railroad, which resulted in the destruction of 30 buildings, with some \$60,000 worth of property. It is to be hoped that the rains will soon come, if for no other purpose than to moisten the present dried combustible matter now lying anywhere around, and endangering life and property all over the Pacific slope.

TESTED BY TIME.—FOR THROAT DISEASES, COLDS, AND Coughs, "Brown's Bronchial Troches" have proved their efficacy by a test of many years. The good effects resulting from the use of the Troches have brought out many worthless imitations. Obtain only "Brown's Bronchial Troches."

## The Scientific Press,

Established in 1860, is now the Largest, Most Original, Best Illustrated and most Ahly and Carefully Edited Practical Mining Journal on the Western Continent. Its contents are made up of fresh intelligence in a condensed and interesting style, easily appropriated by the reader, who finds its columns replete with new facts and ideas not obtainable in the books of the past or in any one other of the journals of the day.

Varied in its carefully compiled and conveniently arranged departments, representing the special and leading industries of the Pacific States—Mining, Mechanism, Manufacturing, Building, Improvements and Inventions—it becomes a weekly informant to all Scientific, Mechanical, Manufacturing and Industrial Progressionists on the coast, an immense list of whom testify to its pleasant, profitable and elevating influence.

The progress of our journal has been steady and unvarying. Encouraged by a liberal class of readers who exhibit their appreciation in a substantial way, we shall, with our increasing facilities, experience and information, make each coming issue superior to its predecessor.

Let every friend of Science and Industry on this side of the continent take pride, not only in sustaining, but accelerating the advancement of a faithful representative of its highest interests by subscribing for it and urging its patronage by others—now, without delay.

Subscription \$4 per annum, in advance.

### Our Printed Mail List.

Subscribers will notice that the figures found on the right of the pasted slips, represent the date to which they have paid. For instance, 21st970 shows that our patron has paid his subscription up to the 21st of September, 1870; 4172, that he has paid to the 4th of January, 1872; 4173, to the 4th of July, 1873. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction. Please notify us if you are not properly credited within two weeks after paying.

### Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

W. H. MURRAY—General Traveling Agent.  
O. H. DREWRY—Special Corresponding Agent.  
TALBOT P. POWERS—Solana and neighboring Counties.  
I. N. HOAG—Sacramento, General Agent.  
F. M. SHAW—San Diego.  
L. P. MCCARTY—California.  
M. W. LEVY—Denver, Colorado.  
M. B. STARR—Pacific Coast.  
THOS. POTZER—California.  
Wm. J. CLARK—California.  
JOSEPH DIMMICK—California.  
E. P. HICKS—California and Oregon.  
A. O. KNOX, City Soliciting and Collecting Agent.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

SUCCESS IN BUSINESS.—Success in the business world usually depends upon being thoroughly prepared for its duties. Young men! if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24 Post street, San Francisco. This is the only school on the Pacific Coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book-keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which cannot be discussed here. Call at the College and examine its workings. If unable, send for circular, and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address E. P. HEALD, President, Business College, San Francisco, Cal. 10v23bp-3m

Go to the Best.—Young and middle-aged men should remember that the PACIFIC BUSINESS COLLEGE is the oldest and most popular and successful Business Training School on this coast. Upwards of Three Thousand Students have attended during the past six years, many of whom now hold prominent positions in the first banking and mercantile houses of this city. This is the MODEL TRAINING SCHOOL FOR BUSINESS on this coast, having the greatest corps of Professors and Teachers, and the greatest number of students in attendance, of any institution of the kind. Young men flock to this College from all parts of the Pacific States and Territories, British Columbia, Mexico, Sandwich Islands and South America. We shall be pleased to send our College Circular, giving full information to all who send us their address. When you write, mention that you saw this notice in the PACIFIC RURAL PRESS. M. K. LAUDEN, President, San Francisco, Cal.

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss the chance. Sample Free. Address Hudson River Wire Works, 75 William Street, N. Y., or 1 Dearborn street, Chicago, Ill. 23v1-12mtp

Opera Glasses, Pebble Spectacles, and Eyeglasses, in great variety, wholesale and retail. C. MILLER, Optician, 205 Montgomery street, Russ Block, San Francisco. 7v23-3m

## Scientific and Practical BOOKS

—ON—  
MINING, METALLURGY, ETC.

BY GUIDO KUSTEL

MINING ENGINEER AND METALLURGIST.

Published and Sold by  
DEWEY & CO.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick-silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his speciality. Price \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniures, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 100 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of this general metallurgy of silver ores. 1854.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, \$5 in cloth; \$6 in leather—coin.

For single copies of the above works, or for this trade, address

DEWEY & CO.,

Publishers and Patent Agents, Scientific Press Office, San Francisco.

Under a Burning Sun, where Bilious affections and Fevers of various descriptions so generally prevail,

Tarrant's Effervescent Seltzer Aperient

Has been successful beyond all parallel. Hence the physicians of the tropics give it their emphatic sanction, prescribing it in preference to every other aperient in use. The patients, of course, gladly acquiesce, for this preparation is one of the most delightful, as well as mild and cooling cathartics, chemistry has yet devised, and possesses every medical virtue of the far-famed German Seltzer Spa. It is a powder that only requires the addition of water to produce an instantly delicious effervescent beverage, as well as an invaluable medicine. Ask for and accept none but the genuine.

SOLD BY ALL DRUGGISTS.

SANBORN & BYRNES,

South Point Mills, Berry Street,

Between Third and Fourth, San Francisco. Orders from the country promptly attended to. All kinds of Stair Billiard Balls and Ten Pins. Fancy Newels and Balusters. 21v22-6m.

A Novelty Printing Press for Sale.

It is a new foot-power Press, and just the thing for a small country job office or for amateur printers, and druggists and others who wish to do their own printing. At manufacturers' price, with freight added. Enquire at this office. 11v24tr-1ams

## THE IMPROVED AMERICAN VAPOR STOVE.

No Wood, Coal, Smoke, Ashes, Stovepipes nor Chimneys, and Perfectly Safe, Economy and Convenience combined.

WILLIAM FRIEL, Manufacturer,

No. 69 and 71 Fourth street, S. F.

All kinds of Lamps altered to burn Patent Oil with or without chimneys. Gasolins and Patent Oils for Stoves and Lamps for sale. County Rights for sale. 10v23-3m

MENZO SPRING,

Manufacturer of Dr. Douglas Bly's

Patent Artificial Limbs,

S. W. corner Second and Jessie Streets, San Francisco

All other kinds changed and repaired. The late improvements on the Dr. Bly Limbs, especially his two best Legs (one with, the other without lateral motion at the ankle joint), make them far superior to all other Artificial Legs in use. (See illustration of Anatomical Leg, No. 8, present volume).

For particulars call or send for circular. Circulars sent free. Address MENZO SPRING, 11v23-sa 101 Jessie street, San Francisco, Cal.

Longshore's Combination Tool.

This device is just what its name indicates. As a KRONEN Tool, it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pincers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

WIESTER & CO.,

17 New Montgomery street (Grand Hotel), SAN FRANCISCO.

Phelps' Patent Animal Trap,

FOR GOPHERS, SQUIRRELS, RATS, CATYOTES, and other "Varmints."

This Trap, as may be seen, is of simple construction and not likely to get out of order, and very durable.

It is Very Efficient

and can be used conveniently by women or children. THE CHEAPEST AND BEST YET INVENTED. Price 50 cents. By mail, prepaid (to places where express charges are high), \$1. A liberal discount to clubs or dealers who buy by the dozen. Address the inventor and manufacturer, D. N. PHELPS, 31-1y-awbp San Leandro, Alameda County, Cal.

CAST IRON PIPE,

FOR WATER AND GAS.

PIPE of all sizes, of a very superior quality, is now being made at the

Pacific Iron Works,

In this city, under the Patents of Farrar & Whiting. 17v23-3m

GODDARD & CO.

BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, that BETTS'S NAME IS ON EVERY CAPSULE he makes for the principal merchants in England and France, the enabling vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsules are not used merely for the purpose of the ornament, but that they are serviceable in protecting the wine from injury, and insuring its genuineness. MANUFACTURED BY J. WHARF ROAD, CITY ROAD, LONDON, and BORDEAUX, FRANCE.

Mining and Other Companies.

On account of the time necessary to mail the present large edition of the Scientific Press we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

**Altona Gravel Mining Company—Location**  
of works, Grass Valley, California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 21st day of October, 1871, an assessment of 25 cents per share was levied upon the capital stock of said company, payable immediately in United States gold and silver coin, to the Secretary, No. 24 Merchants' Exchange, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on Monday, the 27th day of November, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 13th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.  
DAVID WILDER, Secretary.  
Office, No. 24 Merchants' Exchange, California street at San Francisco, Cal. oc24-3w

**Highland Silver Mining Company—Location**

WIESTER & CO.

PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.,  
ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON  
SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:  
Being built of wood entirely, they are not affected by change of temperature.  
The timber used is placed so directly in the line of strain, that less material is required to support the same load.  
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.  
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.  
Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.  
F. MALOON, Secretary. W. H. GORRILL, President.

WALTHAM WATCHES.

In soliciting anew the public patronage of WATCHES of domestic production, the AMERICAN WATCH COMPANY respectfully represent:  
That no fact in the history of manufactures is more completely demonstrated, than that the best system of making Watches is the one first established by them at Waltham. That system always had the warrant of reason and common sense, and now the test of time in the trial of the Watches themselves cannot be denied to have been ample and satisfactory. It is admitted on every hand—the evidence of daily observation and common reputation—that the Watches not only keep correct time, but that as machines they ENDURE. It should seem that nothing more is needed, but that their sizes, shapes and appearance should suit the tastes of the people. As to all these conditions the American Watch Co. are now fully prepared to answer the exactions of the market. They confidently assert there is no longer any need for such reasons to import watches of any description whatever. Every size in ordinary demand, every shape and every variety of finish and decoration, may now be had. And as to price, the recent reductions leave no room for doubt that the Waltham system of Watch-making is

The Most Economical as well as the Most Reliable,

And that the Waltham Watch is the Cheapest as well as the Best.

Many new varieties of movements have been added during the last year, all of which display the Latest Improvements in design and finish, and evince the rapid progress the Company is making toward perfection in the art. Among these the new small size Watch, for Boys and young gentlemen, is to be specially noted. A very low price has been made for this Watch because it is a boy's watch, and with the object of bringing it within the means of boys of all classes. Price being considered.

No such Watch, in Quality and Beauty,

Has ever, in any country, been produced.

The "CRESCENT-STREET" FULL PLATE WATCH, added during the last year, is now made either with or without stem-winding and setting attachment. This Watch, in either form,

The Company Challenges all Manufacturers of all Countries

To beat or equal for its price. It is made with all the latest improvements in every part—improvements which improve—and which not only make it better for its purposes as a timekeeper, but will make it the great favorite with Watchmakers. This, the highest grade of full plate Watches made in this country, in size and appearance, in finish, and general excellence, is especially intended for and recommended to business men, and in particular to Railway and Expressmen, to constant travelers—in fact, to all live men who must be told by their Watches the correct time of day whenever they want it. All such men should have the

"American Watch Co., Crescent Street."

Counting on such destination for this variety of their manufacture, the company devotes the greatest care to its construction, employ upon it only their best men and best machinery, and issue it with their reputation at stake upon its success.

For sale by all leading jewelers. No Watches retailed by the Company. For all other facts address

ROBBINS & APPLETON,

General Agents for American Watch Company, No. 1 Bond street, New York.

**Silver Sprout Mining Company—Location**  
of works and mines, Kearsarge District, Inyo County, State of California.  
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of September, 1871, an assessment of twenty-five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 318 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 13th day of November, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 4th day of December, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. WIESTER & CO., 17 New Montgomery st., S. F.

CRAIG & BREVOORT'S  
Patent Condenser for Steam  
PUMPS, &c.

NO. 1.

The annexed engravings represent a Condenser intended to be attached to the ordinary steam pump, thereby bringing it within the class of low pressure, or more properly speaking, of condensing engine; the steam, when it has done its work in the cylinder, instead of being exhausted into the atmosphere, is conducted to the condenser, on its entry into which, it meets the water drawn by the pump, and is immediately condensed.

The Cut No. 1 represents a vertical section of the Condenser, and No. 2 an elevation.

The flange D is bolted to the suction orifice of the pump, and the flange S to the pipe leading to the well, or whatever source of supply the pump may have; W is a water jacket surrounding the main chamber of the condenser, B, and with which the suction pipe, S, communicates, permitting a free circulation of water within the jacket and into the hollow cover or top through the series of openings, one of which is shown at A, and from thence into the body of Condenser, B, through pipe P, carried by float F; the pipe P also acts automatically as a valve to enlarge or contract the space through which the water enters it, by which means the possibility of the condenser being at any time flooded is avoided. The pipe P, it will be observed, also acts as a guide to float F.

The Valve, C, (shown in Cut No. 1), which is raised or lowered by means of screwed stem—shown coming through elbow in Cut No. 2—is for the purpose of increasing or decreasing the flow of water according to the capacity of the pump to which it is attached.

NO. 2.

The exhaust pipe from steam cylinder is screwed into cover at E; the exhaust steam is thus thrown directly into contact with the water entering the condenser on its way to water cylinder of pump through D. A vacuum being of course immediately formed, acts on the exhaust side of the steam piston, aiding it in its work. If at any time it is desirable to run the pump without the condenser, it is only necessary to turn the three-way cock, which is placed in the exhaust pipe, into such a position as to cause the steam cylinder to exhaust into the atmosphere; when this is done the pump is perfectly free from the condenser, and acts as if it were not attached. This condenser is especially useful for pumps running in mines, or any other position where trouble is experienced in getting rid of the exhaust steam. Address  
H. L. BREVOORT,  
6v23eovly 128 Broadway, New York City.

**Machinery.****WHY THE WILSON****Patent Steam Stamp Mill**

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Oam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation. For further particulars address

FURMAN R. WILSON,  
San Francisco.**GARRATT'S CONDENSING LUBRICATOR,**

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission &amp; Fremont streets, San Francisco.

DESCRIPTION:—D, is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber D. E, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. F, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the election of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. feb-tf

HUGHES' PATENT  
REMOVABLE GLOBE LANTERN.

Since the time when King Alfred made the first lantern by surrounding a candle with a transparent casing of horn, this class of appliances has been one of the greatest utility and most extended use. Among the latest improvements in its construction is that illustrated in the accompanying engravings, and designed to secure the three-fold object of providing for the easy cleansing of the glass portion, the secure retention of the upper in place upon the lower part of the lantern, and the affixing of the ball to the top of the lantern in a durable and efficient manner. The base of the lantern is provided with the usual detachable lamp, and at one side has hinged to its upper edge a wire frame designed to carry and protect the glass portion of the lantern, and at the upper end of which is the cylindrical top, perforated in the ordinary manner to permit the escape of the products of combustion from the lamp. Arranged at that side of the base opposite the hinge is an angular spring-catch so applied as to catch over the annular lower rim of the wire frame, and in conjunction with the hinge, to hold the said frame firmly in place upon the base as required when the lantern is in use.

This Lantern is offered as

The Best and Most Desirable in Use,

all things considered. Its price is reasonable, and when once tried no other will be accepted.

Individuals, Dealers, Railroad Companies, and all persons and institutions about to purchase Lanterns, should inquire for this kind; and if not for sale in your locality, address the inventor for circular of full description, price list, etc.

Patented August 10 and December 28, 1869, by

Address 1811 Sidney street, East Birmingham, Pa.

## Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp, to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

## Automatic Steam Vacuum Pump.

Our illustration represents one of the Patent Automatic Steam Vacuum Pumps manufactured by the Aetna Iron works of this city applied to filling the tanks of locomotive tenders. The pump may be placed underground and by attaching a steam pipe to the locomotive and turning on steam it is immediately put in operation. The construction of this pump is simple and the expensive features of the complicated and heavy low-pressure pump-engine are wanting. It consists of a single hollow cylinder containing no piston or other mechanism. Attached to the top of this cylinder is a steam pipe and a small chamber, and to the bottom of said cylinder, valve chambers are affixed, containing plain "flap" valves, opening or closing ports, through which the water is received and discharged in the same manner as in a common pump. These valves by means of light, simple connections, serve to operate all the other moving parts of the apparatus, thus making the pump completely automatic. The receiving, discharging and steam pipes are connected to the cylinder in substantially the same manner as in ordinary pumps.

After setting the pump into position the cylinder is filled with steam and the same instantaneously condensed, thereby forming a vacuum in the cylinder; after this the operation is as follows:—Water is forced by the atmosphere through the lower receiving pipe, filling the cylinder from below, while at the same time a small quantity of air is admitted through a small opening above the water; immediately the vacuum is supplied, steam is admitted in a thin sheet on the top of the air, compressing the same, and forcing the air and water downward, the latter escaping through the discharge pipe.

There is no condensation of steam by this operation, air being one of the best non-conductors of heat known, and, as it is about twice as heavy as steam, the latter lies upon the top of the air, and this stratum of air acts in all respects like a piston to separate the steam from the water, and yet transmits the pressure, and does it, it will be observed, without friction, waste, or condensation.

As soon as the water is forced out of the cylinder, the steam supply is shut off. The steam (remaining in and filling the cylinder) is condensed, a vacuum again created, and the operation repeated; it only requiring a steam pressure of one pound to raise water a distance of thirty feet. The amount of water to be raised in this way depends only upon the size of the apparatus.

The cylinder and valves, and also the slight machinery connected therewith, are of the most durable construction, and the composition of the same is such as to adapt them for all services.

This pump embodies in a simple hollow cylinder, with but few pipes, simple valves and light valve rods, all the important features of the heavy complicated low-pressure engine. Its special merits are economy in fuel; quietness of operation; simplicity of construction, thereby rendering it easy to repair; no packing required, there being no piston; no loss of power in overcoming friction, there being

## Metallurgical Works at Vallejo.

The Vallejo Land and Improvement Co., to which we made a lengthy allusion last week, propose establishing at that point, early next year, extensive metallurgical works, which, according to the *Chronicle*, will exceed in extent any establishment of the kind on the American continent. This location is extremely favorable for receiving ores from the mines of Nevada and Utah by rail, while wood and coal can be obtained in reasonable distances and at minimum prices.

The copper mines of Mariposa and Cop-

## Recent Mining Discoveries.

### California.

A ledge of gold-bearing quartz was brought to light a short time since, on the South Fork side of the divide, between the South and East Fork of the North Yuba river about three miles from Downieville, Sierra Co. Arrangements are being made to work the mine in a systematic manner. It is called the "High Commission."

A new claim, 3,000 feet in length, on French Hill, Calaveras Co., was recorded last week under the name of "Cosmopolitan." The rock prospects well and active work will be commenced in a few days.

A marble quarry has been found about eight miles from Nevada City, near the Yuba river. It is said the ledge is 150 feet in width. The marble is of a dark color and a slab three feet by one foot wide has been sawed out and preserved as a sample of the quality.

A quartz ledge was discovered last week in Grass Valley Township, Nevada Co., on the road between Union Hill and the Idaho mine. It is called the "Jessie" mine.

### Oregon.

A lead of cinnabar ore 12 feet wide, was lately found by Wm. Holmes, on Horn Creek. It has created considerable excitement in the locality among prospectors and others.

### Nevada.

The discovery of a marble mine has been made four miles west of Westgate, Churchill Co., on the old overland stage road. The marble is of good quality and susceptible of a fine polish.

### Utah.

Still another tin discovery is reported near Ogden. The new mine is called the "Gen. Aspinwall." The deposit is said to be large in extent and rich in mineral.

An extensive coal bed has been discovered a few miles from Glenwood, Sevier Co. It is about three miles in length and from two to four feet thick. A company has been organized to develop it.

**AMENDED MAP.**—The amended map of township 12 north, range 8 east of Mt. Diablo meridian, has been filed at the U. S. Land Office, Sacramento and any preemption claim not filed within three months from 28th ult., will be deemed forfeited. This township includes the town of Auburn Placer county.

**THE ARCTIC EXPEDITION** under Capt. Hall, in the "Polaris," arrived at Upernavik on the 30th of August and sailed from there, going north, on the 5th of September. All on board are reported well and confident of success.

STEAM VACUUM PUMP FOR FILLING LOCOMOTIVE TENDERS.

no intermediate machinery between the power and effect; no damaging effect of sand, salt, or sediments.

For further particulars address Jno. O. Hanscom, Aetna Iron Works, San Francisco, Cal.

**COAL OIL IN RUSSIA.**—A coal oil deposit has been discovered at a point about 150 miles southeast of Moscow, Russia, and extensive machinery is being erected to refine the same. The wells do not appear to be flowing, as the oil is "raised."

**PAPER CAR WHEELS** are proving far more durable than those made of iron. A set on a Jersey road has run 160,000 miles, worn out one set of steel tires, and is still in good condition with a new set. The ordinary iron wheels only run about 75,000 miles.

peropolis, it is also reported, are to be opened again, and it is highly probable that the ores can be profitably smelted in California. The managers of this enterprise contemplate putting up crushing mills, roasting, smelting and refining furnaces for gold and silver ores. The very latest and most economical processes will be employed, with all of the most approved devices for separating the metals from their bases and turning them out as a refined article.

The capacity of these works will be greater than the Selby metallurgical works in this city, which cost \$450,000, and where 1,000 men are employed directly and indirectly. Not less than \$500,000 will be expended in getting them into shape, after which they will be extended with the increase of business. The industrial classes, and the money interest generally, will be largely benefitted by the establishment of works of this character, which will be a nucleus around which other manufactories will inevitably spring up, and thereby open up new markets for farm produce.

## MECHANICAL PROGRESS.

## A New Combination Loom.

The New York Times of a recent date contained the following paragraph, relative to a late invention to which we have already made brief reference. If this loom is anything like what is claimed, it can but excite a deep interest among manufacturers everywhere:—"Abel's new combination loom, now on exhibition, is one of the most wonderful and beautiful of recent inventions. It occupies but one-tenth the space of, and accomplishes ten times more work than, any other loom. A boy can furnish enough power for several machines. The old needle is used, but the bobbins are so free from tension that delicate threads can be knit and woven into a fine strong cloth. The entire operation is viewed at a glance. The yarn passes direct from the bobbin. Knots are smoothly sheared and fresh bobbins are supplied without any interruption. There is no dressing, beaming, spooling, or warping; in fact the old method is entirely revolutionized. The machine makes twenty-five yards of cloth per hour. It takes its own warp of filling from the same bobbin as the weft threads. It weaves a cloth that cannot be unravelled, of jute, flax, wool, cotton and silk, and can produce fine blankets, strong carpets, wool-sacks, gunny-cloth, bagging, cotton, linen or silk textures—indeed, anything can be woven or knit. The operation is more noiseless and beautiful than that of the sewing machine. The introduction of this invention into general use has already commenced, and it bids fair to greatly reduce the price of good and durable home-made cloth. Many persons possessing small water and steam powers heretofore unavailable will now be enabled to successfully compete with the larger manufacturers, who by the old process, required much more power and room. No printed description can do full justice to this invention, which must be seen to be appreciated."

## The Screw Rudder.

A new invention has just been patented in Naples by Mr. Salvatore D. Marin. The screw steamers can direct their course with this new invention by the power of the screw alone, and dispense entirely with the rudder, so that instead of losing part of the power on account of the resistance given by the rudder, the screw-rudder increases the power; besides, the rudder can only act when the vessel is in motion, whilst the screw-rudder will make the vessel turn on itself when standing still. The rudder frequently becomes useless against sea and wind, but it appears that the screw-rudder serves and follows the will of the captain, because it gives effective motions, and not motions which are the result of power and resistance. The vessel going backwards obtains by this rudder of the screw advantages entirely new in navigation, and can be directed at will; and when going forward the system presents also some new advantages, besides giving great improvements on the motion obtained by ordinary rudders, being much more powerful; and the turnings much shorter and more rapid. The screw-rudder can easily be applied to every screw steamer, either mixed or armour vessel, very little changes being required; and for men-of-war, the dispensing of the rudder will place the motion of the vessel more under protection from hostile projectiles. It is also a great advantage in case of the vessel being thrown ashore. The Italian Government is about to try the necessary experiments for its application.—*Mechanic's Magazine*.

**COATING COPPER AND BRASS WITH ZINC BY A WET PROCESS.**—Cover, with a concentrated solution of sal-ammoniac, zinc in grains or powder, placed in a non-metallic vessel; warm to ebullition and introduce into the mixture the objects of copper or of brass which it is desired to coat, after having properly cleansed them. After a few minutes, the objects will be covered with a brilliant, firmly adhering, deposit of zinc. The granulated zinc is obtained by pouring the molten metal into a warm mortar and triturating vigorously, with an iron pestle, until it solidifies.—*M. R. Boettger*.

**ALUMINUM BRONZE** has been used, and, it is said, with great success, as an anti-friction alloy for journal bearings. The journals used were of hard steel, and care having been taken to exclude anything like grit, the wear was found to be very slight.

## Engraving by Electricity.

The efforts which have been made from time to time, with but poor encouragement, to engrave on metals by means of electricity, seem at last, says the *Iron Age*, to have resulted in the attainment of practical results. An ingenious French mechanic has produced an invention by which a metal plate, upon which a design is drawn with a chemical ink of some kind is slowly rotated with its face vertical, and several other similar plates, graded in size, are also slowly rotated by appropriate mechanism. The object of the invention is to engrave on the smaller plates the design traced upon the largest, on different scales of magnitude, which is accomplished by applying a cutting point to the face of each plate, and which is pressed against it by means of an electric current whenever a blunt point, applied to the large plate, encounters the ink in which the design is traced—the cutting points being at other times withdrawn. The point presented to the first plate is merely a "feeler," which determines by electrical agency whether the ink is beneath it or not. If it is, the points are pressed into the surface of the other plates; if not, they are withdrawn and prevented from cutting. The feeler and the briars must, of course, all follow a spiral track. This is crude, and can be made applicable to the reproduction of certain kinds of designs only, but it is considered a long step in the direction of practical success.

**A NOVEL RAILROAD.**—A novel tramway or railroad has been lately built in Turkey, by an English engineer, the propelling power of which is not steam, but animal, horses or mules being employed. A single-rail is laid on sleepers, and the carriage has wheels in the center on the same longitudinal line. Through the car runs a balancing pole, the two ends of which, projecting three feet or more, are secured to saddles on the backs of mules. The animals will thus be one at each side of the load instead of in front, as ordinarily. It would be impossible for the car to turn over, because in order to do so, it would have to force one mule to the ground and lift the other in the air; and, moreover, as the floor would only be six inches above the rail, an overturn would be of no account. All the weight of the car, if evenly distributed, would bear upon the rail, and the animals, having no load on their backs, would be able to exert considerable traction power. The inventor suggests its employment not only for military purposes, but also for tramways in large cities; and says that, where space is very valuable, a horse or mule on only one side of the car would be sufficient. In towns, on bridges, and other important places, the rail might, for a short distance, be dispensed with; and the passenger vehicles should be fitted with a small friction wheel on either side, so that if a horse should fall down, the balance of the carriage would remain undisturbed.—*National Car Builder*.

**TRANSMITTING POWER BY LEATHER BELTS.** The experiments made in the United States with a view to discover the best way of transmitting power by means of leather belts, have led to the conclusion, that the most effectual way to prevent the slipping of the belts is to cover the pulleys with leather. From this, it would appear that leather on leather offers a certain steadiness, and with the further advantage that the belt does fly off, and wears out less rapidly than when it runs on iron or wood. It is found in practice in a spinning factory, that a belt running on leather will produce a thread free from knots, and of much greater length, within a given time, than when running (and slipping) on an iron pulley. And we learn that in a steam mill, with five run of millstones, each set ground 27 busbels a day after they were covered with leather, being from three to four busbels more each than before. In paper mills and sugar mills, equally satisfactory results have been obtained; and we may conclude that pulleys covered with leather are best under all circumstances, even where ropes of wire are used.

**STEEL.**—Mr. Parkes, the inventor of the beautiful preparation of solidified oil, known by the name of "parsine," has recently discovered a process of purifying iron for the fabrication of steel. He first removes every particle of sulphur and phosphorus—the two elements that most deteriorate the quality—by ejecting into it fluoride and chlorides, while in a state of fusion. Afterwards he converts it into steel, by melting it in contact with coal, and again treating it with alkaline chlorides.

## SCIENTIFIC PROGRESS.

## Experiments in Chemical Dynamics.

J. H. Gladstone and Alfred Tribe have recently communicated a paper to the British Royal Society, in which it is shown that in various decompositions of metallic solutions the chemical change in a given time is not in proportion to the amount of salt present, but that twice the quantity gives three times the chemical action; and also that while silver is deposited on copper, in the decomposition of nitrate of silver by copper, an actual passage of the nitric element towards the copper plate occurs. In the present paper the authors exhibited the latter phenomenon in a dissected form, with other observations. A copper plate was immersed in nitrate of copper, and a silver plate in silver nitrate, while the two metals were connected by a wire, and the liquids by a porous cell; silver was deposited upon the silver plate and the copper plate was dissolved. The specific gravity of the copper nitrate solution increased from 1.015 to 1.047, and only a trace of this salt passed into the cell, which originally contained silver nitrate. The passage of  $\text{SO}_4\text{H}$  was also found to take place by an analogous experiment. Several experiments were made in which the nitrate of silver was kept constant, but the nitrate of copper was increased in equivalent multiples. It was found that the silver deposited increased with the increase in copper salt, being about double when the copper salt was seven times as strong, and that the effect of successive additions gradually diminished. This is in strict accordance with other experiments, showing that when the copper plate is immersed in a mixture of the nitrate of copper and silver the amount of silver deposited is increased, though in diminishing ratio by successive additions of copper salt. That this acceleration is not produced by copper salt only, was proven by repeating the experiments with various other nitrates. The tabulated results show that the increased effect does not depend simply upon the nitric element, but likewise on the nature of the salt.

**THE NEW EXPLOSIVE—PICRIO POWDER.**—Professor Abel, Chemist of the Department of War, at the Royal Arsenal of Woolwich, has succeeded, after a great many experiments, in perfecting the new explosive agent which he discovered recently and named *picric powder*.

This compound, the action of which is less violent than that of gun cotton, nitro-glycerine, or picrate of potash, is much more explosive than ordinary gunpowder, and possesses several other properties which appear to render it peculiarly adapted to its intended application. It possesses specially the merit of being promptly and easily prepared, of being less dangerous than other similar explosives, and above all, less liable to take fire by percussion. This powder is to be subjected to a thorough test at Woolwich.

**THE MOUNT WASHINGTON OBSERVATORY.** Sergeant Hearn, of the United States Army, is now on Mount Washington, where he will remain the coming winter with a single companion. The experience of last winter has suggested some important improvements in the establishment of the winter quarters there which have been made. The observations made from this hyperborean peak last winter are considered of sufficient importance in the advancement of science to be again repeated, with the hope of additional researches.

**A NEW METHOD OF OBSERVING THE SUN.** P. Secchi recommends the use of a direct vision spectroscope, behind an ordinary spectroscope. In this way, he says, a sharply defined image of the sun is obtained, on which the protuberances may be measured, and observations generally be readily made.

The fading of photographs is attributed by some to the difference of the mounting boards and the adhesive material employed.

**HEAT OF THE MOON.**—Lord Rosse has found that the heat of the moon is transmitted by a plate of glass in the proportion of 12 per cent., while the same plate allowed the passage of 87 per cent. of solar heat, and only 1.6 per cent. of the heat emitted by a body with the temperature of  $180^\circ$ . His observation, on the apparent temperature of the sky gave him values which vary between  $16^\circ$  and  $31^\circ$ . He finds that between narrow limits, the heating power of the lunar rays appeared to diminish with the altitude only one-third as much as the intensity of the solar chemical rays, as determined by Roscoe and Thorpe. The light of the moon was found to diminish with the altitude in the proportion of three to one, and the lunar heat of about five to one. So far as it was possible to judge by these observations the maximum of heat appeared to be given out a little after full moon.

**SUN ENGINE.**—Several inventors in different countries are attempting to utilize the heat of the sun's rays, and to construct a sun-engine. Many people shake their head at this idea and ridicule the very idea of success. But they are certainly unacquainted with the stupendous force at disposal. To convert one pound of water from zero to steam requires 637 centigrade units of heat. The researches of men of science have proved that every square centimeter of the earth's surface receives not less than 221,675 centigrade units of the sun's heat annually. Forty per cent. of this is absorbed by the surrounding atmosphere, and sixty per cent. reaches the earth. This gives seven centigrade units received per second on each centimeter, so that ninety-one square feet of the earth's surface would receive heat enough every second for the vaporization of one pound of water.—*College Courier*.

**CONTROLLING BALLOONS.**—While experimenting with a magnetic needle, and observing the well-known fact that when this needle is thrust through any solid body and delicately poised, the attraction of this needle is strong enough to turn the body toward the north, it occurred to me that this principle of the needle might be applied to aid in guiding balloons.

Aeronauts have vainly sought for some contrivance for guiding, or preventing the rotation of the balloon. Now, suppose we construct a powerful magnetic needle, or bar, long enough to pass through and project from each side of the balloon; as the slightest influence will rotate a balloon or any other body when suspended in still air, or in a steady current of air, the magnetic bar would keep one side of the balloon toward the north, and other appliances could be used to drive it in other directions.—*Scientific American*.

**ON THE BEHAVIOR OF SUPERSATURATED SOLUTIONS WHEN EXPOSED TO THE OPEN AIR.**—C. Tomlinson communicates a paper to the British Royal Society, in which he states that supersaturated solutions of Glauber's salt (and also of Epsom salt, and of alum) may be exposed to the open air for many hours, and even be taken out of the flasks in clean metal spoons, without crystallizing. If crystallization occurs, a nucleus may always be found in the form of an insect, a particle of soot, etc. If, during exposure, a rain comes on, this solution crystallizes in consequence of the nuclei brought down, but if the flask be put out during a heavy rain, after the solid nuclei have been brought down, no crystallization occurs.

**OZONE.**—M. Loew endeavors to prove, by a long series of experiments, that the oxidizing principle of turpentine is not ozone, but a new kind of *atomistic oxygen*, endowed with some physical force, probably caloric, and which is identical with *antiozone*. The author cites a curious result of the formation of drops of water on the sides of a tube, when pure essence of turpentine and dry oxygen were exposed to the sun in a sealed tube, for several weeks.

**ORGANIC MATTER IN QUARTZ CRYSTALS.**—Experiments made by heating smoky quartz crystals in a retort, to which all access of organic matter was most carefully prevented, gave a product containing carbonate of ammonia, which proved the presence of organic matter.

**UTILIZING A WASTE PRODUCT.**—Iron filings which have been used to convert nitro-benzol into aniline, have recently been applied with great success to the purification of illuminating gas.

CORRESPONDENCE.

EUREKA AND ADJACENT DISTRICTS, NEVADA.

EDS. PRESS:—I left White Pine on one of the coaches belonging to Woodruff & Ennor's stage line, so well and favorably known to the traveling community throughout Nevada, and arrived at

Eureka, in time for supper. This thriving district is one of the best base metal districts on the Pacific Coast. It was only "struck" a few years since, and now bids fair to be second to none in Nevada. The well-known "pancake rock" abounding in large deposits near Eureka, is the best possible thing for building furnaces. Some eight or ten furnaces are now running successfully, and a few quartz mills will soon be erected in the vicinity of those mines which yield milling ore. The place is in a prosperous condition, and none are out of employment. The *Eureka Sentinel*, a well edited journal, was a "weekly" when I was here last, but in order to keep pace with the other improvements of the town, and furnish its readers with early news, has since become a daily.

Water Works. The city is about to have a large water pipe laid from the springs up the cañon, which will be of great convenience to families, and a safe-guard in case of fire. Some 4,450 feet of pipe—made by Locke & Montague, of S. F., will be laid two feet underground. Major McCoy, an old resident of Eureka, is superintending the enterprise.

The Consolidated Company have a large force of men employed at the mine and furnaces. The men in the Bon-eye mine, belonging to this company, struck a new ore chamber a short time since, north of the north shaft, which is very rich. It is 8 feet wide, and is already uncovered for a distance of 32 feet. No estimate can be made as yet of its extent. The ore assays \$130 in gold, without the silver or lead. The main shaft is 160 feet deep, running through vein matter the entire distance, and cutting in its progress three distinct strata of rich lead, gold and silver-bearing ore. This Company make about 61 tons of bullion in three days, valued at \$400 per ton. In the

Richmond, located west of the Champion, after going down an incline 40 feet, we descended a shaft 25 feet to an old ore chamber. The ore is chloride, averaging, I am told, \$100 per ton. The chambers already worked show this deposit to be an extensive one. The bullion is very fine. The company own three claims, with a large furnace in the city which is running successfully. The furnace has turned out about 5 tons of bullion per day for the last 65 days. It is a "circular," lined with "pancake rock," the last lining of which lasted 69 days. They have a forty-horse power engine. J. B. McGee is foreman, and has been very successful as a smelter. G. M. Ogden is general superintendent. They use in connection with the furnace, a refining furnace and a large "calciner," weighing 6,600 lbs made by Goddard & Co. of S. F. The bullion is shipped to Myers & Co., and sold mostly to Thos. H. Selby of the San Francisco Lead Works.

The Jackson Mins. has 16 men employed sinking three shafts, respectively 80, 90 and 120 feet deep; chambers have been worked out 35 feet wide, 50 feet long and 25 feet high.

Reslin Smelting Works. This company have been running one furnace successfully that turns out 3½ tons of bullion per day. J. M. Roberts is general superintendent. They own 160 acres of land and a large number of mines near by; the Hamburg, Helena, Elise and Tip Top, are the principal ones.

Diamond District is in the Diamond range of mountains, about 18 miles N. E. of Eureka City. One of the well-known mines that is being worked at present is the

Champion. There are three veins running parallel; the shaft is 100 feet deep, all in a vein from 18 inches to four feet wide. The lode is

three feet wide at the bottom. They have 250 tons of ore on the dump. The owners intend erecting a smelting furnace. The best of pine timber and good water are found in the immediate vicinity. There are numerous other mines worthy of mention in this district, among them Cumberland, Grant, Elsie and Jupiter. It is rumored here that the Metropolitan mill will be brought from Shermantown.

Pinto Silver Mining District. The Maryland mine has been bought by an English company and their superintendent has taken possession. They will proceed at once with the work and erect a mill. The mine is rich and permanent, and the present owners will have no reason to regret their purchase. There are many valuable mines in this district, but want of time and space compels me to defer any report of them.

Mineral Hill District, which is 50 miles from Eureka, is at present a lively one. The mines are turning out well and the place is in a prosperous condition.

Mineral Hill Silver M. Co. This company (limited) is an English corporation, which has invested largely in the mines of this district. Mr. A. J. Hutchinson, of Virginia, Nev., has charge of the business at present. Mr. M. Eissler, of Idaho, is in the laboratory and assaying department, an intelligent gentleman, and one who fully understands his business. The mill has 15 stamps, and an engine of 64-horse power. They have a large Stetefeldt furnace with a capacity of 22 tons in 24 hours. The working results of their process is said to be 92 per cent of the assay value, under the efficient management of Mr. Pringle. The bullion averages 750 fine.

This company are now building a 20-stamp mill near the one that was constructed last year; they will have a Stetefeldt furnace and all the late improvements. The building of the large works is under the direction of the well-known mechanical engineer of San Francisco, H. W. Bordwell. The engine will be 35-horse power—18 inch cylinder. Some 60 men are employed, and it is more than likely, that by the time this reaches you, the mill will be completed. The two mills will then have 35 stamps and 18 pans, and be able to reduce 50 tons per day. A large quantity of high-grade ore is on the dump. They have laid pipe to a spring some two miles distant, and now have an unfailing supply of water for the mills.

The Ores of Mineral Hill. The ore-bearing channels are enclosed in Devonian Limestone. It is impossible to convey a correct idea of the character of the veins; they not forming true fissures, but being only deposits of a very irregular system. It may be well to represent it as an ore-bearing channel of over 300 feet in width, and there are three parallel ore deposits, which are again cross-cut by other veins. The main channel in the Giant, Rim Rock and Live Yankee seems to show a continuous body of ore extending from 22 to 30 feet in width. The ore extracted from these claims averages higher than that of those lower down the hill on the west side. The greatest depth reached in the Giant is over 120 feet.

The ores differ greatly; the silver occurring mostly as chloride. Splendid specimens of horn silver, however, have been extracted and black sulphurets of silver occur in large quantities, antimonial sulphide of lead, copper and silver, and argentiferous galena. Different carbonates of copper azurite and malachite occur intermixed with the vein matter and form one of the principal features of the ore of Mineral Hill.

The very rich ore is of a light yellow color and is a chloride of lead and silver containing considerable antimony, kerargyrite and mendipite. Towards the lower side of the hill (west) are found many claims, only to a small extent explored, containing base ores, some of which will pay to smelt, but owing to the absence of reduction works no encouragement is given for further development.

Principal Mines. The Silver Queen, Vallejo, Champion, Grant, Rim Rock, Live Yankee, Mary Ann, Maggie, Great Republic, Pogonip, Troy, and Star of the West are the most prominent mines of the district. The Big Sandy, located on the west side of the hill, has an incline 40 feet long. The prospects for this little camp are very bright and the people are in good spirits. I left Mineral Hill at 5 A. M., and arrived at

Palisades in time for the westward-bound train. A

recent fire at this place destroyed over \$40,000 worth of property. Sissons, Wallace & Co., the principal merchants, lost heavily. As a forwarding point to the interior, this place is rapidly increasing in importance. Mr. W. E. Griffin, W. F. & Co.'s agent, tells me that during three months of this year the amount of freight shipped from here was as follows: Merchandise, 4,613,072 lbs.; grain, 1,417,653 lbs.; lumber, 503,750 feet; shingles, 494,000; bullion, (crude) 2,756,571 lbs., and fine \$226,866; express freight, 38,283 lbs., and flour 174,700 lbs. It goes principally to Mineral Hill, Eureka, Hamilton, and other mining districts. Under the stimulus of railroad transportation the forwarding business has been greatly increased.

W. H. M.

Rains and Climate of San Joaquin Valley.

EDS. PRESS:—As the rain table for our portion of San Joaquin valley is now completed for the past three years, allow me to send it to you, for insertion in your columns with accompanying remarks. Though the remarks contain some facts familiar to most of your California readers, they are communicated with the hope that they may be of some interest to your more distant readers, who are seeking information about the soil and climate of our State.

Our place of observation is near Turlock post-office, Stanislaus county, which is 13 miles by the San Joaquin Valley Railroad, southeast of Modesto. It is some 45 miles southeast of Stockton, and 80 southeast of Sacramento. Taking the latitude and longitude of Sacramento as a guide, and the elevations shown by the railroad survey, its correct position is about latitude 37° 27', longitude 120° 55'; high above the sea 130 feet.

This point is in the midst of an extensive farming region, adapted (without irrigation,) only to small grains. It has been proved satisfactorily, however, that with irrigation there are but few useful plants which may not be cultivated here successfully. Our locality is on the treeless land plains, nine miles south of the Tuolumne, nine miles north of the Merced, and 10 miles east of the San Joaquin rivers, there being no native growth of trees or shrubs nearer than those streams. It is also about midway between the foothills of the Sierra Nevada and Coast Range mountains. Geologically, our soil is alluvial, bordered by tertiary to the eastward.

Our monthly rains since September, 1868, in inches and hundredths, have been as follows:

MONTH.	1868.	1869.	1870.
September.....	0.60	0.00	0.00
October.....	sprinkled	1.19	0.25
November.....	0.95	0.49	0.32
December.....	2.83	0.89	1.89
Total for each year to Jan. 1st....	3.78	2.67	2.46
	1869.	1870.	1871.
January.....	2.62	0.89	0.29
February.....	3.53	2.79	1.44
March.....	3.54	1.17	0.31
April.....	0.99	1.00	1.65
May.....	0.65	0.00	0.46
June.....	0.00	0.12	0.02
July.....	0.00	0.00	spr'kld
August.....	0.00	0.00	spr'kld
Total for each wet season.....	15.11	8.64	7.21

A steady falling off in the amount of rain will be observed for the past three years. In '70 and '71 there was less rain than in any season since '50 and '51, in California. Still what little rain there has been was so well distributed as to make more grain than in the dry year of '63 and '64.

The mean temperature of our climate is probably not far from 66° Fahrenheit, as that is the temperature of our well water at the depth of 20 feet. The highest temperature observed in the shade at this point during the past three years was 110° in July, 1870; lowest, 16° (above zero) in December, 1868. For 1871, lowest temperature, 23° in January; highest, 107°, in June. If the mean of these four extremes be taken, it is 64°, or nearly the mean indicated by our well water. We may then, perhaps with safety, give our mean annual temperature as 65°.

All measurement of rain and temperature given above were made with standard rain gauge and thermometer, approved by the Smithsonian Institute at Washington City. We rarely have any winds except from the northwest and southeast, those from the northwest prevailing the greater part of the year. Our rains are produced in a

very uniform manner. First come heavy northwest winds, which continue sometimes from two to five days, followed by heavy southeast winds continuing sometimes two or three days. Then comes the rain. In our heaviest rains the clouds move almost invariably from the southwest. At the conclusion of each rain, in the "clearing up showers," the wind shifts first to the southwest and then to the northwest—so long as it continues from the northwest, we need look for no rain. Evidently the rationale of our rains is this. The heavy northwest winds rapidly fill our valley with the warm and humid air from the Pacific. Then our cold southeast winds from the snow-clad Sierras and cold tablelands beyond, condense this moist air below the point of saturation, and the surplus moisture is deposited as rain. But why our winds blow so steadily from the northwest and southeast is not so clear. It is a well understood principle of physical geography that westerly winds predominate on the western coasts of continents, because vast masses of water lie to the westward of them; but why on our Pacific coast, these assume so uniformly a northwest course, is a question well worthy of further inquiry, as is also the question, why does the wind blow so steadily from the southeast, when the reaction takes place.

Can the conformation of our vast valley of the Sacramento and San Joaquin have anything to do with it, enclosed as it is between the two great barriers of the Sierras and coast range? Is it possible that the northwest and southeast direction of our long and lofty mountain ranges can give a corresponding trend to winds which would otherwise be westerly and easterly? Which are most prevalent on the Pacific beyond our coast, west or northwest winds? If northwest, then, our inland wind currents must be a part of a great oceanic system of winds, but, if west, then must the direction of our winds be modified to a great extent by the trend of our mountain-girt coast and valleys.

With regard to our rains, from an agricultural point of view, the attention of agriculturists elsewhere will be arrested by the fact that with so small a rain-fall during the year, we can raise any grain in California.

At Sacramento, as shown by Dr. Logan, and at this point, the amount of rain for the winter of '69 and '70 was less than nine inches; for '70 and '71, less than eight inches.

Dr. Logan proves by a rain table beginning in 1849 at Sacramento, that the greatest rain-falls in our valley any winter during that time, have been from 32 to 36 ins., and that our average yearly rain-fall for 22 years is 19 inches.

As these two points have a like situation with regard to the Sacramento and San Joaquin rivers and their continuous valley 500 miles in length and from 40 to 60 miles wide, their annual amounts of rain may be taken as a type of the relative amounts throughout the State, although the rainfall is invariably greater nearer the coast and along the foot-hills of the Sierras.

Still with less than eight inches of rain in our valley the past winter, California has raised, according to our most reliable authorities, a surplus of 100,000 tons of wheat and barley, so large was the amount of acreage sown. But the same authorities estimate that we might reasonably have expected a surplus of 600,000 tons.

So our present surplus is but one-sixth of what we might have expected an average season, and our harvest for 1871 may be recorded as yielding not more than a fifth of an average crop.

Yet, does it not speak well for the soil and climate of California that they will make grain, when the entire rain-fall for the year in our valley is less than eight inches?

Who can measure the capacities of our soil, when we have a series of wet winters and reliable system of irrigation? J. W. A. WRIGHT.

Turlock, Stanislaus Co., Oct. 10, 1871.

PAY YOUR POSTAGE.—We have had a few complaints from parties that claim to have sent us notices from whom no letters ever arrived. Lately, from one such person, we have received a letter which had been held over a month from the careless omission of a postage stamp. We presume many supposed miscarriages of letters can be thus accounted for.

A THOMPSON ROAD STEAMER is now employed in hauling lumber for Wm. P. Dougherty & Co., from their mills in the Santa Cruz mountains to their lumber yard in San José.

# MINING SUMMARY.

The following information is condensed mostly from journals published in the interior, in close proximity to the mines mentioned.

## California.

### ALPINE COUNTY.

**ALPINE MINER.**—Oct. 21st: The Battery blocks of the monitor & N. W. Mill were in position this week. The 10 stamps now to be put in will do the work of 20 old-fashioned slow droppers.

The frame of the Schenectady Quartz Mill is up and hoarded and the shingling begun this morning—91,000 are to be used in covering it.

Steam hoisting works for the Globe mine, and almost the entire machinery of the Schenectady mill, are supposed to be at Reno, or between there and here, by teams.

**GETTING READY.**—*Alpine Chronicle*, Oct. 21st: The Exchequer folks are getting ready to start their quartz mill. The mine is looking finely, and daily improving.

### AMADOR COUNTY.

**DOWNS MINE.**—*Amador Dispatch*, Oct. 21st: The mill is lying still on account of the scarcity of water—as is the case with a number of others in the county. About 800 tons of good looking rock are piled up near the mill awaiting reduction, and there is plenty more in the mine.

**KENNEDY.**—The mill has been undergoing repairs for several weeks. It will be ready to crush again next week. The rock taken out of the mine looks as rich as ever.

**KENNEDY MILL.**—*Amador Ledger*, Oct. 28th: The mill is once more in operation. During the summer the Co. has been engaged in "sinking" and placing the mine in working order. They are now able to keep the mill supplied with an abundance of rock for a year to come.

### BUTTE COUNTY.

**CLEANED OUT.**—*Butte Record*, Oct. 28th: During the week there have been several Chinamen engaged in cleaning out and deepening the ditch, which extends from the mines near the bluffs, in the southern suburbs of the town to the river. It is thought the mines along the bluff will pay well this winter, if a sufficient supply of water can be obtained.

**STREET MINING.**—For some days past there have been two Chinamen engaged in mining, with the old-time rocker, the ground in front of the U. S. Stable, making about 50 cts. per day each.

### CALAVERAS COUNTY.

**ANGELS.**—*Cor. Calaveras Citizen*, Oct. 28th: A young man (an Italian) was killed at the Angels Quartz Mine on the 19th. He tried to jump across a shaft 200 ft. deep, fell in, and was drowned, as there was 8 ft. of water in the shaft.

New hoisting works will soon be erected at the Sticles Mine. Ten or 15 men are laying the foundation.

**Calaveras Chronicle, Oct. 28th: Hadler & Steger have struck a fair prospect; rock looks well, but they have to contend with water and the probability is that their ground will prove excessively hard.... Carlton's mill has been running but one arastra during the summer; rock paying from \$3 to \$9 per corg.... Reed & Hilary are crushing; their ore will average \$70 per ton.... Four miles below the head of the Butte ditch the water in the North Fork of the Mokelumne fills a flume 4 ft. wide, 5 inches deep—the flume having a fall of 3 inches in 12 ft.—being more than the same stream afforded in the fall of 1860.**

... Harris' mill, at Sandy Gulch, has been running steady nearly all summer.... Pascoe & Temby, have made an arrangement with Ross, Ham & Crosby to work the lead known as the "Daniel and Pap," one of the best mines in the Dist., the rock paying \$86 per ton.

**GWIN MINE.**—The main shaft has reached the depth of 520 ft.—as far as it is intended to sink at present. Preparations are being made for running the 500-ft. level. The ore is richer at the bottom of the shaft than any previously taken from the mine and the vein wider.

### EL DORADO COUNTY.

**MINING NEAR PLACERVILLE.**—*Mountain Democrat*, Oct. 28th: From Coon Hollow to Texas Hill, on the south side of Hangtown Hill, the miners are busy "cleaning bedrock," with good prospects, considering the great scarcity of water. Most of the claims for a distance of 4 or 5 miles are now well developed and opened. Alderson & Co., Webber & Co., Green Mt., Pascal & Co., Prideaux & Bro., Parker, Loomis & Duncan, are all ready to do heavy washing, providing they can get plenty of water. On the north side of the

hill some claims are doing exceedingly well. Dickerhoff & Goin are cleaning up 100 oz. every 2 weeks, and a good prospect for a continuance. McDonald & Chamel's claim is beginning to pay well. The old Lyon claim, is paying first rate. On Spanish Hill there is not much doing for want of water—all are complaining of its scarcity. On the Porphyry lead, Quartz Hill, and Poverty Pt., the miners are making wages. The old Pacific mill will be started up within 2 weeks. The Supt. has gone below to make arrangements for starting it, the intention being to run for and sink on the old lead or in the old works. Shepard & Co. are running for gravel and expect to strike through soon, when they will start their mill.

### INYO COUNTY.

**SILVER SPROUT.**—*Inyo Independent*, Oct. 21st: The Co. design to move the mill to a point further up the cañon, known as Onion Valley, which will place it directly below and distant about three-fourths of a mile from the mine. In the spring a wire suspension tramway will be erected for the transportation of the ore from the mine.

### LOS ANGELES COUNTY.

**SAN FRANCISQUITO CANON MINES.**—*Los Angeles News*, Oct. 21st: These alluvial deposits are worked almost exclusively at present by the "dry" process, no natural streams of water being within reach to wash the dirt. Mining operations are conducted chiefly by native Californians, who are making from \$1 to \$4 per day. A Co. of Irish men have been at work for several years bringing in a ditch to convey water on these placers from the Santa Clara river.

### MARIPOSA COUNTY.

**FELICIANA.**—*Mariposa Gazette*, Oct. 21st: We understand that this mine, recently purchased by San Francisco parties, is to be immediately opened up and put in shape for proper working. A new mill will be erected in place of the ones destroyed by fire this summer.

**CHISPA FOUND.**—J. Madden found a chunk of pure gold in his claim at the head of Sherlocks creek on Tuesday that weighed 20 oz. and is valued at \$360. coin.

### NEVADA COUNTY.

**MINING LOCATION.**—*National Gazette*, Oct. 28th: The Prospect M. Co. have located 2,100 feet on what is known as the Prospect ledge, G. V. township.

**GOING AHEAD.**—Work on the North Bloomfield Co.'s dam and bridge is being prosecuted vigorously. The dam with the large bridge and other property in the vicinity, was destroyed by fire a short time since; 60 Chinamen and 30 white men are employed. The bridge will be completed in a few days, and the entire force will then be at work on the dam.

**PROSPECTING.**—The ridge between Grass Valley and Nevada never was prospected so vigorously as at present. Work is going on above Banner Hill and between the Banner mine and the Pittsburg. The Manhattan and Cunningham mines are being worked and show splendid prospects. The Branch Mint Co. have driven a tunnel 700 feet long, commencing on the south side of the hill and going toward the center. At the end of this tunnel they have struck a fine ledge of quartz. They have now commenced a tunnel from the north side of the ridge intending to strike the same ledge that was found in running the tunnel from the other side of the hill; if they succeed in finding the ledge with this north tunnel they will tap it 300 feet from the surface which will be the deepest tunnel in the county.

**ITEMS.**—The Erie mine in Grass Valley township, promises to be one of the richest mines in the county. From 15 tons of rock recently crushed \$7,419 were realized. The Dartmouth Co., near Grass Valley have completed their new 10-stamp mill. It will be run by water power as soon as the "rainy season" sets in.

**MANHATTAN.**—*Nevada Transcript*, Oct. 27th: As the fire broke, out which destroyed the works, the miners struck some splendid rock which would pay over \$50 per ton.

**MINING ON DEER CREEK.**—The Nevada quartz mine is looking first rate. The incline is down 75 feet and they are working about on a level with the creek. For the last 40 feet the ledge has grown continually better. Its width is from 6 to 7 feet between walls, which are well defined. The rock contains a quantity of sulphurets and a considerable amount of free gold.

**MINING LOCATION.**—Williamson & Co. have located on Sailor Flat Cañon of 500 feet commencing at Williamson & Wagner's south line, and running up the Cañon to the old Union tunnel.

### PLUMAS COUNTY.

**RICH BAR.**—*Plumas National*, Oct. 21st: Mardon & Co. are taking out a moderate quantity of the "necessary article."

F. Miller & Co., on Stony Bar, are working their claim to advantage.

Corkscrew Co., F. Maynard & Co., also on Stony Bar, have struck a "streak," out of which they are making fair wages. It is a strata of dirt deposited on a sand streak, varying from 6 to 10 inches in thickness.

Taylor Hill is being worked with plenty of water for present use, as the Co. are cleaning up.

Bunker Hill is being worked with renewed vigor by Lafoon & Co. The first yield having been rich, it is more than likely they will find a slug occasionally.

**RESUMED WORK.**—The boys on Clermont Hill have again commenced work on their tunnel and are putting things in readiness for a vigorous winter's siege.

**WILL START.**—There is another rumor that the Crescent mine and mills have been sold to an English Co., and that operations are to be resumed this fall.

**PURCHASED.**—The Applegarth Bros. have abandoned their intention of putting up a new mill, this fall on the Indian Valley mine, but have purchased the Whitney mill, formerly located near the mouth of Hough's Cañon, and will move it to their mine. This, with the mill on the mine will give them 44 stamps.

**ARGENTINE.**—Conklin's mill—five stamps and 2 pans—is running steadily, and the rock is paying well. Mr. C. works from 15 to 20 men, and crushes about 15 tons per day. Lowe & Hobart's mill is running regularly, and paying well. J. Malloy has been fitting up some arastras for the purpose of working the sulphurets, which he catches in reservoirs in the ravine below the mills. The sulphurets are supposed to be very rich. Heath & Co. are at work in the gulch below the mills, and are making big wages—\$20 per day to the man. A new Co. are at work at the forks of Greenhorn and Squirrel Creek, and are making wages. Musick, at the mouth of Greenhorn, pays small wages, the year round, but in the long run, is as good as any of them.

**QUARTZ.**—*Butte Record*, Oct. 28th: W. Perkins came down on Thursday, with some gold dust pounded from a small piece of quartz taken from a ledge near the place known as "Palmetto." He claims the ledge as both rich and extensive, and as located the same.

### SIERRA COUNTY.

**GOOD HOPE.**—*Mountain Messenger*, Oct. 28th: Rock from the mine is now being crushed and pays well. A body of rich ore has been struck in the tunnel.

**KEYSTONE.**—The new 20 stamp mill—4 batteries—50 horse-power engine is completed and running on good rock from the lower tunnel; gold being visible in most of the rock. The old mill will be started to crushing rock soon. A contract for 800 cords of wood is just being completed. The Co. intend to work a large force of men this winter.

**A NUOGET.**—G. V. Union, Oct. 28th: A man by the name of Fields, mining on Kanaka creek just below the bridge of the Chips' Flat trail, found a piece of quartz gold, on Sunday that weighed 96 ozs., and was valued at \$1,500. A few days ago he took out 18 ozs.

### SISKIYOU COUNTY.

**YIELDING WELL.**—*Yreka Union*, Oct. 21st: The claim of Larned, Varney & Co., on the Klamath, below the mouth of Scott river, is yielding well. Last week it yielded from 40 to 75 ozs. a day; on Monday last they took out 100 ozs., and on Tuesday 75.

**RICHARDSON'S CLAIM AT HAPPY CAMP.**—This claim is paying from \$1,000 to \$1,200 per week.

**OAK GROVE CLAIM.**—The claim on McAdam's Creek, is paying better now than for years past. A new channel or etreak of pay dirt, has been struck.

### TULARE COUNTY.

**RICH MINE.**—*Visalia Delta*, Oct. 26th: A gentleman has presented us with a piece of rock from the mine of Biggs & Malthy on White River, 50 miles from this place. It fairly glistens with the particles of gold it displays to the naked eye. The shaft in the mine has been sunk about 100 ft., and the vein is very rich at that depth. Arrangements are being made for erecting a mill upon the mine at once. The ore has heretofore been worked by means of arastrae. Rock has been extracted which yielded as high as \$7 per lb in gold.

## Nevada.

### EUREKA DISTRICT.

**MAGNOLIA Co.**—*Eureka Sentinel*, Oct.

24th: G. Bibbins is working 4 men on double shifts, on a fine body of ore, averaging from \$300 to \$500 per ton in silver. It is mostly of milling rock and of a high grade.

**CHATTANOOGA** is the name of a splendid mine near the head of New York Cañon. The owners have a shaft down 75 feet, with a vein from 3 to 5 feet in width, of carbonate ores mixed with galena. They have 40 tons on the dump which will average \$100 to the ton.

**BONDED.**—The Ohio, Michigan, Niagara, Bell, Kitty Price, Mt. Maryland and New Port mines lately bonded are likely to be sold to California capitalists, the bond expiring in 20 days.

**A STRIKE.**—A fine strike was made in the Kitty Pearce mine in Goodwin Cañon a few days ago. The ore was struck at a depth of 20 feet. It is high grade and apparently very abundant.

**PROSPECTING.**—There is more well directed prospecting going on in this dist. now than at any other time during this season.

**FISH CREEK BULLION.**—The first shipment consists of 10 bars weighing 700 lbs. and is valued at \$300 per ton, the product of a few tons of ores melted in McCormick's small prospecting furnace.

**SILVER WEST.**—A shaft is down 14 feet, and within the last few days a fine body of splendid ore has been developed. It has been penetrated 2½ feet and the general appearance indicates that it may continue. All sides of the shaft are in excellent ore, and not a pound of "waste" has been met with in 15 tons placed upon the dump. Average assays show a value of \$189 per ton.

**PROSPECT MT.**—Some very promising mines are situated on this mountain. Among them the Excelsior, X Y Z, and Golden Gate. Recently, a splendid vein of carbonate ore has been developed in the latter. It is at the highest point on the mountain at which carbonate ore has been found. The vein is 14 feet in width, and the ore high grade.

### ELY DISTRICT.

**BULLION SHIPPED.**—*Pioche Record*, Oct. 26th: W. F. & Co. shipped since Oct. 19th, 43 bars, valued at \$86,335.25.

**PIOCHE MINE.**—Shipping the usual amount of ore to the mill, where they have 250 tons, awaiting the completion of the Stetefeldt furnace before it will be worked. The sinking of the shaft is being pushed rapidly and a new station will soon be formed. Work in the lower winzes has been temporarily suspended, owing to the imperfect ventilation at the bottom. The stopes yield a large quantity of good ore.

**WIDE WEST.**—Work was commenced a few days since, and now at a depth of 8 or ten ft. chloride is coming out. The ore is high grade. The vein is of good size, as are all discovered in the immediate vicinity.

**CAROLINE.**—In this mine, several hundred yards to the south of the Lighters shaft, ore \$300 or \$400 per ton has recently been struck at a depth of 40 ft. This vein is of immense proportions. The ledge runs parallel with that of the Panaca, and may be on the same vein—it corresponding in width of vein to that of the Panaca.

**ARRIVED.**—The hoiler for the hoisting engine to be erected at the Pioche mine arrived in town Monday. The capacity of the engine is 26 horse power. The whim will be run as long as possible. The shaft being perpendicular, a cage will be fitted in for hoisting and lowering. The shaft is now down nearly 300 ft. and still sinking; prospecting is being pushed throughout different portions of the mine.

### HUMBOLDT.

**BULLION.**—*Unionville Silver State*, Oct. 28th: Amount shipped from the Arizona mine, since our last issue, was \$7,291.

**ANTIMONY ORE.**—Forty tons of antimony ore has been shipped from Star Dist. to Mill City, during the past 10 days. A considerable quantity yet remains on the dump, which is being got into readiness for shipment to the same point.

**WHEELER SHAFT.**—Work on the shaft, located south of the Arizona mine, has been suspended for the winter. The shaft is down about 115 ft.

### REESE RIVER.

**LANE & FULLER.**—This mine is steadily turning out a considerable amount of high grade ore, and the ledge is looking first rate.

**JANE LEDGE.**—Mr. Author has recently erected a whim on this mine. He is down on the ledge 80 feet, and has commenced getting a medium class of ore in small quantities. The ledge is about 6 inches wide and looks fair.

**VANCOUVER.**—This mine has been leased. They have laid a new track in the incline, erected a good whim and put the mine in splendid trim.

**FLORIDA.**—This mine is being re-opened under favorable auspices.

**WASHOE.**

**BRUNSWICK.**—Gold Hill News, Oct. 23d: The repairs and remodeling of this mill are in advanced stage of completion. The batteries are nearly erected and in line, and will contain 55 stamps in all, capable of crushing 150 tons per day. The pans and machinery are being put in position. The race is a broad, deep, well constructed affair and is nearly finished.

**OVERMAN.**—The hoisting works are completed and the machinery is working perfectly. The shaft is down 155 feet. Since the machinery started up, sinking has progressed at the rate of 5 ft. per day.

**KNICKERBOCKER.**—After 4 years' litigation the owners have secured their claim to the ground by a government patent. The Co. have re-incorporated and have everything in perfect shape to resume work. There is on it near the surface a width of over 200 feet of vein matter, with a pay streak 11 feet wide and assays from \$9 to \$31 per ton. The will begin the work of cleaning out their old shafts and drifts, preparatory to the erection of hoisting works.

**WHITE PINE.**

**WEEKLY SHIPMENT.**—W. P. News, Oct. 21st: W. F. & Co. shipped during the last week bullion valued at \$46,985.31.

**ENRIKHARDT.**—Finding good ore in the open cut. The quality has improved. Will commence shipping to the mill next week.

**WARD BEECHER.**—Hoisting from the Buchanan chamber through the Buchanan drift.

**NORTH AURORA.**—Connection was made with the new Risdale shaft and Risdale chamber, on Wednesday. The Lady's chamber shows about the the same as last report.

**SOUTH AURORA.**—The tunnel is pushed as rapidly as possible. The Mitchell and Trewolla shafts are looking very favorable.

**GENESSEE.**—Work is progressing finely in the drift.

**BEECHER CON.**—Breaking down ore but not hoisting at present. No new developments.

**SILVER WAVE.**—A new contract will be lot for sinking 50 ft. of shaft 5 by 8. No. 4 shaft is looking favorable. The Chenoweth shaft is down 35 ft., and rock working well.

**ASBURY, G. & S. M. Co.**—Pushing the tunnel ahead and running both drifts.

**MILLS.**—International—Running on company rock....Oasis—Running steadily on company rock....Manhattan—Running on Beecher Con. ore....Swansea—Running on South Aurora rock....Big Smoky—Under repairs....Monte Cristo—Repairing break in machinery.

**Arizona.**

**WALLAPAI DIST.**—Prescott Miner, Oct. 14th: The mines are developing finely. The 5-stamp mill is about completed, and hopes of a prosperous mining season are indulged in by all.

**YAVAPAI Co.**—The Vulture 50-stamp mill, Vulture City, is every day producing from \$2,000 to \$5,000 worth of gold.

**Colorado.**

**BOULDER COUNTY.**—Cor. Central Register, Oct. 25th: Heitzer is moving a stamp mill from North Clear Creek, and putting it up to water power at Middle Boulder.

**McKenzie & Morgan** are raising paying ore in large quantities, from number 5 and 6 west on the Boulder County.

**CARIBOU.**—Corning & Co., owners of the Washab lode, Caribou Hill, have made arrangements for sinking the main shaft 200 ft. It is down 30 ft. The crevice is 7 ft. wide, a portion of which is high grade, marketable ore.

The main shaft of the Caribou is now 223 ft. deep; the lode is increasing in richness and width. The reduction works at Middle Boulder are near completion, Prospecting in Grand Island and northward is active. S. Sanders has a new silver vein, one-half mile northwest from the Boulder County, represented as a valuable lode.

The discovery shaft on the Henry Ward Beecher lode is being sunk night and day. A contract has been let that will carry it to a depth of 40 ft. Already mineral prevails so abundantly through the quartz that 16 inches of the vein are being eased.

**NEVADA ITEMS.**—Central Herald, Oct. 18th: W. Nichols, W. Rowe and Fisher & Co., are doing well on their lease of the claim on the Kent county lode. They are raising large quantities of ore which runs high.

The California is still worked successfully in many places. Harper's claim is

looking better than ever. Stalker's claim is working on tribute.

The Kansas continues to furnish the smelting works and stamp mills with its full share of quartz. Lake & Andrews are putting up a frame on their claim and will soon have an engine in operation.

M. Lewis has leased the Whitcomb mill and its 22 stamps; will be running in a few days. Prize hill presents considerable activity. Young, Sayr & Co., are pushing matters on their property on the Sudebury. The Commonwealth Co. on the Prize lode can be relied on for a steady yield of high grade ores. Below the east end of Nevada St. several claims on the Ashtabula lode are yielding rich ore.

**SOUTH PARK.**—Hochstetlin & Manahan, owners of the "War Eagle," have a pile of 60 tons of first class ore on the dump, which runs about \$50 per ton in arastras.

**Idaho.**

**ONEIDA MINES.**—Cor. New North West, Dear Lodge M. T. Oct. 14th: Several Cos. are sluicing and making \$3 to \$5 per day. Two Cos. on Caribou Gulch are making from \$10 to \$25 per day to the man.

A great many are preparing to run drifts into the hills and bars. The gold is worth \$20 to \$21 per oz. Nuggets worth \$13 and \$14 have been found. I prospected Discovery claim in Caribou gulch and got \$1 to \$3 to the pan.

**Montana.**

**THE SMELTING WORKS.**—Helena Gazette, Oct. 16th: Work is being pushed with astonishing rapidity. The frame work is up and the carpenters are busily roofing and closing it in. The building is 110 by 60 ft. and designed for 6 stacks, although it is the intention to erect but 4 this fall.

**UNIONVILLE ITEMS.**—The Hendre mine and mill are not in operation. The National mill is repairing. This Co. is sinking a new incline on No. 4 and 5 west of the Union, known as the Owyhee discovery. The Columbia mill is running steadily. Its 30 stamps are crushing ore from the mine, and also working over along with the ore the old tailings that had accumulated on the dump. In the mine a fine vein of rich ore presents itself. The IXL mine shows a fine body of ore. The mill will start up about the first of next week, its supply of water being temporarily cut off. The Whitlatch mine is not in operation. On the west side of Grizzly Gulch, the Whitlatch mill and the Phila. mill, of 15 stamps each, are crushing rock from Milo Courtwright's mine in the Park, and making profitable returns.

**Utah.**

**EAST TINTIC.**—The smelter at Homansville is running day and night. Pease & Taylor still keep up their work on the Wyoming, with plenty of ore in sight.

Albee & Co. continue to develop the Black Dragon with satisfactory results. S. B. Moore and others continue sinking on the Sunbeam.

The Galena Bed shows 18 inches of galena.

The Shoebridge is second to none in the dist.

The smelter at Diamond has started up.

**EAST CANON.**—The cañon supplies ore for the continual working of one 15-stamp mill, one "Ford's Direct-Acting" steam battery mill and 6 arastras; 3 furnaces have been erected.

Velocipede Co. No. 2 has contracted to furnish 300 tons of ore in S. L. City. The Velocipede is an immense body of "low grade ore." It runs, 40 per cent. lead and from 40 to 50 ozs. of silver. By last report from the Comstock mine, the average of the ore extracted was \$25.67, and the profits \$8 per ton.

**ORPHEUS.**—Owners of furnaces are busily fixing their smelters, so that they will be in working operation all winter. The addition of roasters to the Pioneer and Brevoort mills will soon be finished. New arastras are going up.

For the past few days excitement has existed here on account of the Ida Elmore mine, on the north side of Lion Hill, the owners having struck a big thing. They are 20 ft. in and have already a 15 ft. vein of ore in sight, consisting of chloride and black sulphurets of silver, the average assay being \$411.56, and no base metal. There are 1,200 ft. in the mine. The owners were offered \$25,000, and could have bonded, but refused \$60,000 for ten days.

**DRY CANON.**—North from Dry Cañon are several new mines of note, the Delaware, Nabob, Baltic and Rip Van Winkle, all similar in character of ore, but different as to formation, etc. The Delaware, appears to cut the strata at right angles, a developed vein of at least 6 ft. wide standing almost perpendicular.

# Mining Stock Market.

THURSDAY EVE., Nov. 2d, 1871.

There has been a very moderate business done in Mining Stocks since the last report, and they still continue dull.

The sum of \$55,000, product of six days' run, was sent down last week from the Raymond & Ely mine, making a total for three weeks of \$159,175. Ninety tons of ore were taken from the Chollar Potosi last week, assaying \$40.10 per ton. Five hundred tons of ore were taken from the Savage during same time, averaging \$36.82 per ton. The Natoma Water and Mining Co. have resolved to discontinue their regular monthly dividends for a time, and to devote the earnings of their canals to the further development of their property. They own 12,000 acres of land, between Sacramento and Folsom, and intend to make a vineyard of part of it—the soil being remarkably well adapted for that purpose. On the 31st ult., \$36,694 were shipped from the Chollar Potosi and \$3,878 from the Caledonia mine. Titus F. Cronise has been elected Secretary of the South Eureka Mining Co., in place of J. W. Clark, resigned. The Quail Hill Mining and Water Co. have elected the following Trustees for the ensuing year: G. F. Sharp, (President); T. F. Cronise, (Secretary); and E. F. Dennison.
